

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

CADILLAC

A BUNCH OF "MODEL B" CADILLACS

One half of one day's product from the largest automobile makers of the world. The above lot of machines were produced 60 days after our fire and were made at the rate of over one machine every 15 minutes.

CADILLAC AUTOMOBILE COMPANY,
MEMBERS OF ASSOCIATION OF LICENSED AUTOMOBILE MANUFACTURERS.
DETROIT MICH.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

Unique and Unparalleled

Performance of the Pathfinder

ELMORE

The history of automobiling in America records no more sensational performance than that of the Pathfinder Elmore on the recent trip from New York to St. Louis and return. An ordinary stock car was selected to map out the roads in advance of the endurance run. This tremendous trip of more than 5000 miles over villanous roads was made by the Pathfinder Elmore with a repair bill of only 25 cents, and not a single displacement. Did any car in the endurance run—whether it cost $1000 or $10000—equal this astonishing record of the $850 Elmore?

Send for catalogue and the intensely interesting little book "One Long Jump and Two Short Steps."

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, September 29, 1904. No. 1

TO REDUCE MAINTENANCE

License Association to Grapple the Subject—Far-Reaching Plans to be Considered Next Week.

What should prove one of the most interesting and important meetings yet held by the Association of Licensed Automobile Manufacturers is that fixed for Friday of next week, 7th inst. It is then proposed to at least inaugurate the shaping of a service that will prove of far reaching benefit, not less to the trade than to the individual owners of cars—the reduction of maintenance costs.

This is really the burning subject of the hour. General Manager Day has applied himself to it earnestly, and it has occupied the consideration of nearly all the recent sessions of the organization and of many unofficial conversations. The solution is not easy, but to assist it it is proposed to form at the meeting on the 7th a mechanical branch of the association, consisting of the superintendents and engineers of the various factories represented by the membership. All of these have been invited to attend.

The idea that seems of greatest promise is the standardizing and making interchangeable of certain parts of the various cars, thus reducing experiment and simplifying construction. The tire question also enters largely into the matter, but on this point no definite idea prevails; it is believed that discussion may evolve one.

If the mechanical branch is organized, it is proposed that those composing it shall immediately concentrate their efforts on:

First—Reducing the cost per vehicle mile to a lower point than is possible with any other present means of transportation.

Second—A thorough study of the tire question.

Third—The standardizing of parts within the range of possibilities and making as many parts and fittings interchangeable as possible.

The meeting will be held in conjunction with a dinner at the Central Park Casino.

In the morning, if the weather is favorable, those who attend—and between seventy and one hundred are expected—will be driven probably to the Ardsley Club house, at Ardsley-on-the-Hudson, where luncheon will be served. After luncheon the run will continue across country via White Plains to Travers Island, where the courtesies of the New York Athletic Club will be extended. It is hoped to have cars of each manufacturer in the run, and that opportunities to ride in as many of them as time will permit will be accorded to all. This programme, which includes some of the best roads and most picturesque scenery—doubly beautiful at this season of red and gold foliage—should certainly prove an attraction in itself, and with the Vanderbilt Cup race scheduled for the following day, the combination of important business and entertainment should serve to make the meeting a record breaker in point of interest and attendance.

Plans for Next Year's Yales.

At the annual meeting of the Consolidated Mfg. Co., which took place at Toledo, Ohio, last week, the old officers were re-elected, as follows: E. T. Breckenridge, president; Ezra E. Kirk, vice-president; A. W. Coulter, secretary, and J. B. R. Ransom, treasurer. These officers, with E. W. Tolerton, constitute the board of directors.

It was decided at the meeting to add to the present properties of the company the old plant of the Yost Mfg. Co., 35,000 square feet of manufacturing room. The old Yost structure will be devoted to the building of an entirely new touring car, which the company has decided to put on the market for next season's business.

The company will build 1,000 of the new cars, which will be called the Yale Junior. Besides the Yale Junior, the Consolidated company proposes to put out a large four cylinder 24 horsepower car.

Will Discuss Freight Rates.

On October 4, the day preceding the executive meeting in New York, a special committee of the N. A. A. M. will meet the classification committee of the railroad trunk lines in an effort to gain some relief from the heavy rates that now apply to automobiles. The association has been working to this end for some time, and is well fortified with facts and figures.

G & J CHARGES INFRINGEMENT

Long Threatened Action Against Michelin is Finally Instituted—Patents That are Involved.

Lightning that has long threatened struck on Thursday last when the G & J Tire Co. instituted proceedings against the United States Agency, Michelin Tire Co., a corporation of New York City.

The suit, of course, charges infringement of the G & J patents, in that the defendant "has sold and used and is now selling and using, and has caused and is now causing to be sold and used vehicle wheels and tires embodying in cojoint use an operation the several improvements or inventions described and claimed without the license or consent and against the will" of the plaintiff.

A permanent injunction and an accounting is prayed for.

The complaint, which was filed in the United States Circuit Court for the Southern District of New York, discloses several matters of interest that are not of general knowledge, the wide range of the G & J patents, for instance. These are as follows:

Thomas B. Jeffery, No. 454,115, of June 16, 1891; Thomas B. Jeffery, No. 466,565, of January 5, 1892; Thomas B. Jeffery, No. 466,789, of January 12, 1892; William Golding (Manchester, England), No. 493,160, March 7, 1893; Thomas B. Jeffery, No. 523,314, July 17, 1894, and Thomas B. Jeffery, No. 558,956, April 28, 1896, all of which were duly assigned to the G & J Tire Co.

As "indicating the character of the acquiescence accorded by the public," the plaintiff cites the fact that "every manufacturer of automobile tires of the G & J type in the United States is operating under licenses granted by your orator." The licensees are as follows: The B. F. Goodrich Co., the Hartford Rubber Works Co., Morgan & Wright, Inc.; India Rubber Co., Diamond Rubber Co., Goodyear Tire & Rubber Co., International Automobile & Vehicle Tire Co., and the Fisk Rubber Co. In addition, the Continental Caoutchouc Co., Hanover, Germany, has a license to export tires into this country.

Ernest Hopkinson appears as counsel for the plaintiff.

TIRE PATENTS EXPIRE

British Monopoly Ended and the Kingdom Now an Open Market—Developments Promised.

After October 21 Great Britain will be an open market for the detachable types of tires. It is a half open market now. The British patents on the Dunlop tire expired by limitation on September 16, while the Bartlett patents on the Clincher tire will come to a like end on October 21. The monopoly which has held the British trade and public in its grasp for fourteen years will, therefore, in a little more than three weeks, pass away forever.

The patents referred to are those granted to C. K. Welch, who has long been identified with the Dunlop Tire Co., on September 16, 1890, on a wired-on tire, and to W. E. Bartlett, who was similarly connected with the North British Rubber Co., on October 21, 1890, on a tire of the beaded edge type. These two types have had a virtual monopoly of the British trade. In the case of the Dunlop colossal fortunes were made out of the trading profits of the company. From a humble beginning with six hands and a few thousand dollars of capital, it grew until there are at present four thousand employes, while the capital is $20,000,000. The Bartlett tire, which a few years ago was acquired by the Dunlop company, has been much less profitable. It has always played second fiddle to the Dunlop, and a decade ago was engaged in a life and death struggle with the G. & J. tire over the question of priority. It secured the victory after carrying the fight to the British House of Lords, and by so doing drove the G. & J. tire out of Great Britain. In this country, however, an equally sweeping victory was won by the G. & J. tire. The Dunlop patents in this country do not expire until 1909.

With the throwing open of the British market is expected to come a reduction in the tire prices, which have always been maintained at an artificial level, as well as tremendously increased competition. The makers of the Continental tire, in Germany, and the Michelin tire, in France, are already prepared to supply competing tires, while the host of British rubber concerns, which have with difficulty been held in check during the life of the patents, will make equally strenuous efforts to cut into the Dunlop trade. A reduction in price has already been made by the Dunlop company.

In commemoration of the death of the Welch patent the Dunlop Tire Co. tendered a dinner at the Hotel Cecil, London, on September 16, to some four hundred of its friends, customers and competitors. One of the speakers likened the function to an Irish wake, but predicted that the spirit, typified by the organizer and former manager of the company, Harvey du Cros, would never depart.

As the hands of the clock pointed to midnight, the hour at which the grant expired, Manager du Cros of the Dunlop company applied a lighted match to the official documents relating to the Welch patent, which had been placed on a raised table in front of his chair. The orchestra played Chopin's Funeral March, and as the patent specifications were being reduced to ashes the chairman read the elegy of the Welch patent.

Salesman Sues Illsley for Slander.

Asking $10,000 damages for alleged slander, James R. Bradford, an automobile salesman, brought suit in the Chicago Superior Court last week against Frank P. Illsley, the well known Chicago dealer.

Bradford was formerly in the employ of Illsley, but left the latter and went to work for a rival company. This action is claimed to have started the trouble, and Illsley is said to have circulated the report that Bradford while in his employ had given his present employers a list of Illsley's prospective customers. Illsley is also accused of having said that Bradford had used an automobile placed in the garage for repair. These statements attributed to the automobile manager have injured Bradford's business reputation, he asserts, and have placed him in a bad light with his present employers.

The Bankers Invade Detroit.

What might not inaptly be termed the "Bankers' Convention" was held in Detroit last week, when Arthur Banker, George Banker, A. C. Banker, of Chicago, and C. G. Wridgway, of Banker Bros., New York, were all present. Their visit in force gave rise to all sorts of conjecture, it being whispered that their object was to take over the entire output of one of the Detroit factories. To all questioning, however, the answer that they were merely looking around was the only one vouchsafed.

Weber to Again Expand.

Orlando F. Weber, whose success with the Pope-Toledo cars in Chicago has been little short of phenomenal, is still expanding, being now figuring on the erection of a large building in a choice location on Michigan avenue. The store will have a frontage of 70 feet, be 171 feet deep and two stories high. Mr. Weber has just added the Waverly, Pope-Hartford and Pope-Tribune lines.

Will Make Crowns in Detroit.

The Detroit Auto Vehicle Co., the most promising of Detroit's newer concerns, have absorbed the Detroit Novelty Machine Works and are this week beginning operations in earnest. They will market a four cylinder car to be called the Crown; also a patented spring tire of the same title.

Schug Adds Spark Plugs.

The Schug Electric Mfg. Co., Detroit, are adding to their productions a complete line of spark plugs of all standard sizes and threads.

SIX JOBBERS SUED

Old Patent on Tips for Gas Lamps is Brought to Bear—Other Suits Threatened.

There was a flare up in lava tips for acetylene gas lamps last week. Six New York jobbers found themselves faced with suits, in consequence of litigation waged over the validity of a patent granted on a burner of the type used almost universally on acetylene lamps for automobile and other lighting systems.

The trouble began almost a year ago, when, in the United States Circuit Court of Appeals, an interlocutory decree of the United States Circuit Court for the Northern District of New York, which had been appealed from, was affirmed. The complainant in the case was Moritz Kirchberger et al., who are the representatives in this country of J. Von Schwarz, of Nuremberg, Germany, who, in turn, is the owner of patent No. 589,342, granted on August 31, 1897, to E. J. Dolan, on acetylene gas burners. Kirchberger & Co. import and sell these burners; and upon securing this affirmation they were able to make an arrangement with the State Line Mfg. Co., of Chattanooga, Tenn., under which name D. M. Steward, one of the biggest makers of burners in this country, operates, whereby the Interstate company would take out a license from Kirchberger & Co., and pay them royalty on all burners made by them, the Interstate company.

Upon the conclusion of this agreement the Interstate company raised the gross price of their burners by nearly 300 per cent. This increase, however, figures out at only a few cents per burner.

The raise was acquiesced in by some lamp makers and jobbers, but the majority of them stood out and have since been purchasing their tips from other makers not licensed by Kirchberger & Co. The latter then, in order to bring these alleged infringing users to terms, instituted suits against six New York jobbers, viz., A. H. Funke, E. J. Willis, Emil Grossman, New York Sporting Goods Co., C. E. Miller and the Acetylene Co. The cases came up in the United States Circuit Court in this city last week and were adjourned.

The Von Schwarz patent is claimed to cover all burners from which is projected a small cylinder of acetylene gas, surrounded with an envelope of air, or a burner having outlets inclined toward each other, from which jets of acetylene gas surrounded with an envelope of air emerge. As practically all burners used in acetylene lamps are constructed on this principle, including both the fishtail and the straight flame styles, the sweeping nature of the Von Schwarz claims will be seen.

A representative of Kirchberger & Co. stated to a Motor World man last week that the suits against the New York jobbers were only the first step in a movement to stop the use of all lava tips not manufactured by them or their licensees. Similar proceedings would, he intimated, be commenced against jobbers in other cities.

LEMP LOSES THE FLUE

Patent Commissioner Reverses Decision in Long Pending Case and Awards Priority to Mudge

An old and much discussed device, to wit, the flue construction used on steam automobiles, came in for an airing before the Commissioner of Patents at Washington recently, and it is reported in the current Patent Gazette. The device in question is covered by a patent granted to Richard C. Mudge, September 18, 1900, No. 658,114, and for which Hermann Lemp had filed an application on July 27, 1901, No. 69,904.

The matter came up on an appeal by Mudge from a decision of the Examiners-in-Chief awarding priority of invention to Lemp as to the following issue:

1. The combination with a carriage, of a steam boiler carried thereby and having a burner for heating it, and a flue for disposing of the products of combustion from the burner, said flue having substantially horizontal divergent branches, which are provided with outlets to the atmosphere and are arranged on either side of that portion of the flue which connects with the flues or heating passages of the boiler, said branches together forming a through passage for disposing of atmospheric currents which might otherwise reverse the normal draft of the burner.

2. The combination with a carriage body, of a steam boiler carried thereby and having a burner for heating it, and a flue for disposing of the products of combustion from the burner, said flue having substantially horizontal divergent branches extending transversely of the carriage body and terminating in outlets to the atmosphere which coincide substantially with the planes of the side walls of the carriage body, said branches being arranged on either side of that portion of the flue which connects with the flues or heating passages of the boiler, and together forming a through passage for disposing of atmospheric currents which might otherwise reverse the normal draft of the burner.

3. The combination with a carriage, of a steam boiler carried thereby and having a burner for heating it, and a substantially horizontal flue at the top of the boiler for disposing of the products of combustion from the burner, said flue having a middle or enlarged part immediately covering the boiler and a transverse part disposed to the rear of said middle or enlarged part and consisting of divergent branches having outlets to the atmosphere, and together forming a through passage for disposing of atmospheric currents which might otherwise reverse the normal draft of the burner.

It is held that "where it is established that a certain device was made and used to some extent, but it appears that the device was discarded and thrown into the scrap heap and no similar device was again used, but that a new one quite different in construction was made and used and then thrown into the scrap, and no testimony is given as to the successful operation of either of the devices.

Holding to this opinion, the Commissioner says:

"I cannot agree with the Examiners-in-Chief in their opinion that Lemp has established beyond a reasonable doubt that the devices of April and August, 1899, were reductions to practice. On the contrary, Lemp's actions, considered in the light of his testimony and that of his witness, Fisher, clearly show that his devices were not successful in their operation. They cannot, therefore, be given the effect of a reduction of the invention to practice.

"The decision of the Examiners-in-Chief is reversed, and priority of invention is awarded to Mudge."

The Week's Incorporations.

Milwaukee, Wis.—The Milwaukee Motor Co., under Wisconsin laws, with $25,000 capital. Corporators—F. L. Ford, Edgar E. Warner and A. W. Warner.

Danville, Ill—Kelley-Bridgett Co., under Illinois laws, with $5,000 capital; to manufacture automobiles. Corporators—E. J. Kelley, W. M. Bridgett and G. T. Buckingham.

Chicago, Ill.—Mason-Harvey Co., under Illinois' laws, with $2,500 capital; to manufacture and repair automobiles. Corporators—W. W. Harvey, W. R. Mason and A. A. Hedges.

Springfield, Ohio—The Laminated Automobile Frame Co., under Ohio laws, with $10,000 capital. Corporators—Orrin L. Parsons, C. C. Bramwell, Horace C. Keifer, W. W. Keifer and George C. Lynch.

Syracuse, N. Y.—The Ames-Pierce Automobile Co., under New York laws, with $1,000 capital; to manufacture and deal in motors, engines, etc. Corporators—C. L. Ames, H. C. Pierce and G. H. Dennison, Syracuse.

Washington, D. C.—The Eleanor Automobile Co., under District of Columbia's laws, with $300,000 capital. Incorporators: A. von McCallister, B. A. Horst, Robert McElroy, Messrs. Frere, McLaughlin, L. T. Sverett and Ochsenreiter.

Toledo, Ohio.—The Indiana Scale & Truck Co., under Ohio laws, with $100,000 capital; to manufacture trucks, scales, automobiles, bicycles and other vehicles. Corporators—Samuel Snell, R. B. Dakin, G. F. Miller, sr., John Renner and R. Fuller.

Plainfield, N. J.—Hyne Motor Co., under New Jersey laws, with $25,000 capital, to manufacture and deal in motor vehicles. Incorporators: Harrison Coddington, North Plainfield; Charles P. Fulmer, Plainfield; Charles F. Hyne, North Plainfield; William B. Harsel, Plainfield.

Aultman in Receiver's Hands.

The big Aultman Co., of Canton, Ohio, which went into the hands of a receiver last week, had been preparing for a year or more to embark in the automobile business; several experimental cars had been built, but nothing came of them. It is estimated that the concern's liabilities will reach $1,500,000.

Addition to Denver's Trade.

The Mathewson Automobile Co. has been formed at Denver, Col., with E. Linn Mathewson as president and Fred. W. Bailey as secretary and treasurer. Quarters have been secured at Nos. 1,420 and 1,422 Court Place. Mr. Mathewson was formerly manager for George E. Hannan.

REFUSED 35c. SETTLEMENT

Columbus's Creditors Wave it Aside and Promptly File Bankruptcy Petition—Liabilities, $70,000.

The embarrassment of the Columbus Motor Vehicle Co., Columbus, Ohio, makers of the Dumont car, which has been a matter of common comment for a month or more, and which was duly noted by the Motor World, reached a climax last week.

Following a meeting of creditors called to consider an offer of settlement of 35 cents on the dollar, and which failed to agree on an acceptance, a petition in bankruptcy was filed by the Interstate Foundry Co., the Hartford Rubber Works Co., Alexander T. Brown and William C. Lipe, as administrators of the estate of Charles E. Lipe, deceased, partners, trading as the Brown-Lipe Gear Co.

George Hedges, attorney for the company, is credited with the statement that the concern's liabilities are about $70,000, but that they are protected by ample assets, and that the concern was not insolvent; that of the $70,000 indebtedness about $40,000 was money borrowed locally, all of which was protected amply by personal security, the remainder of the indebtedness being due chiefly to outside creditors for material.

New Concern's New Top.

A canopy weighing, complete, 55 pounds, is being marketed by the American Buggy Top Co., Jackson, Mich. Although comparatively new, this concern has been markedly successful. It has already booked the 1905 orders of the Ford, Haynes-Apperson and Northern companies.

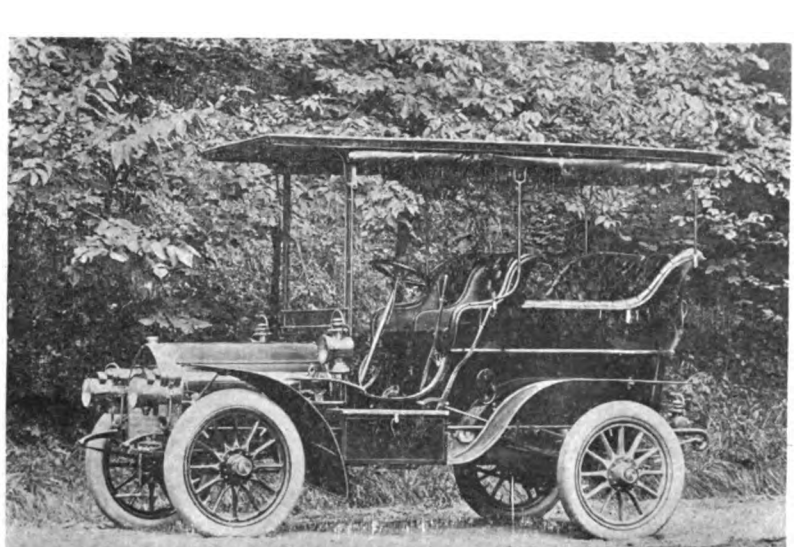
Office in Ohio; Plant in Indiana.

The Indiana Scale & Truck Co., the incorporation of which with $100,000 capital is noted elsewhere, has purchased a plant at Bluffton, Ind., and will operate it from the main office at Toledo. The plant is said to be completely equipped.

Air-Cooled Car from Brockton.

The American Motor Co., Brockton, Mass., is working on a two cylinder air cooled car which will be marketed at about $500. Heretofore the concern has confined itself to the manufacture of the Marsh motor bicycles.

Will Travel for Olds.



C. F. Gilmour, of Buffalo, and C. H. Larson, of Chicago, have been added to the travelling staff of the Olds Motor Works. The former will cover the East and the latter Western territory.

New Tennant Tire Coming.

The Tennant Auto-Tire Co., Springfield, Ohio, have almost ready for marketing an addition to their line of puncture proof tires. A new fastening is one of its striking features.

NEW YORK, SEPTEMBER 29, 1904.

The Numbering Fallacy Exposed.

Of all the miserable and despotic laws which single out for regulation a particular class of private vehicle, that which governs the use of motor vehicles in Massachusetts is without a peer. It places in the hands of the Massachusetts Highway Commission power that is equalled only by that possessed by the Czar of all Russia. It is an offence to loan a car; it is an offence to sell one without reporting the sale, an offence to permit one to remain standing unlocked. The makers and dealers each pay an extra and special tax for the privilege of selling the same automobile, and the purchaser in turn is similarly mulcted. Despite the fact, a particular road in the State may be closed to automobilists, and their right to use the common roads may be wholly revoked at any time within the pleasure of the Highway Commission, while ever must they travel fortified with the tag and bit of paper that guarantees the unmolested exercise of a right that has been made a privilege.

The foundation of the entire law is, of course, the system of registration and numbering which legislators in their infinite wisdom conceive to be the remedy for all evils. From the beginning, the Motor World has inveighed against the injustice of double and triple taxation and the un-American principle of revoking the inherent right to use the public highways, and has as steadfastly maintained that the numbering system is at once a farce and a delusion. Instances without number have accumulated to bear out our assertions, but it has remained for not less than the Massachusetts Highway Commission itself to deliver to the system the worst blow it ever has received.

In the case of L. P. Sims, of Worcester, whose car was arrested—Mr. Sims himself proved that he was at the time in St. Louis, but by a screamingly funny travesty on justice he is, nevertheless, held responsible—for violation of the speed limits fixed by the precious law. But the august chairman of the commission originally appointed to lay out and inspect and improve the public roads, and suddenly clothed with judicial power, ruled also that it is incumbent on constables and their ilk to identify offending cars by more than their registration numbers—in other words, they must be able to describe them with at least reasonable fulness.

Mr. Sims's right to use the common roads, for the maintenance of which he is doubly taxed, is therefore at least temporarily secure.

But the precedent established by the Massachusetts Highway Commission is beyond price. It is more just than the law itself. It takes cognizance of the fact that even Massachusetts constables are human, and may, therefore, err.

But it is a ruling that shatters the whole numbering system as if it were but a house of cards, which is really all it amounts to. The fallacy of it all is laid so bare that even a blind man may feel it. The number is supposed to be of value chiefly in the apprehension and identification of a fleeing offender. If it is necessary to further identify the vehicle, how many men, if serving on a jury and having regard for the duplication of numbers by many States and cities and for the fallability of man, will convict a man charged with an offence under such circumstances? And, as in the case of the offender who does not flee and who is apprehended, the number of his vehicle cuts no figure in the evidence, of what earthly value is it, save as a basis for the extortion of an extra tax ?

The Massachusetts decision holds hope for all men who use motor vehicles, wherever they may use them. It should be made the most of wherever such laws exist or are proposed.

Have the Massachusetts motorists sufficient backbone to use the bomb that has been placed in their hands, and, by shattering the despotic law, obtain those equal rights and that exact justice for which their forefathers fought and died?

The Widths of Bodies.

For some years automobile bodies have been getting larger, until present-day cars are out of all proportion to other vehicles. In spite of the fact that wheel bases have been greatly extended, the bodies of most touring cars overhang in the rear, as well as bulge out at the sides, until the room that once sufficed for them has become quite inadequate.

The matter is attracting attention in widely separated quarters. A week or two ago Police Commissioner McAdoo of this city referred to the matter, and said that he was considering the advisability of asking the Board of Aldermen to limit the size of vehicles. His remarks were called forth by the huge sight-seeing 'buses which ply the streets in this and other cities, and had no reference to ordinary touring cars. Yet some of the latter undoubtedly are transgressors in this respect, as they add to the difficulty—already very great—of handling traffic in the heavily congested centres, as well as of passing other vehicles on the narrow roads that are frequently encountered in the country.

The second note of protest comes from Paris, where, it is said, a radical modification in the body work of the new automobiles is in progress. The once popular pattern known as the "King of the Belgians" is said to be altogether out of favor. It is found that this heavy swaying coach work protruding over the wheels lessens stability and is the cause of many accidents. In the future pattern all bulging will be discarded and the body of the carriage will be well within the wheels.

This is a step in the right direction. There will be some sacrifice of comfort and convenience as a consequence of this contraction of space, but, as automobile bodies will even

Digitized by Google

then be larger than those of horse-drawn ones, there is no reason why the ingenuity of the coach builder should not be exercised to produce something equally as roomy and luxurious, yet without increasing the width.

The Awakening Abroad.

One of the most interesting signs of the times is the increased, or renewed, interest which France and Great Britain are taking in the low-priced car. Every indication points to its receiving, if not the lion's share of attention in 1905, at least considerably more than it has in the past. This is the more noteworthy as it comes at a time when the trend in this country is just the other way—toward bigger and more costly cars.

A few years ago France was in the throes of the voiturette craze. The light and cheap car occupied the centre of the stage, and, in its innumerable and diverse types, filled the streets of Paris and other French towns. They did not give entire satisfaction, however, their comparative crudeness and unreliability operating against them. Consequently they fell into a disfavor, which the coincident marked improvement in the big cars helped to bring about. In Great Britain a somewhat similar experience occurred although there the small car always had a stronger hold on the trade and public than in France.

In both countries the belief is gaining ground that the future of the industry lies in the development of the smaller and cheaper types of cars. This belief found its expression in the English light car trials, which were recently held in place of the open trials for all types of cars held in previous years.

Limited to cars listing at from $650 to $1,000, these trials proved to be a great success, both in calling attention to the number of really excellent cars sold at these figures and in demonstrating their efficiency and reliability. Apparently, there existed a considerable demand for such cars, along with a marked lack of confidence in the ones available. If the trials did nothing else, they dispelled this erroneous impression and produced convincing evidence that people of moderate means, whose views were reasonable, could obtain for $1,000 or less vehicles capable of rendering good service under the most trying conditions. As the larger cars had already demonstrated their ability to cope with the more exacting demands made upon them, the light car trials rounded out the score and gave buyers assurance that the time for hesitation was past.

In both countries the feeling is strong that the output of big cars has about reached the limit of extension. All that can reasonably be expected is the maintenance of its present volume of sales. The number of people who can pay $5,000 or upward for a car is limited, and, while many such have still to become motorists, the proportion already supplied is very large.

On the other hand, the number of possible purchasers of cheap cars is almost inexhaustible. Where dozens or scores of high-priced cars are disposed of with increasing difficulty, hundreds or even thousands of cheap ones will find ready sale, once the public believes that entirely satisfactory cars are obtainable. As long as there is doubt on this point, buyers will hold off in the hope of obtaining vastly improved cars a little later.

Trickery in Second-Hand Sales.

Few trades so readily lend themselves to tricks as those which deal with second hand wares or which prosecute sales on commission bases. It is therefore hardly to be expected that the automobile business will prove immune. There is, however, one practice that is in vogue in certain houses that dispose of old cars on a commission basis that passes the limits of "trade tricks" and approaches, if it does not actually constitute, a crime which should lodge its perpetrators behind the bars.

The "trick" is a very simple one. The man with the second hand car for sale leaves it with the commission man and names, say, $250 as the rock bottom price at which it may be sold. The commission man secures a customer, and, after the usual hectoring, disposes of the car at that figure—or better, if possible. The unscrupulous of the class are then not content merely to pocket the commission and the extra amount obtained, but, with the money already in hand, they telephone, telegraph or write the original owner of the car that they have a buyer in sight, but that he will give not more than, say, $225 for the property. These messages almost invariably wind up with the suggestive notification that an immediate decision is imperative. It is rare that this decison is unfavorable. Immediately it is received the check for $225, less commission, is forwarded. The commission sharper is thus $25 to the good. He probably terms it "finding money." The honest man will view it as a plain case of theft.

How general is the practice we have no means of knowing. We know to a certainty that it is pursued regularly by two concerns, at least one of which, while not usually permitting "pickings" to escape, is not popularly credited with descending to anything so closely akin to downright theft.

The moral is plain. The man with an old car to sell should either sell it himself or assure himself of the character of the man or concern into whose hands he intrusts its sale. In the case of a doubtful house, he should, to make sure that he is not being fleeced by such methods as those referred to, insist on seeing the sales slip or being supplied with the name and address of the purchaser—and then investigating the latter to preventing the "planting" of one to suit the occasion.

Simplicity of Control.

Simplicity of control is the sine qua non of nearly all designers and makers. A great improvement in this respect has taken place during recent years, and each fresh batch of motorists finds the problem a less difficult one to solve.

Opinions differ, however, as to the direction the efforts to obtain simplicity and at the same time retain efficiency of control should take. Practically all designers are agreed on the desirability of supplying a foot-operated brake, the application of which withdraws the gear or in some other manner disconnects the engine and the transmission gear. Among drivers it is felt, too, that the brake that is most used as well as most effective should be foot operated; but on some cars the contrary is the case, and the driver, should he be called on to stop suddenly, makes use of a hand-operated lever for the purpose, thus necessitating the removal of one hand from the steering wheel—a practice obviously dangerous at such time.

There is likewise a strong feeling that cars should be so constructed that the driver's hands need never be withdrawn from the steering wheel while running, except to make speed changes. The practice of operating the throttle and the sparking advance from the wheel originated abroad, and is now in pretty general use. It not only permits the driver to keep his hands on the wheel, but avoids the necessity of taking his eyes from the road; for a fleeting glance can be cast at the appliances on the wheel without really losing sight of the road.

TRYING TO STOP CUP RACE

Long Island Motorphobes Fomenting Trouble—Checkmates Ready and Preparations Complete.

If they can possible encompass it, the People's Protective Association of Nassau County intends to interfere with the running of the Vanderbilt Cup race on October 8. Rumors of coming protests took shape on Wednesday, when the association sent a letter to the Board of Supervisors of Nassau County, containing the signatures of 188 residents, protesting against the board's action in closing the roads on the course during the running of the race. The right of the board to do this is denied, although the statutes of New York State expressly permit such action, and the letter ends with the threat to carry the matter to the courts unless the board rescinds its action.

Trouble from this quarter was not altogether unexpected by the American Automobile Association, under whose auspices the race is to be held. Measures have been taken to checkmate any move that is made. Chairman Pardington, of the A. A. A. racing board, when asked by a Motor World representative on Thursday morning what would be done if an injunction restraining the running of the race should be granted, said:

"Everything that human foresight can suggest has been done. We have engaged counsel and prepared affidavits for submission in case an injunction is granted, and shall at once ask that it be vacated. The only way they can give us serious trouble is to spring the injunction on us at the last minute—say the morning of the race. That would cause some delay, of course. But it is very doubtful whether they can do this. An injunction can be granted only by one of the three judges in this district, and unless some of the facts in the case are concealed when making the motion, I do not believe an injunction will be granted.

"As to a move against us next Tuesday, when the Board of Supervisors meets, we do not fear it at all. The board is with us to a man, and gave us the permission with the fullest knowledge of the circumstances of the case."

As the time for the running of the Vanderbilt cup race, viz., October 8, approaches, interest in this, America's first big road race, and almost the first legalized and regularly organized road speed contest, grows apace. There is now not the slightest doubt that it will be viewed by a huge concourse of spectators, and in view of this fact the most rigorous precautions will be taken to prevent accidents.

There has been a big rush for boxes and seats. There are eighty of the former at $50 each and 300 of the latter at $5 each. Of the former there have been reserved up to to-day sixty-seven and of the latter 225. Twenty-eight miles of the thirty-two-mile circuit are being given a double coating of oil, requiring 90,000 barrels, at a cost of $5,000 for the job. The grandstand receipts are to be devoted to this purpose.

To meet a deficit in the expenses of the race a subscription fund has been started. The subscribers thus far are: W. K. Vanderbilt, jr., $200; Mrs. W. K. Vanderbilt, jr., $100; Mrs. O. H. P. Belmont, $50; H. M. Swetland, $50; George Arents, $50; Long Island Automobile Club, $50.

Among those who have secured boxes are Mayor McClellan, Albert C. Bostwick, F. G. Bourne, M. J. Budlong, E. R. Thomas, H. L. Bowden, P. T. Collier, Clarence Postley, George Isham Scott, F. C. Havemeyer, H. C. Frick, W. Gould Brokaw, Howard Gould, O. H. P. Belmont, Colonel George Pope, Harlan W. Whipple, W. C. Temple, Windsor T. White, James H. Breese, George Arents, jr., Isidor Wormser, jr., Frank H. Croker, George Farrington, Mortimer L. Schiff, Sidney B. Bowman, R. E. Jarrige and Hollander & Tangeman. The executive committee of the N. A. A. M. will attend in a body, arrangements having been made by General Manager Miles.

To prevent speculation in seats and boxes not more than two seats or more than one box will be sold to an individual unless he is known to be a member of some club in the "Three A" affiliation and is vouched for by a member of the commission for 1904. These seats and boxes will all afford a commanding view of the start and finish, the occupants enjoying the benefit of the immediate announcement of times made each lap and of any occurrence along the route.

In a bulletin setting forth details of the preliminary arrangements, Chairman Pardington says:

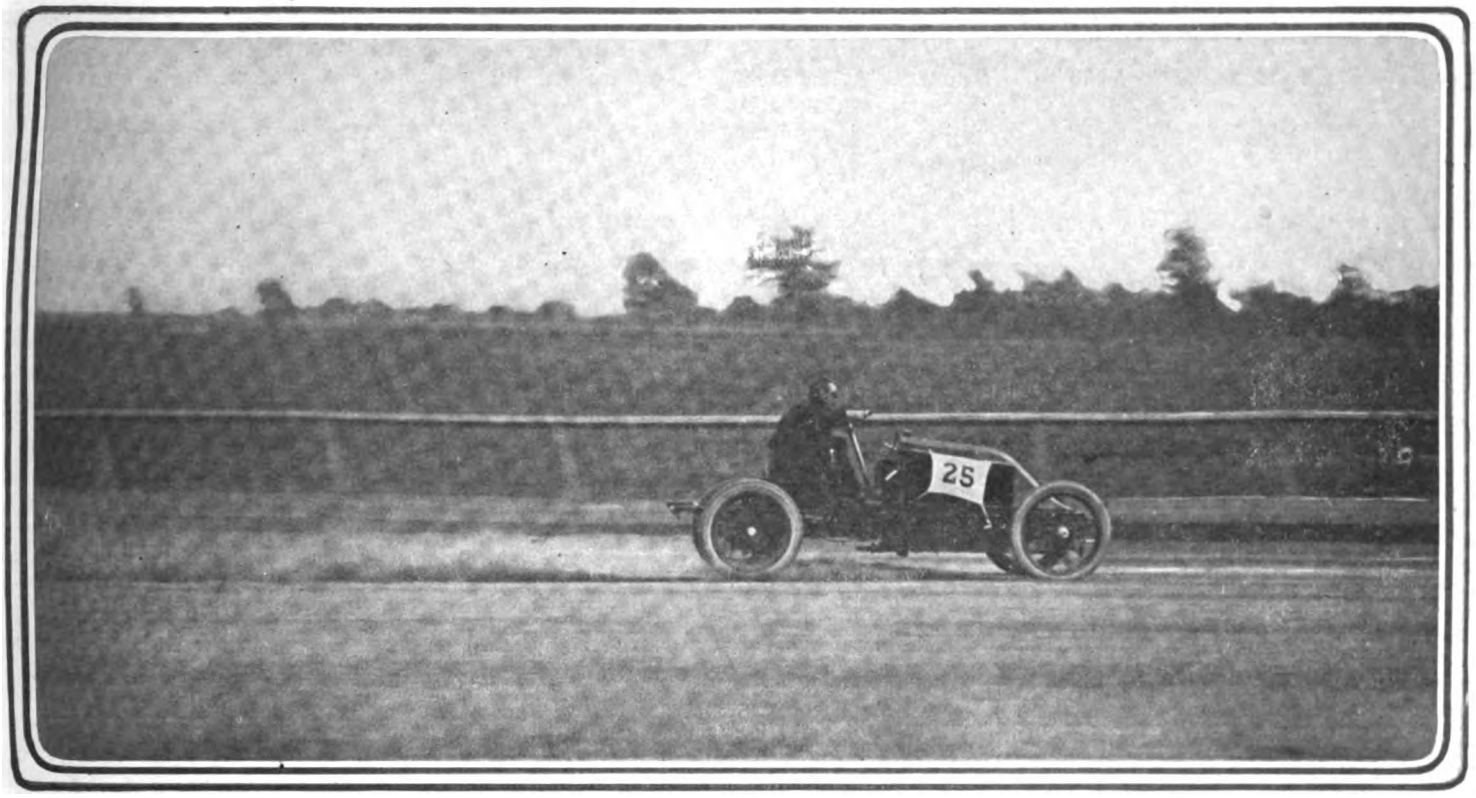
"To prevent the troubles incident to reporting by telephone, which occurred during the Bennett Cup race in Germany, the committee has placed the arrangements of telephonic communication in the hands of the New York and New Jersey Telephone Company, which has assigned an engineer to work out the details. The timers are to have their own telephone system connecting the official stand with the timers, located at the two controls, one at Hicksville and the others at Hempstead.

"In addition to this elaborate system, the judges are to have a system for their own use, connecting the various points on the circuit, particularly at the four turns—Jericho, Plain Edge, Queens-Hempstead and Queens-Jericho. The judges and checkers at these points are to be provided with portable telephones, through which they will be enabled to instantly report to the judges and referee the passage of cars and any other matters which require official sanction or ruling.

"These systems will require about 500 miles of wire and a large number of telephone instruments especially adapted to meet the needs of the commission and officials. To guard against breakdowns four inspectors and repair men mounted on motor bicycles are to be located, one at each of the four turns.

"The course immediately in front of the grandstand and official pavilion is to be kept absolutely clear. No person but the starter and the two technical advisers will be allowed to approach any car before it starts. This precaution is taken to prevent the possibility of accident in the presence of occupants of the stand and boxes. To avoid confusion, only one car will be brought up to the tape at a time, which as soon as it shall have been sent away will be replaced by another, and so on, until the last one shall have departed. Upon the departure of the last starter, the space in front of the stand for a distance of about 400 feet will be kept entirely free of pedestrians. None but officials will be allowed to cross the course, and they only on preceding to one end or the other of the reserved space. This rule will be strictly enforced by building a fence, supplemented by deputy sheriffs vested with full authority to arrest.

"Spectators expecting to reach the stand after the start, at 6 a. m., must, if in cars or other vehicles, go from Jamaica via the Merrick Road, to Rockville Centre or Freeport, thence north to Hempstead, through the six-minute control at this point; thence to Garden City, Mineola, past fair grounds and thence to Westbury. The stand and boxes are within a mile of the railroad station at Westbury. A road runs close to the stand. Arrangement to park cars in a vacant lot near by are being completed.



Another Thomas to Enter Racing Arena.

Dr. Harold E. Thomas, of Chicago, who this season has been driving one of the 16-horsepower four-cylinder gasolene Locomobiles, has been so highly impressed that he has placed with the Locomobile company an order for a 30-35 horsepower four-cylinder limousine car and a special racing machine of 90 nominal horsepower, to be specially built for him from designs of A. L. Riker. The latter will be the first gasolene racing machine to be built by the Locomobile company of America; will have four front vertical cylinders, and in general design will re machine to be built by t ehLocomobile Com- The cost of this car will be $18,000, in racing trim. The Locomobile company state that the building of this costly racing car must not be construed into meaning that they will enter into the racing field, and claim that, whatever any of their customers may do with their cars, they will not take part in track races or long distance road races during the season of 1905.

Baron de Caters has thus early been chosen as one of the Mercedes team in the 1905 Bennett Cup race. He is also contemplating competing in the reliability trials to be held in India this fall.

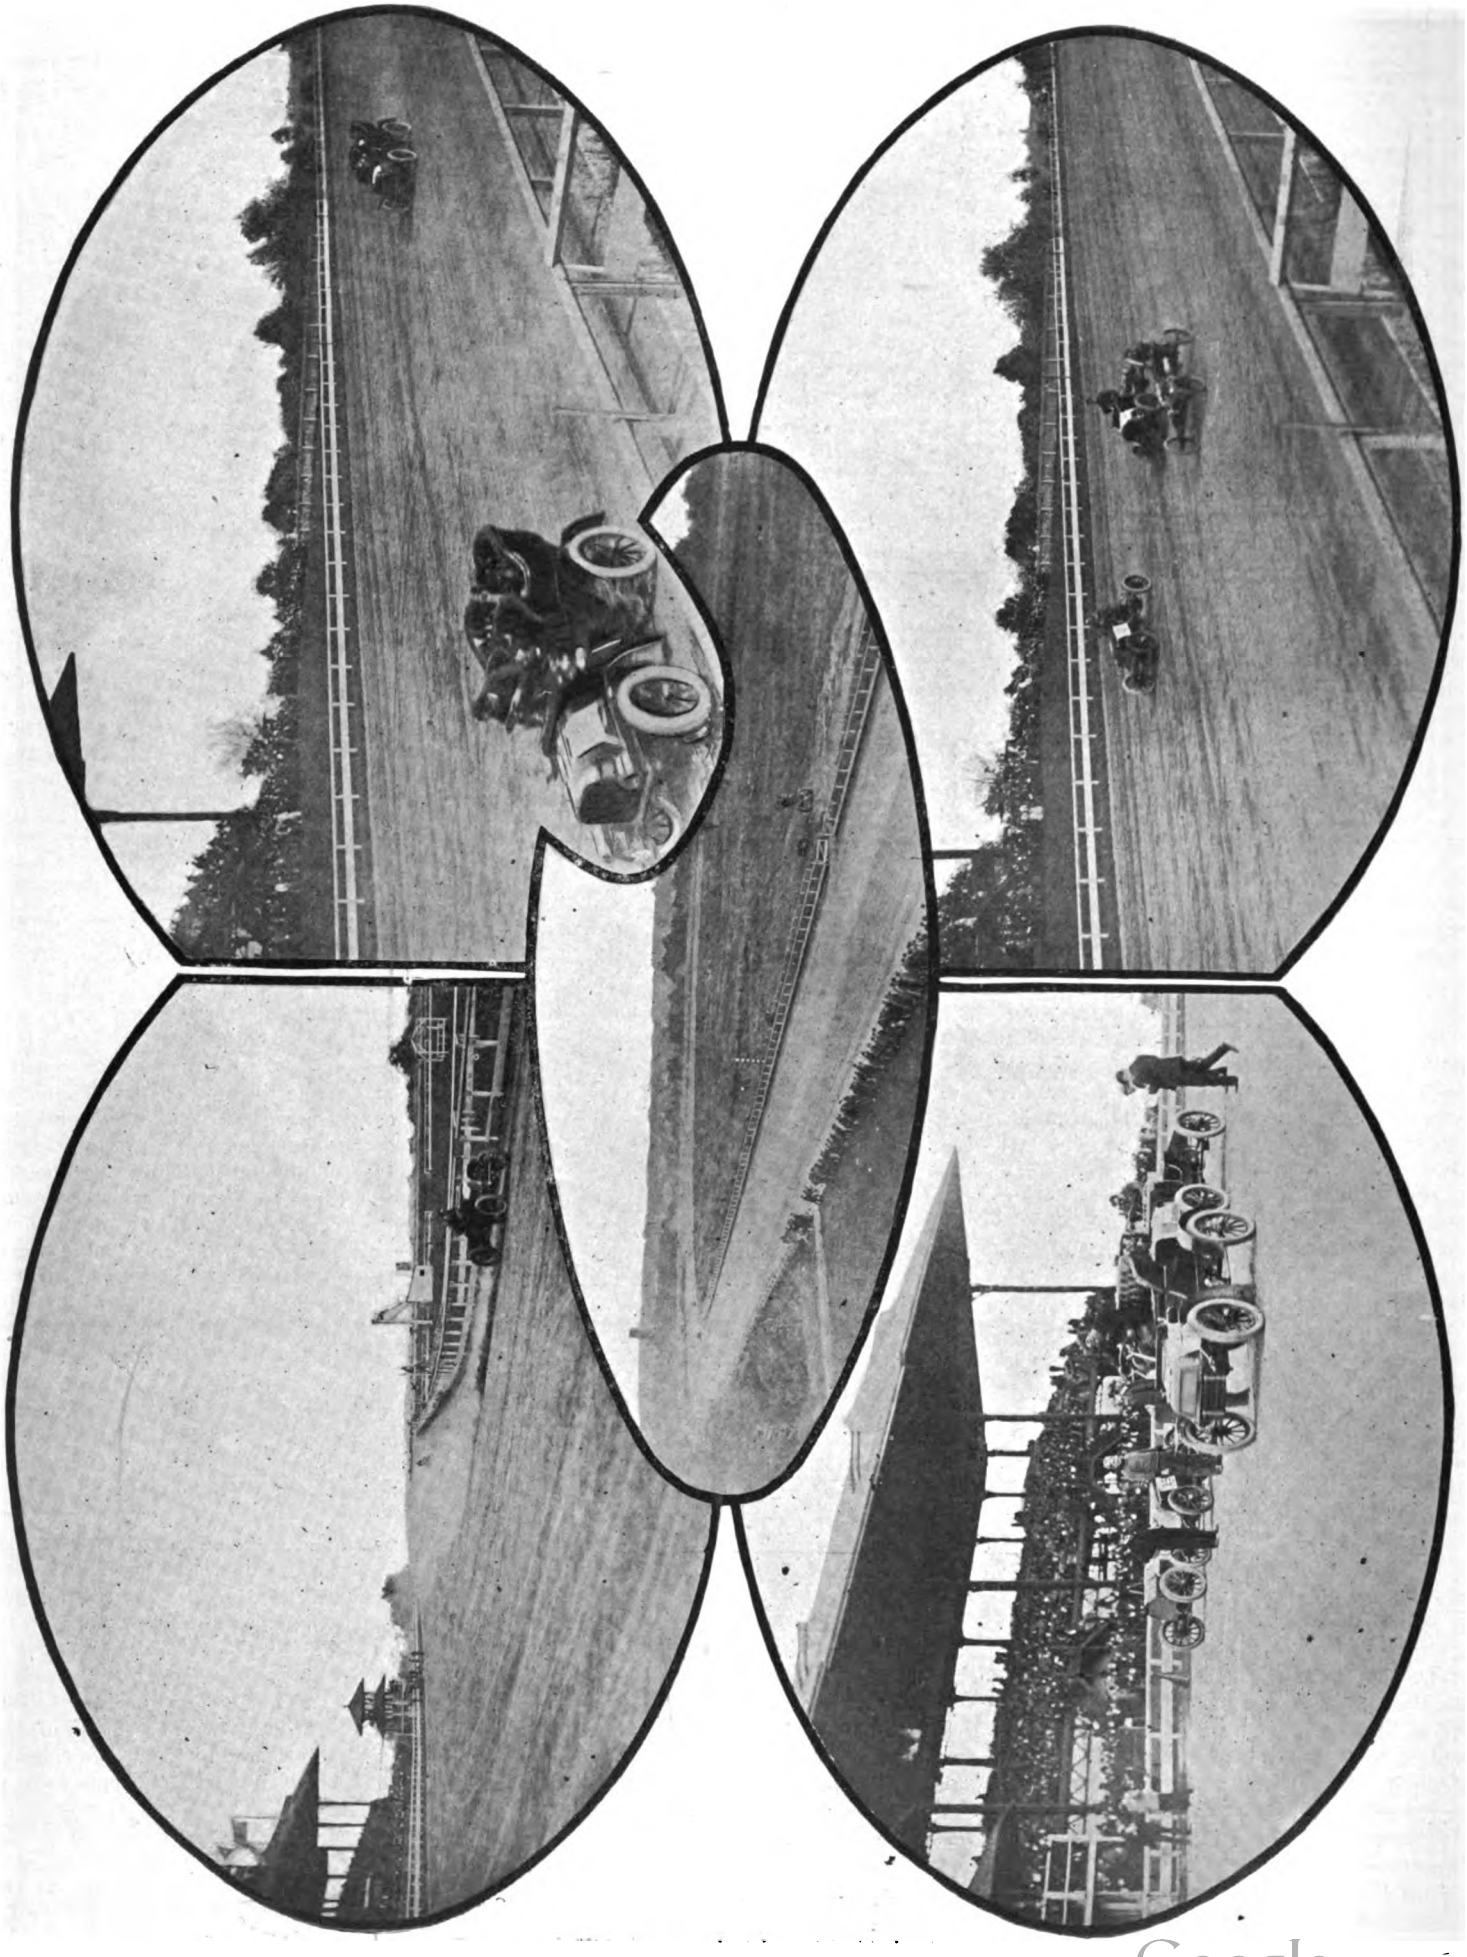
Mile-a-Minute Racing at the Empire City Meet.

JOSEPH TRACY AS HE APPEARED IN HIS RECORD BREAKING FLIGHT.

There are few big race meets nowadays that do not project into the limelight a new star. That at the Empire City track, Yonkers, N. Y., on Saturday, September 24, was no exception. It revealed in convincing fashion the superb skill possessed by Joseph Tracy, a veteran American driver, who is no novice in the racing game. But it remained for the Empire City meet to reveal him in his true colors, to stamp him as the peer of any of the drivers who have acquired fame in this or any other country. The wonderfully clever manner in which he handled W. G. Brokaw's Renault car at once impressed itself on the spectators. It was devoid of theatre tricks or plays to the grandstand; there was no contortioning of the body on the turns, no spreadeagle sweeps to the outside of the track on the straights, to be followed by swoops down on the pole at the turns; no posing before, during or after the race; no jerky driving, but just simple, steady going, that was a marvel of evenness and smoothness. It was just the sort of work to be expected from a plain man like "Joe" Tracy, who was as steady in his seat as a horseman of the plains, and as modest about it as any one could be. His scarlet sweater was the only obtrusive thing about him.

It was Joseph Tracy, too, who was responsible for one of the picturesque features of the meet. He had taken the new Royal racing car in hand and succeeded in Tracyizing it. The result was that when he appeared with the car in the first heat of the Great Empire Handicap he created a small sized sensation. The engine exhausted straight out through the side of the bonnet, and the smoke and the rattatoo of the expelled mixture suggested the discharge of a battery of machine guns. As it sped around the track the eye as well as the car could follow its course. The car was too heavily handicapped to have the ghost of a show, but it gave a splendid performance that augurs well for its future success.



The versatility of Tracy was also shown in this race, when at the finish of the first heat he jumped from the Royal to the Renault and drove it into a place in the final heat.

The meet itself was, although robbed of much of its attraction in a competitive sense by the enforced absence of several of the heralded stellar attractions, one of the most successful and interesting held at the Empire track. A fine day, albeit somewhat marred by flurrying clouds, drew a record breaking crowd to the grounds. Secretary Reeves stated to a Motor World representative late in the afternoon that it was the largest gathering ever seen at an automobile meet in or near New York. The grandstand and the clubhouse were filled, while on the lawn behind the improvised safety "rail" stretched a few yards in the rear of the permanent rail were massed many hundreds more. Conservative estimates place the number of people at close to ten thousand. The outpouring of cars also surpassed all previous figures; parked on the lawns and under and behind the grandstand and in the vicinity of the clubhouse were 450 cars of all sorts and conditions. Filled with attractively gowned women and well dressed men—the typical and hideous automobile costume was less in evidence than usual—they were driven up the smooth, well kept entrance to the track and parked in constantly lengthening rows, while their occupants alighted and wended their way to clubhouse or grandstand. The former was the favorite gathering place of the fashionables, and between the races the scene there bore a resemblance to Fifth Avenue on a bright fall afternoon.

The meet was productive of nine world's records, one of such flights of speed as have marked the appearance of Oldfield and other space devourers on this same track in the past. This means there was good sport a-plenty, including the breaking of middleweight records from two to ten miles, and if the public's appetite for sensational performance was not gratified, it was dismissed in good humor and with pleasant recollections to furnish food for conversation. There were several keenly contested races, while the tidbit of the day, the ten-mile international race, furnished two interesting heats and a final in which two remarkably evenly matched cars—the Brokaw Renault and the Thomas Mercedes—struggled in fine style, one to hold and the other to cut down a slight lead. A too liberal system of start allotting spoiled the handicap race, its result being a foregone conclusion before the final was run.

The conduct of the meet was quite up to the Empire City track standard. Save for a tedious wait before the Great Empire Han-

dicap, occasioned by the cogitations and calculations of the handicapping committee while the cars were at the post, the events were run off with all possible expedition. The time honored experience with non-starting entrants was gone through with, but sufficient cars remained to fill all the events fairly well. The list of absentees included the Bowden 100 horsepower Mercedes and the Premier Comet, which were expected to divide stellar honors with the Thomas Mercedes, and Tod Sloane's 40 horsepower Decauville. The first named was disabled by the cracking of two of its cylinders early in the afternoon, just after covering a trial mile in 0:54. The Comet was put hors de combat by a broken shaft, while the energetic Sloane was halted by an unsympathetic cop while on his way to the track, charged with illegal speeding, and his car temporarily held in pawn. Sloane appeared at the track a trifle late and was obliged to content himself with a view of the contests from the grandstand. The speedy little Ford skeleton, driven by the famous Kulick, proved to have an off day. A run down battery was assigned as the cause of its first failure to equal expectations, and later it was withdrawn, as it was seen that it was not up to concert pitch.

The enjoyment of both spectators and contestants was much heightened by comparative freedom from the dust evil. Rain early Saturday morning had worked wonders, and a thorough wetting of the track at 11 o'clock further contributed to the desirable end. The result was that the small amount of dust raised by the speeding cars was swept away by the brisk breeze that blew all the afternoon, except on the first turn, where several nasty holes became steadily worse as the afternoon wore on, and here clouds of dust arose and were wafted in the direction of the clubhouse every time a car passed.

Robbed of much of its international flavor by the scratching of one of the American teams and the withdrawal of the other, the race for the International Cup had plenty of "ginger" interjected into it by the splendid contest resulting between the French and German cars—the Renault and the Mercedes. Although the former is rated at 30 and the latter at 60 horsepower, they proved to be a wonderfully even match. If the winner, the Renault, excelled at all, it was only by a shade, and for mile after mile the two tore around the track as if coupled by an invisible tow line, so little did the distance between them vary. The victory of the French car is due almost altogether to the fine driving of Tracy. This was made plain by watching the cars on the turns, and particularly on the bad first turn. Hawley, who drove the Thomas Mercedes, drove a la Oldfield—that is, he swept wide on the straights and drew in to the pole on approaching the turns. The bad turn seemed to bother him wofully. He failed to get close to the pole, and nearly always struck the holes and was badly jolted in consequence. In the earlier races he carried a mechanic, who performed that time-worn trick of projecting himself toward the pole on the turns, as if to hold the car down; but in the final heat Hawley came out alone. On the other hand, Tracy held the pole all the way around. He made his gains entirely on the turns, a fact plain to all who watched the two cars.

The first heat of the international race was between the two Italian Fiat cars. Paul Sartori, who will pilot the A. G. Vanderbilt car in the Vanderbilt Cup race next week, drove the car entered by Hollander & Tangerman, while E. A. Riotte performed a like duty for the car entered by E. K. Wallace. After two false starts, in both of which the Sartori car refused to start, they got away slowly in single file, with Riotte leading. The first mile occupied 1:20 1-5 in the running, the Riotte car taking the straights on the outside and closing in on the turns. On the third mile, while on the backstretch, the Sartori Fiat went to the front with a rush, and thereafter was never headed, winning by about an eighth of a mile.

The second and third heats were walkovers for the Thomas Mercedes and the Ford, they being the only cars left to contest for Germany and America, respectively.

The fourth heat was more numerously contested, Joseph Tracy, in the Brokaw Renault, and Felix Froger driving M. C. Hermann's 70 horsepower Panhard, appearing at the post. Froger was the typical Gaul, excitable and theatric. He waved his hand to a compatriot in the grandstand as he went down to the starting point, and treated the spectators to all sorts of pyrotechnics with his car—changing speeds, racing his engine, etc. After a false start, caused by Tracy coming to a stop just before reaching the tape, the two cars were sent off, and Tracy shot away into the lead at once, and at the mile was three hundred or four hundred yards to the good. Froger evidently recognized the futility of pursuit, for he quit on his second mile.

This left Tracy (Renault, France), Hawley (Mercedes, Germany), Riotte (Fiat, Italy) and Kulick (Ford, America) eligible to the final.

THE "WHITE" MASCOT AT EMPIRE CITY.

All of them appeared and were sent away in good shape, with Tracy leading. Almost immediately they strung out, Tracy gaining slightly on Hawley, with Kulick and Riotte in his rear. It soon became plain that the Ford was not behaving properly, and at two miles Kulick withdrew. Riotte was not in much better case, for he fell steadily behind, and at five miles was almost lapped by Tracy, who was about one hundred and fifty yards ahead of Hawley. At six miles Tracy lapped Riotte, who continued to fail, and at the finish was a lap and one-half to the bad. Meanwhile Tracy and Hawley were having a battle royal. Both cars were travelling at nearly the same pace, and the evenness of the running is shown by the time for each mile, as follows: One mile, 1:03 2-5; two miles, 2:02 3-5; three miles, 3:02; four miles, 4:01; five miles, 5:01; six miles, 6:01 2-5; seven miles, 7:01 3-5; eight miles, 8:02 1-5; nine miles, 9:02 1-5; ten miles, 10:01 2-5.

The fourth mile, 59 seconds, was the fastest of the race, with the second and ninth miles, 0:59 1-5, next; while the third mile took but one-fifth of a second more. With the exception of the first mile, these are all new records for middleweight cars. They displace, by a striking coincidence, the records made July 18 last on the same track and by the same Renault car, the latter, however, having then been driven by M. G. Bernin.

From the fifth mile on Hawley made desperate efforts to cut down Tracy's lead, and succeeded in crawling up a few yards. He was unable to make any considerable impression, however, and at the finish Tracy led by fully one-eighth of a mile.

"The indulgence of the audience is begged while the handicappers calculate the starts in the Great Empire Handicap," declaimed Announcer Peter Prunty previous to the running of that race, after it had become plain that there was a hitch somewhere. As the event proved, the spectators' indulgence was needed, not only for the delay, but for the spoiling of the race by injudicious start allotments. The most glaring offences were in the cases of the 24 horsepower Fiat and the 15 horsepower Buckmobile. The former, with 1 minute and 20 seconds start, and the latter with 4 minutes and 16 seconds (why the odd number of seconds was given is a mystery), won their respective heats with ease, and the Fiat, driven by Sartori, finished in the lead in the final by a good margin. A. S. Lee (24 horsepower Pope-Toledo), who started at the same time as Sartori, finished second, while the Buckmobile was third. Tracy (Renault) made a splendid effort to close up, but finished half a mile behind the winner. The first car sent off was the Buckmobile, which had almost completed a mile when the second group—the Fiat and Lee's and Soule's Pope-Toledos—were given the signal. Soule was shaken off, but Sartori and Lee had a desperate struggle for the entire distance. A grand race ensued down the straight on the last lap, but Sartori finally drew away and finished with a lead of about forty yards.

Digitized by Google

The five-mile race for American touring cars was the closest contest of the day. It resulted in a hammer and tongs struggle from start to finish between Charles Soule (Pope-Toledo), and A. E. Morrison (Peerless). They were but a few lengths apart until the last mile, when Soule drew away and won by a scant thirty yards in a splendid finish.

Three cars faced the starter in the ten-mile race for the Knickerbocker Cup, i. e., Joseph Tracy (Renault), Frank Kulick (Ford) and H. R. Lounsbery, jr. (Meteor). Kulick and his Ford were looked to as metal worthy of Tracy's steel, but, as it transpired, the latter had a virtual walkover, and the spectators derived their chief enjoyment from watching Tracy's flawless handling of the Renault flyer. The latter took the lead at the start and drew slowly but steadily away, and at three miles had nearly one-quarter of a mile lead. Shortly after this Kulick dropped out, and as the Meteor had done so sooner the Renault was the only contestant left on the track. Had he known it, Tracy could easily have got among the records, as for several miles he was within a fraction of a second of them, but he repaired the omission later in the afternoon, when, in the international race, he made heavy cuts in them.

In convincing fashion Rodney Peeler (10 horsepower Autocar) won the five-mile race for the Yonkers Cup, open to cars costing $1,000 and less. R. M. Alexander (10 horsepower Pope-Hartford) finished second a long way in the rear, with A. J. Seaton (15 horsepower Buckmobile), third.

Summary:

Five miles, Yonkers Cup, open to cars of any motive power retailing at $1,000 or less—Won by Rodney Peeler (10-horsepower Autocar); second, R. M. Alexander (10-horsepower Pope-Hartford); third, A. J. Seaton (15-horsepower Buckmobile). Time, 8:15 3-5.

Five miles, Old Glory Cup, open to American touring cars, with regular equipment, including tonneau, each car to carry three passengers in addition to the operator; latter to crank car and drive entire distance—Won by Charles Soules (24-horsepower Pope-Toledo); second, A. E. Morrison (24-horsepower Peerless); third, A. S. Lee (24-horsepower Pope-Toledo). Time, 7:12 3-5.

Ten miles, Knickerbocker Cup, open to cars weighing from 881 to 1,432 pounds—Won by Joseph Tracy (W. G. Brokaw's 30-horsepower Renault); second, Frank Kulick (20-horsepower Ford); third, H. R. Lounsbery, jr. (18-horsepower Meteor). Time, 10:15.

Ten miles, International Cup, five mile heats, for cars of each country, free for all—First heat, for Italian cars—Won by Paul Sartori (24-horsepower Fiat); E. A. Riotte (24-horsepower Fiat), second. Time, 6:20.

Second heat, for German cars—Walkover for E. R. Thomas's 60-horsepower Mercedes, driven by E. E. Hawley.

Third heat, for American cars—Walkover for Ford Motor Car Company's 20-horsepower Ford.

Fourth heat, for French cars—Won by Joseph Tracy (40-horsepower Renault); Felix Froger (70-horsepower Fiat), second. Time, 5:08 3-5.

Final heat, ten miles—Won by Joseph Tracy (30 horsepower Renault); second, E. E. Hawley (60 horsepower Mercedes); third, Paul Sartori (24 horsepower Fiat). Time, by miles, 1:03 2-5, 2:02 3-5, 3:02, 4:01, 5:01, 6:01 2-5, 7:01 3-5, 8:02 1-5, 9:02 1-5, 10:01 2-5. New records from two to ten miles. Former records by miles, 2:04 1-5, 3:06 3-5, 4:07, 5:08 1-5, 6:08 4-5, 7:09 2-5, 8:09 2-5, 9:11, 10:13 2-5.

Five miles, Great Empire Handicap, open to all cars: First heat—Won by Paul Sartori (24-horsepower Fiat), handicap, 1:20; second Charles Soule (24-horsepower Pope-Toledo), handicap, 1:20; third, A. E. Morrison (20-horsepower Peerless), handicap, 1:15. Time, 7:30 1-5; net time, 6:10 1-5 Second heat—Won by A. J. Seaton (15-horsepower Buckmobile; handicap, 4:16); second, A. S. Lee (24-horsepower Pope-Toledo), handicap, 1:15); third, Joseph Tracy (W. G. Brokaw's 40-horsepower Renault), handicap, 0:08. Time, 12:38 3-5; net time, 8:22 3-5. Final heat—Won by Paul Sartori (24-horsepower Fiat); second, A. S. Lee (24-horsepower Pope-Toledo); third, A. J. Seaton (15-horsepower Buckmobile). Time, 8:02 1-5.

Pittsburg Offended by A. A. A.

What promises to be a row of no small proportions has been stirred up by the action of the American Automobile Association's racing committee in first granting a sanction to the Automobile Club of Pittsburg for a race meet on Saturday last, which later was cancelled in favor of the Empire City track, at Yonkers, the Pittsburg club agreeing to postpone their meet until Saturday of this week.

President W. C. Temple of the Pittsburg club happened to drop into Chicago on Saturday, and much to his amazement found that the Chicago Automobile Club had secured a sanction for next Saturday—the same date as the Pittsburg meet, and that preparations for a big Chicago event were well under way.

Mr. Temple openly and vigorously denounced the action of the A. A. A., stating that, from the bare facts at hand, it seemed to be a case of assinine stupidity, and that on his return to Pittsburg on Monday the whole matter would be laid before him and decided action taken. Of one thing he was positive, that was that neither himself nor the Pittsburg club would brook any such indignity, and that, unless some valid reason was presented, something was likely to drop. Coming just at this time, when the long-continued efforts of the A. A. A. to induce the Smoky City Club into its fold seemed likely to be crowned with success, the action of the A. A. A. racing committee is particularly unfortunate.

What Not to do When Tires Burst.

Upon incompetent or careless drivers Baron de Caters places the blame for a large proportion of the accidents that are constantly happening.

"My experience is that there are many drivers who never take the trouble to thoroughly examine their machines before a run," he says. "You would be surprised at the easy-going way in which they undertake the difficult task of caring for and conducting an automobile. The ignorance displayed on all hands is quite sufficient to account for all the accidents that take place, and many more that, by a strange chance, do not take place.

"Take, for example, the accidents that arise through burst tires. To burst a front tire is by no means so serious as to burst a rear one. What does the average chauffeur do when he hears a report in the rear and knows something has gone wrong? Why, he applies the brakes, with more or less disastrous results. The fact that one tire has gone causes the automobile to lose its balance, and the application of the brakes causes the whole construction to swing round on the damaged wheel. How many chauffeurs, I should like to know, are acquainted with that fact? When a tire bursts there is no safer course than to bring the machine to a stop by cutting off the gas."

Tests to Reduce Dust Evil.

Dust is one of the British motorist's betes noires, and he is forever seeking some method of lessening its ravages. To this end some interesting experiments were held recently near Guilford.

First of all, a chassis supporting merely the driver and engine, etc., was driven over the track, then various bodies were fitted and tried, and alterations were made above and below and at the sides of the car. Different tires and mud guards were also fitted, and the results accurately noted by means of photography. Two photographs were taken, one near the object and the other some distance away, and in each picture appears a number, which represents the conditions under which the car was run.

For the purpose of judging the back draught, on a line with the top of the tonneau an outrig arrangement was attached, from which white ribbons depended. The disturbance of the ribbons enabled the draught effects to be observed. The road wheels on the car were also changed for others of different diameters.

Renaults to Re-Enter Racing.

Ever since the Paris-Madrid race came to its tragic end the Renault cars have been withdrawn from all road races. The death of Marcel Renault, which, it will be recalled, took place in the race referred to, was responsible for this abstention, which at the time was understood to be permanent. But the concern has decided to re-enter the field, and will next year be represented in all the big races.

FEVER ATTACKS WILMINGTON

Three State Laws Tabloided for Local Use—Its Passage Blocked by Conflicting Authority.

It has remained for Wilmington, Delaware's chief town, to go the limit—and a little beyond it—in the matter of proposed automobile legislation. For some time the authorities have abstained from any attempt to regulate automobile traffic, alleging that in the absence of a local ordinance they were powerless to take action. As a consequence a few reckless motorists have brought the automobile into bad repute by their fast driving.

It is, perhaps, due to this combined inactivity and inconsiderateness that the severity of an ordinance drafted is due. Its drastic provisions are quite beyond anything emanating from a mere municipality. The worst features of the opprobrious Maryland, Pennsylvania and Massachusetts laws have been copied, and the result is an ordinance which, if passed, will make the lives of motorists miserable and stunt the growth of automobiling to an extent that will amount to a positive turning back of the hands of the clock.

Briefly, the ordinance prescribes a registration fee of $2 for the first year and $1 for each succeeding year; requires the display of tags and of numbers on the front and sides of lamps; permits an application for license to be rejected, or a license—that is, the right to use the common roads or even an alley—to be revoked, and borrows from Massachusetts by requiring that unattended machines be kept under lock and key.

The matter is complicated by a conflict between the City Council and the street and sewer department as to which has jurisdiction in the matter, each claiming the power to regulate street traffic.

The recently formed Delaware Automobile Association is taking a hand in the matter with the object of "toning down" the proposed ordinance. The association is not opposed to regulation; it merely wishes it done reasonably and with the least possible interference with the progress of the new transportation vehicle and the rights of motorists as road users.

To this end members of the association last week took the councilmen in their cars for the purpose of giving them an object lesson and convincing them how safe an automobile, properly handled, really is.

Won't Heed Pittsburgers' Protest.

Despite the formal protest of the Automobile Club of Pittsburg, Director McIlvain of the Department of Public Works, of Allegheny, Pa., will insist upon the enforcement of the ordinance passed by councils several months ago prohibiting the operation of automobiles in Riverview Park.

Don't Want Cars Left Alone.

One of the most preposterous ordinances yet proposed is one which the motorists of Tacoma, Wash., are opposing with the utmost energy. The ordinance is denounced as unreasonable in the extreme, and even ridiculous in some of its provisions. The points especially criticised are the speed regulation, the provision requiring that a competent person be left in charge of every machine standing still, and the clause requiring a machine to be stopped at the order of any person driving a horse or team which he fears will become frightened.

The speed limit proposed is eight miles an hour between A and K streets and between North Sixth and South Twenty-ninth streets; four miles an hour on any of the numbered streets running down the hill between Division avenue and South Twenty-fifth street, and six miles an hour on a number of other streets and avenues.

Patee Tests Kansas City's Law.

In order to test in the courts the new Kansas City (Mo.) automobile ordinance, Fred Patee recently had himself arrested and fined, after which he took an appeal. His attorney said that Patee had wilfully violated the law and had then reported that fact to the city attorney, so that prosecution could be begun. He added that the case was intended merely as a test case to establish the rights of the city. Arrests can be made under the ordinance, however, unless the city is enjoined from enforcing it until the test case has been decided.

It was given as his opinion by a member of the city's legal force that the city could enforce the provisions of the ordinance only relative to speed and lights, and that the other provisions would not stand the test of the courts.

Campbell Attacks Oshkosh's Ordinance.

In the case of the city of Oshkosh, Wis., against W. J. Campbell, the validity of the ordinance regulating the speed of automobiles was attacked by Campbell's attorney in the Municipal Court. He placed City Clerk Witzel on the stand and asked him if any other ordinance respecting vehicles had any provision regulating speed in going around corners. The city clerk answered in the negative. The attorney then in his argument attacked the ordinance as being discriminating, and cited several cases in proof of the assertion. He argued the point at some length, and City Attorney Stewart replied.

New Ulm Calls for Horn Tooting.

The Council of New Ulm, Minn., has passed an ordinance that the speed of automobiles in that city shall not exceed six miles an hour, and that a bell or horn shall be sounded when within seventy-five feet of a street crossing, and to be sounded continuously until the crossing is reached, and that automobiles must be provided with lamps or lanterns at night, and that the light must be strong enough to be seen four hundred feet. The penalty for violation of the ordinance is not less than $5 nor more than $100.

JUSTICE OVER-REACHES ITSELF

Bumptious Bay State Magistrate Treads on International Ground and is Forced to Apologize.

One judge has at last discovered some one who is immune from punishment under the anti-speed laws. In consequence, he finds himself in danger of both fine and imprisonment, to save himself from which he has had to make prompt reparation—viz., rescind his finding, remit the fine and make an apology.

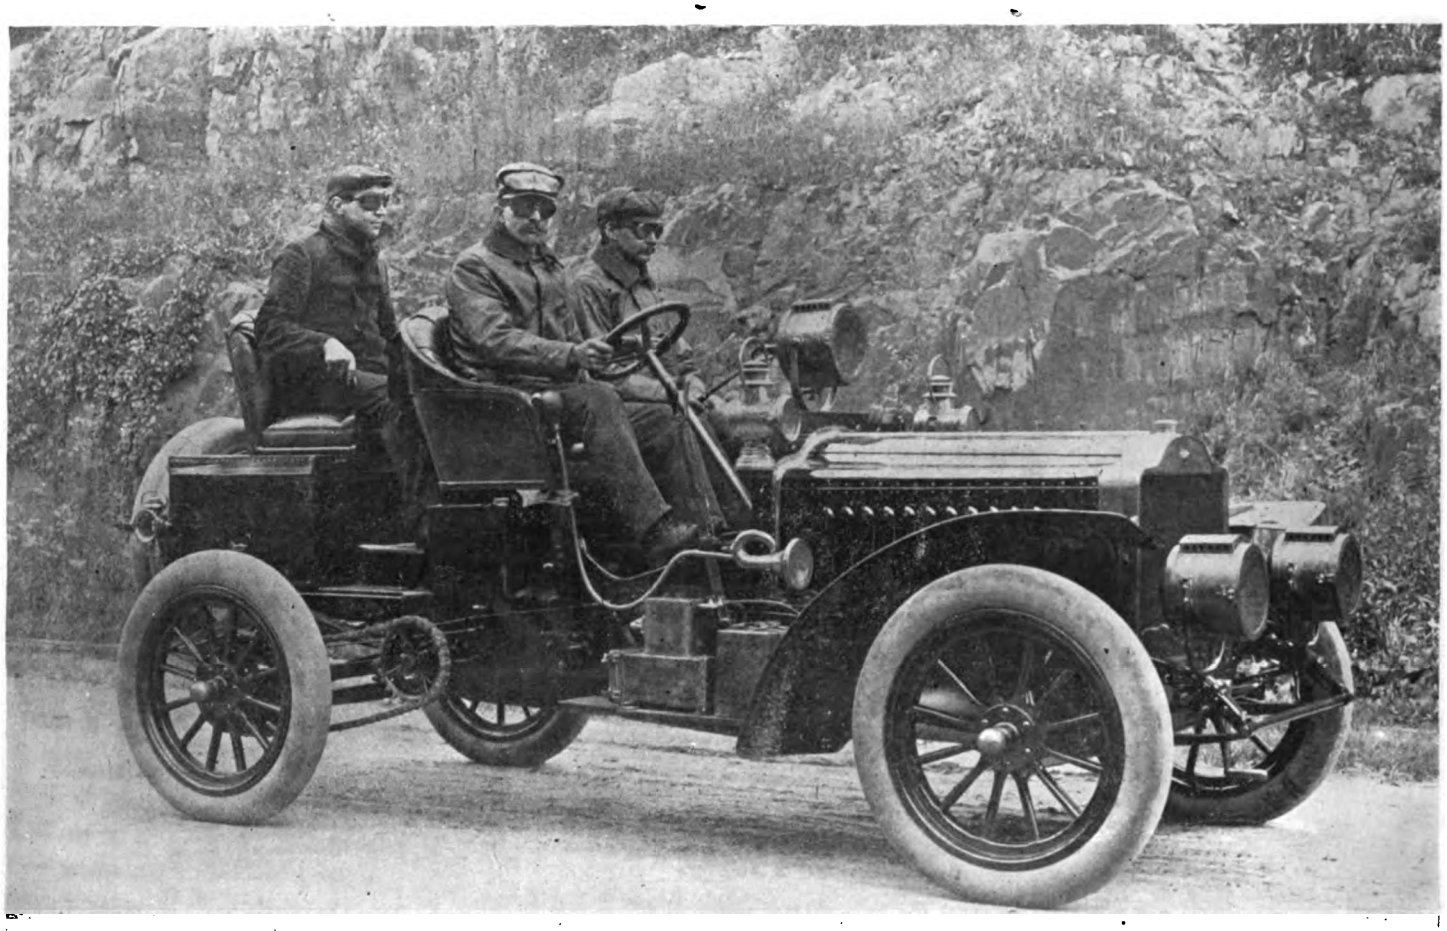
This overhasty official is Acting Justice H. S. C. Phelps, of the Lee (Mass.) District Court. His victim is Hugh Gurney, third assistant secretary of the British Embassy, who has been summering in the Berkshires. Being a British subject and member of the diplomatic corps, he is not amenable to the local court before which he was hauled, charged with illegal speeding. Judge Phelps, who is a manufacturer by vocation and a jurist only in his leisure time, appears to have been unaware of this important fact, and when informed by his prisoner of the sanctity of his person added insult to injury by declaring, in effect, that he did not care a darn, and that he (Phelps) would fine him (Gurney) all the same. Upon Gurney declaring that he would not admit the court's right to sentence him, Phelps fined him again, and threatened to send him to prison if he did not pay.

Naturally, this has stirred up a hornet's nest. Gurney communicated with his fellow diplomats, they with the British Minister at Washington; then the United States State Department was informed of the outrage, when it started hot foot after the Massachusetts authorities, and the acting Governor of that State read the riot act to Justice Phelps. So the latter is in a most alarming predicament.

The telegram from the State Department to Acting Governor Guild of Massachusetts follows in part:

"British Embassy informs me that Mr. Gurney, third secretary of that embassy, charged with driving automobile at excessive speed, was to-day arrested by deputy sheriff and taken, after entering protest, under threats of force, to the court at Lee, when, in spite of his protest, he was sentenced by H. C. S. Phelps, special justice of the Lee police court, to pay a fine of $25, and on his declaring that he could not admit the right of the court to sentence him another fine of $25 for contempt of court and to go to prison if he did not pay."

"The Assistant Attorney General informs me that if the facts are as stated above you have committed, in this particular case, a grave breach of international law.



"Therefore if a fine was imposed and collected, the commonwealth will apologize, the fine must be remitted, and I need not suggest to one so respected as you the personal amend that you will, of course, desire to make to Mr. Gurney for the error in method adopted by your court in this unusual case."

In consequence Justice Phelps, who was at first extremely "cocky," is now ready to eat humble pie. He is quoted as saying:

"I've no disposition to be paraded up and down the case; there's been enough of that already. All that I can say is that if in imposing the fines I was guilty of an error I will gladly apologize when the proper time comes. As it was, I did only what I believed was right."

Columbia Crew That Will Seek to Regain the Chicago-New York Record.

BERT HOLCOMB AT THE WHEEL; LAWRENCE DUFFIE BESIDE HIM; E. C. BALD IN REAR SEAT.

If the weather be favorable, Bert Holcomb, Lawrence Duffie and E. C. Bald, comprising the Columbia crew, will leave Chicago this morning, bent on regaining the Chicago-New York record, which for nearly a year stood to Columbia credit, despite fourteen attacks by zealous rivals. The men, who will take turns at driving the 36-horsepower Columbia car, were to have started on Monday, but unfavorable weather made postponement advisable. The record now stands at 72 hours 43 minutes. The Columbia men, who drove the car from Hartford to Chicago to familiarize themselves with the course, expect to cover the 1,100 miles inside of sixty hours, their schedule as laid out being as follows:

Leave Chicago, 3 a. m.; due South Bend, 8 a. m.; due Cleveland, midnight; due Erie, 5 a. m.; due Buffalo, 10 a. m. W. T.; leave Buffalo, 11:30 a. m. E. T.; due Bath, 5 p. m.; due Binghampton, 11 p. m.; due Delhi, 4 a. m.; due Kingston, 8 a. m.; due Newburg, 10 a. m.; due Weehawken, 1 p. m.

Yesterday morning, W. F. Winchester, in an air-cooled car, left Chicago on the same record-breaking mission.

Real Estate Made Valuable.

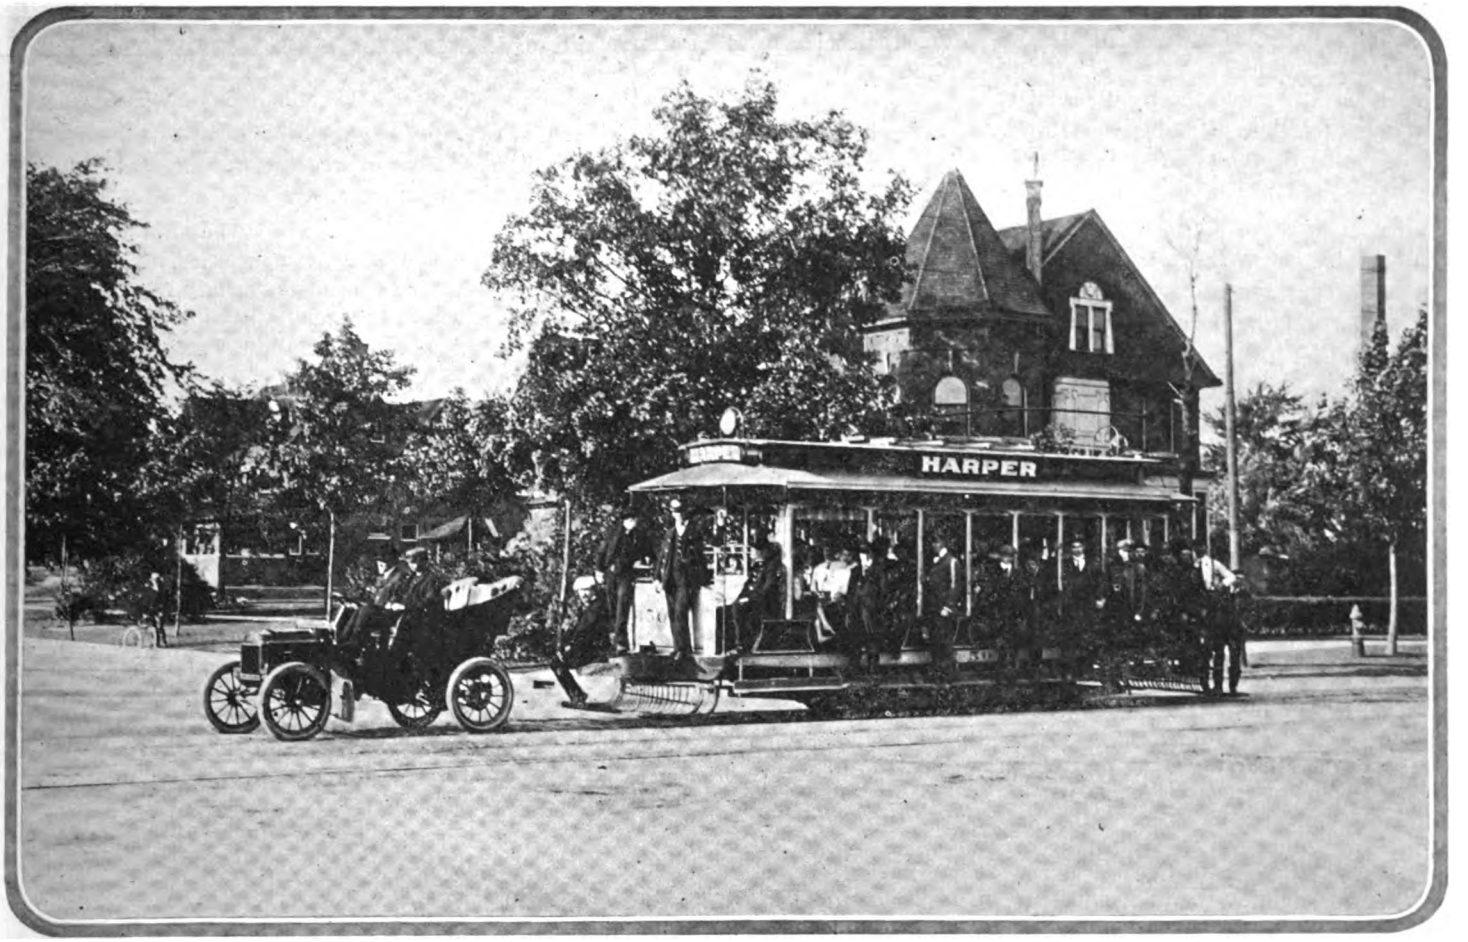
Since the coming of the automobile English house and land agents state that people are no longer unwilling to rent mansions in districts formerly regarded as inaccessible. With the motor car's almost magic agency of transport dwellers in the country cease to consider the number of miles that a house may be from a railway station or town. A lady may do her shopping in a town twenty miles away with as little trouble as she had in visiting one five miles off by means of a horse and trap. She may lunch with a friend at forty miles distance and return home comfortably to dinner.

The motor car has this advantage over the train: That it takes the traveller all the way from his starting point to his destination. Therefore, on a fifty-mile journey one may travel as quickly by car as by train. For, although the train travels faster—sometimes—than the car, the time lost in getting to and from the railway station at each end of the journey annuls that gain. In journeying from London to Brighton, for example, most people are so situated that they could, without transgressing the legal limit, get from house to house by car in very little longer time than by train, with the advantage of starting when they liked and not when the railway time table ordains.

London's School Proves a Success.

So successful have been the elementary classes in automobile engineering at the Battersea (London) Polytechnic that it is proposed to add a class of a more advanced nature. It will probably take the form of an evening class for motor car engineers, which foremen of garages and moderately well qualified men in factories could attend with advantage.

Nashville's Objection to Numbers.



Nashville, Tenn., is one of the few places in which automobilists have objected to the numbering of their vehicles, and on curious grounds. The proposed law does not exempt non-residents, and they fear that this would keep visitors away from the city, and that other points in the State may retaliate by requiring Nashvillians to purchase and display their numbers. It was suggested that if the ordinance be so amended as to exempt non-residents it would prove satisfactory.

Surveying an Automobile Road.

The Maine State surveyors are examining a new route for an automobile road from Poland Springs to the White Mountains. They are using a Rambler touring car furnished by E. A. Gilmore, of Boston. S. H. Baker, of the Boston office, is driving the car, having met the State surveyor and his assistants in Portland.

Testing the Pulling Power of an Automobile.

One of the most original experiments to discover or demonstrate the pulling power of an automobile was recently conducted by the experimental department of the Olds Motor Works at Detroit, and with remarkable results. The accompanying illustration will convey an idea of the performance. A 10 horsepower Oldsmobile light tonneau car was coupled to an electric street car, the trolley of which was tied down. The route of the streetcar was then followed until the car was filled with passengers, fifty-one in all. Although the weight of the streetcar was 17,200 pounds and the aggregate weight of passengers 6,885, or a little more than twelve tons weight in all, it was towed at a good rate of speed, despite the fact that these cars are equipped with very heavy motors, which are geared direct to the wheels, thus creating a large amount of extra friction to be overcome.

What Motoring in France Entails.

In more respects than one the automobile is France's "good thing." It brings in every year quite a respectable sum to the State. The tax paid in France is 60 francs a year for automobiles of two places, and 100 francs for those of four places.

Furthermore, a car doing an average distance of, say, thirty miles in Paris, and with a motor of 8 horsepower, will use 12 litres of gasolene, and in France the duty on this amounts to two cents per litre and the octroi duties to four cents. At the end of the year the consumption will be 4,320 litres of gasolene, plus 10 per cent of oil—say, 4,753 litres. The expense, therefore, will be: Customs duties, 475 francs 20; octroi duties, 750 francs 40; total, 1,225 francs, or $245.

Multiply this figure by the thousands of automobiles in use, and some idea may be obtained of the amount which flows yearly into the funds of the State.

What the Indian Failed to Grasp.

Professor Frederick Starr, of the University of Chicago, in his study of the different races of the world, has had many curious experiences among primitive tribesmen.

To an Indian, one day, he attempted to explain the principles of the automobile. The Indian was intelligent, and Professor Starr's explanation was a model of directness and lucidity.

"Well," he said at its end, "do you think you understand all about the automobile now?"

The Indian, who had listened intently, replied: "Yes, I understand all but one thing."

"And what is that?" said Professor Starr, thinking to clear up in a word some trifling point he had overlooked.

"I don't understand," said the Indian, "what makes the automobile go without horses."

The Tour of a Novice.

One of Elizabeth's most enthusiastic motorists is Dr. Thomas N. McLean, of 1,144 East Broad street, that city, who bought a model A Cadillac and used it in his first tour through some of the New England States recently. Dr. McLean, his wife and family were away on their tour about three weeks, during which time they travelled 1,000 miles, but had not a single accident or delay.

The success of this tour is remarkable, inasmuch as Dr. McLean was a novice when he started out, although he cannot be included in that class after his notable performance. Their route led them through Newark, Jersey City, New York and along the old Boston post road as far north as Hartford County, Conn., Dr. McLean's former home. Here they spent a few days, touring in the vicinity of the town, then left for home, travelling gently and enjoying the outing at every turn.

NO TRAINS FOR BAXTER

"Have'nt Used One This Year," Says the Maine Canning Magnate—How he Travels.

One of the earliest and most enthusiastic users of the automobile in Maine was H. C. Baxter, of New Brunswick. He was the owner of a number of American and foreign cars three or four years ago, and he got plenty of service out of them, both in short drives and on long tours.

His love for touring has undergone no abatement, but at the present time he is combining business and pleasure in his use of the motor car. He relies on his 35-horsepower Peerless limousine to carry him regularly from one to the other of his widely scattered business interests.

Mr. Baxter owns a chain of canning factories scattered through New Hampshire, Maine and Eastern Canada. He spends the summer months at Walpole, N. H., concentrating his attention on three large canneries in that region. Formerly he depended on the slow and uncertain accommodation trains to carry him from one town to another, and on his horses for transportation within the towns. But this year he determined to emancipate himself from dependence on train schedules, and accordingly he drove his Peerless limousine to Walpole from Brunswick, Me., where he had been using it during the winter, and put it in commission among the foothills of the Green Mountains.

All this summer he has been making daily trips to his various factories and has found going about from place to place a source of pleasure rather than of annoyance, as it formerly was. One cannery is situated at Westminster, just across the Connecticut River from Walpole, and Mr. Baxter makes a short stop there each morning. Another of his canneries is at Windsor, thirty-five miles to the north, and Mr. Baxter makes this trip every Monday, Wednesday and Friday. On Tuesday, Thursday and Saturday he drives in his car to Brattleboro, twenty-two miles to the southeast, where the third cannery is located.

Frequently his wife and four children make the trips with him. Instead of eating his luncheons, as formerly, in dingy station restaurants, he is free to drive to the charming little country inns which may be found at intervals along the road. Rain never causes a break in this routine, as, with the limousine, the elements can be defied and no matter how thick the mud may be on the steep hills which have to be traversed the ample power of the engine carries him to his destination on schedule time.

Mr. Baxter declares: "The exhilaration of daily driving gives a man just the 'ginger' he needs to tackle his business duties. I haven't been on a railroad train this summer, and I have been to Boston and New York, too."

Incidentally, Mr. Baxter, who has driven automobiles since 1898, is as enthusiastic a Peerless adherent as there is in New England, and the woods are full of them in that section.

These Aldermen Were Convinced.

Prejudice born of ignorance existing in the minds of Grand Rapids (Mich.) councilmen has been partially dissipated by rides given them by local motorists. As a result they will recommend that the present ordinance be amended so as to permit a speed of ten miles an hour in the business part of the city, in place of the present limit of seven miles. As Alderman White put it:

"Our experience gained by rides in automobiles has shown us that this is not a dangerous rate, and that many of the large cars cannot run seven miles an hour unless the power is shut off occasionally, allowing the machine to run by its own momentum. The fifteen-mile rate will be permitted under the same restrictions as at present."

Hobbses Undertake 8,000-Mile Tour.

Mr. and Mrs. W. W. Hobbs, of Lincoln, Neb., left that city last week for an eight-thousand-mile automobile trip, which will include a circuit of the Pacific Coast cities. Arriving at Seattle, they will spend some time about Puget Sound, thence proceeding to Portland and on down the coast by rail to San Francisco. Returning, Mr. and Mrs. Hobbs will pass through the extreme southern portion of the United States, New Mexico, Arizona and Texas. They will visit at Hot Springs, Ark. a short time, and will then come almost directly to Lincoln, through Kansas City and St. Joseph.

Houston Elects Lady Secretary.

Officers and directors were elected last week by the Houston (Tex.) Automobile Club at a meeting to complete the permanent organization. The following were selected: President, G. J. Palmer; vice-president, Spencer Hutchins; secretary, Miss Bering; treasurer, Dr. M. J. Lossing; directors, Theodore Bering, W. A. Burkett, Harry Dooley, Dr. W. R. Eckhardt, Charles A. Myers, D. Peacock and Dr. W. M. Brumby.

Omaha Party Starts for New York.

Frank C. McGinn and wife and Creighton Lorgy and Edward McIntyre, Mr. McGinn's brother-in-law and cousin, respectively, started from Omaha, Neb., last week on an automobile trip to New York City and return via St. Louis. They are travelling in a Winton car, and expect to be on the World's Fair ground by Nebraska day, October 25.

Glidden Gets Letter from India.

"Charles J. Glidden, Esq., touring the world by automobile motor, care Postmaster General, America," is the address on a letter containing the postmarks of a city in India received last week at Washington by Postmaster General Payne. The Postmaster General will forward the letter.

TAX ASSESSORS WERE WARY

When Automobiles Averaged but $370 Each They Boosted Values Throughout the State.

Minnesota automobile owners will hereafter pay higher taxes, in consequence of a general increase in valuations which has just been made. The increase varies from 25 to 150 per cent, and appears to have been made almost at haphazard.

According to the county returns, the number of automobiles has increased 75 per cent in Minnesota within one year. There were 399 of them a year ago, and there are 696 in 1904. Ramsey County is said to have 94 automobiles and Hennepin County 374.

The county assessors say that, as automobiles have become more numerous, they have individually grown in size and value. For 1903 the value of such machines was reported at $40,497, or $101.48 apiece. For 1904 the total value has risen to $257,540, and the average value to $370.

But the State board is not satisfied. It raised the minimum valuation for an automobile to $200, and it increased the average valuation throughout the State about one-third. In Ramsey County automobiles were raised 50 per cent; in Hennepin County, where reported values were higher, the machines were raised but 33 per cent. In Olmsted and Polk counties 150 per cent was added; in Lac qui Parle, Nobles, Redwood, Swift, Waseca and Yellow Medicine counties, 100 per cent; in Todd County, 66 per cent; in Dodge, Douglass and Morrison counties, 66 per cent; in Pipestone, 60 per cent; in Scott, Sibley, Steele, Traverse and Wabasha counties, 50 per cent, and in twenty-five other counties 33 per cent.

This action will augment the total assessment for the schedule by $86,000.

Western Railway Officials Grow Wise.

Light touring automobiles with all accoutrements necessary for travel over railroad tracks will be used by high officials, and possibly by the division superintendents, of the Great Northern system. General Manager Frederick E. Ward has received his car already, and tests have proved it to be a great success for inspection work.

General Manager Ward made several runs between Grand Forks, Crookston and other points in the northern part of Dakota, and found that the machine will run on steel rails as fast as comfort will allow, and that it excels by far the old "special car" manner of inspecting the roadbed and the lines. Several machines have been ordered, and it is thought that each of the division superintendents will receive one.

Census of Dayton's Vehicles.

Nearly 9,000 of the estimated 10,000 vehicles in use in Dayton, Ohio, have been licensed, and the city's coffers have been enriched to the tune of $9,000. The census reveals that there are 125 automobiles, 10 motorcycles, 4,650 bicycles, 1,700 one horse wagons, 1,445 one horse buggies, etc.

Proving the Practicability ot Motor Cars for Military Purposes.

IN AMERICA.

While not much was said of it in the newspaper reports, it transpires that in the recent army manœuvres on the Pacific Coast, the automobile that was used experimentally acquitted itself with high honors and proved its usefulness in that branch of the service.

Charles Willeford, who drove the Winton car that was employed, considers it the most trying work to which an automobile ever has been called on to perform.

"I was engaged by Colonel West, of General McArthur's staff, for a period of twenty-five days to test my automobile for army service," he says. "The first severe test given the machine was in running from San Francisco to Camp Atascadero, a distance of 283 miles. We left San Francisco on August 5 on the 5 o'clock Oakland boat, for San Jose, arriving at the Hotel Vendome for dinner. We remained at the Vendome overnight, and ran to Monterey the second day. On the third day we ran from Monterey to Paso Robles, which was practically the end of our journey. The party consisted of Colonel West, Major Dunning, Captain Weyman and Thomas Barbour, who can testify to the remarkable run made from San Francisco to Paso Robles without any mishap whatsoever.

"Upon arriving at camp, I was instructed to report to General McArthur with the machine, for a general reconnoitre of the ground to be occupied for the manœuvres. I started at 8 a. m. with General McArthur, Colonel West, Captain Wynn and Captain Hartman, and spent the day in traversing the rough wheat fields and mountains adjacent to the camp. Be it remembered that the ground used for the camp contained no roads whatever; we had to make our own roads wherever we went, through wheat stubbles three feet high, over ditches, river bottoms and over mountain sides, the grades of which were often over 30 per cent.

"I have driven automobiles for a number of years and have had a great deal of experience with the Winton touring car, and, while we encountered grades which I felt were almost impossible for an automobile to climb, yet, knowing that the entire responsibility of the test of the Winton car for use rested upon my shoulders, I determined to either break the car to pieces or prove that it was all the manufacturers claim for it. I am quite sure that any of the officers who accompanied me on this day will corroborate all the statements I have made.

"General McArthur stated to the writer, after we had finished the trip, that it would have taken him four days' tiresome riding on horseback to reconnoitre the ground covered by us in a period of six hours, and at the end of that time he was not the least bit fatigued, as he would have been had he made the trip otherwise. I remained in the camp with the machine for twenty-one days and was called upon each day to make trips over the camp, covering from 40 to 112 miles per day. During all this time, no part of the machinery of my car failed to respond, and not a minute's time was lost to the officers who were using the car.

"A record was kept by army officials of all the movements of the car, amount of fuel consumed, etc., etc., all of which will be forwarded to the department at Washington. From the performances of this machine, I am positive that the automobile will, in the near future, be a part of the equipment of every brigade in the United States Army; in fact, I was told by one of the army officers that an automobile would be purchased for the use of every brigade commander.

"I found the United States Army officials with whom I came in contact most agreeable in every way, and very much interested, not only in the running of the machine, but also in the mechanical construction; and the ease with which the machine was operated was a great surprise to them. The twenty-five days I spent in the employ of the government were very pleasant indeed, and when the government has placed its order for a number of automobiles for army service, I will be one of the first to enlist to serve my country as chauffeur on a Winton touring car."

IN GREAT BRITAIN.

More than one hundred motor cars were employed in the British military manœuvres, together with large numbers of heavy transport wagons and motorcycles, the latter being used for carrying dispatches and scouting. Wherever used, the various motor vehicles performed their allotted tasks successfully and with a celerity that frequently excited astonishment.

The operations consisted of an invasion of Engiand from the Essex coast under the command of General French, and the protection of the country by a force under General Wynne. Every general of note was conveyed in record time, so far as military movements are concerned, on motor cars. The commander in chief, the Duke of Connaught, was conspicuous throughout the manœuvres with a 30 horsepower Napier car. General French, who conducted the invasion, directed operations from a Daimler car.

As an instance of the work of the transport corps, it may be noted that the entire supply of bread for the defending and invading armies was delivered to the troops by gasolene and steam lorries.

The absence of breakdowns was remarkable. An 8 horsepower De Dion car, in the course of ten days, ran over seven hundred miles, including trips across boggy agricultural land and rough camp field, the whole distance being completed without a single stoppage through accident or for repair or adjustment. There was no "legal limit" to observe, and the foreign military attachés were conveyed daily from headquarters in fast cars that left all other methods of transportation in the rear.

IN FRANCE AND GERMANY.

Automobiles will be used on a larger scale than usual this year in both the German and French military manœuvres. For the former country the motor car division of the Royal Railway Brigade has made all preparations for the general use of these cars in action, and has been instructing thirty infantry men in the art of driving, as the division itself is not large enough in numbers to fulfil all requirements. Fifteen of the cars have been hired for the occasion, and the firms supplying the vehicles will be placed first on the lists for the distribution of any resulting orders for cars and cycles should their makes come through the ordeal well. Several of the steam wagons belonging to the division will be requisitioned for the conveyance of supplies. Motorcycles also will play a part, chiefly in scouting and in courier work.

The French authorities are arranging to make greater use than ever of motor cars. The generals of the French army know how to appreciate at their proper value the automobiles with which they are supplied. Three of the generals are using automobiles placed at their disposal by automobilist reservists who are doing their twenty-eight days, and there is to be seen quite a number of automobiles in use by the officers.

The general officers use them to visit the cantonments of the troops under their orders, and visits that formerly occupied a whole day on horseback can now be accomplished in half a day. An army corps will frequently occupy eighteen miles of country, and often the general in chief is from fifteen to thirty miles distant from the general commanding the corps, and in order that immense modern armies may have the cohesion indispensable to success it is necessary to reduce to a minimum the time required for the establishment of direct relations between the general in chief and the army corps. The automobile lessens this difficulty by increasing the rapidity of communication. And it is with this end in view that the military authorities have followed with deep interest the progress of the automobile industry.

In France the trials of military automobiles began in 1897. In 1900 their use was prescribed by the rules, and since then a certain number of automobiles of different models are set aside for the generals' quarters of each army corps during the grand manœuvres. These vehicles are used during the marches, in the cantonments and during the battles.

The automobile may be said to be the indispensable complement of the telegraph and the telephone for the transmission of orders. Finally, during the battle the commanding general can make use of the automobile in order to transport himself rapidly to any point where his presence may be deemed necessary. This is well understood in high quarters, and the growing popularity of the automobile in the army is the proof.

CAUSE OF ENGINE KNOCKING

May be Due to Piston Working Dry—How to Avoid Breaking Pinion Teeth.

If the engine becomes overheated a knocking will in all probability be heard. This conveys the impression that the piston pin is loose in the piston or in its bearing in the connecting rod end, or that the big end brasses embracing the crank require adjustment. The knocking is actually due to the piston working dry in the cylinder, and unless an excessive supply of lubricating oil is at once given and the engine allowed to cool down there is every possibility that the piston will seize in the cylinder and score it, when an expensive renewal of piston or cylinder, or probably both, will have to be made.

Never run the engine to its utmost capacity for a longer period than is absolutely necessary, unless you wish to shorten its life considerably. When the car is on the level or running downhill, the speed desired can be obtained by judiciously advancing the spark and reducing the gas by means of the throttle valve. This at the same time gives economical running.

When pinions are keyed to the shaft the keys are made with the very greatest care, and the pinions are, besides, held on the shaft in various mechanical ways. If, however, a pinion should become unkeyed, thus running free on the shaft, it will become necessary to dismount the gear, withdraw the shaft and replace the pinion in position and fix the key in its place, taking the precaution, however, to reinforce it either by a piece of tinfoil or very thin tin corresponding exactly with it in size. In driving the key home interpose a piece of hardwood between it and the hammer.

A wrinkle to employ which prevents keys slipping or nuts coming unscrewed is to immerse them at entering in hydrochloric acid. This acid (spirit of salt) rusts the parts in contact and binds them very quickly. When a key slips and there is no space for tinfoil to be introduced this remedy can be employed effectively.

Breaking of pinion teeth is usually due to the awkwardness of the driver either from not withdrawing the clutch sufficiently when changing speed in passing from the lowest to the highest, or more frequently by changing too rapidly from the highest to the lowest. For the latter operation a good driver, having withdrawn the clutch, will wait to manœuvre his change speed lever as the car slackens speed while using the speed required. If hurried to change speed brake lightly, by which the full force of the car will be prevented from taking effect on the teeth of the spur wheels, risking breakage.

It is necessary to examine the change speed gear from time to time, and if it is seen that the teeth are broken in the slightest degree the pieces should be immediately removed from amid the mess of grease and oil with which the case is filled. If left any time these pieces will infallibly find their way between the wheels and cause other and more serious damage. If, unfortunately, you break several adjoining teeth on the same pinion, the speed, including that particular wheel, becomes useless. When such an accident occurs the first thing to do is to fish out the pieces until satisfied that the last morsel has been removed, then make the best of one's way home on another speed.

Tips on Care of Tires.

Pneumatic tires should be kept in a temperature of about 60 degrees in a dark place, and, if possible, out of a draught, and should never be exposed to the rays of the sun before they are used (the sun has not so much effect upon tires after use); if they are, they will lose their elasticity and become brittle and small cracks will appear, which will gradually grow larger. Immediately after use pneumatic tires should be cleaned from wet and mud, and cuts in the covers should be closed so as to prevent water getting in and rotting the canvas, which is the cause of many bursts.

Proper Air Pressure for Tires.

The pump for inflating the tire should always have a pressure gauge upon it, and the tires should be pumped sufficiently hard if they are to last any reasonable length of time. On light cars about fifty pounds to the square inch; on medium weight cars about seventy-five pounds to the square inch, and on heavy cars about one hundred pounds to the square inch, and racing motor car tires are frequently pumped to about 120 pounds to the square inch.

Man Power vs. Horse Power.

The usual estimate made of the amount of power a man can develop is too high. The usual estimate is one-sixth of a horsepower; taking a day's work of ten hours, a man can put out about one-ninth of a horsepower. For very short periods a strong man can develop possibly a horsepower, but for such a period as even a minute a man who can develop three-fourths of a horsepower is exceptional.

One Source of Short Circuits.

If accumulator cells are not secured against jumping around in the battery box there is a strong possibility of their short circuiting, either momentarily or continuously. This may or may not affect the sparking of the motor at once, but will shorten the life of the battery. Keep the cells well packed or in some way secured against movement.

Advantages of a Hard Tire.

The pneumatic tire causes suction, and therefore raises dust. The narrower the tread of a tire the less the dust nuisance, whether it is a solid or pneumatic tire, and the same remarks apply to side slip, so that users of pneumatic tires should keep them pumped hard.

LEARNING TO CHANGE GEARS

How the Novice May Acquire Practical Knowledge Without Any Danger.

To the novice, gear changing is a ticklish operation. He can accustom himself to it in private if he will block up the rear axle well and stably so that the tires are at least two inches from the ground level, and wedge the front wheels at front and back with substantial wedges or planks.

Start up the engine and sit at the steering wheel seat; depress the clutch pedal slightly, and gently work the speed lever to try and bring it into the first speed notch. Probably a grating noise will be heard, and you may fail to get the wheels properly in mesh. Let back the lever to its original position and try again. If the lever goes into the notch, then at once let up the clutch pedal gently, and you will notice the rear wheels will at once begin to revolve. Depress the clutch and they will stop; let it in again and they start.

Practise this, and afterward try to get in the next speed higher, first by depressing the clutch and at the same instant bring the speed lever into the next higher notch and immediately let the clutch in gently without loss of time. The rear wheels will now revolve faster, and you can then try higher speeds; then practise reducing the gear by doing everything in the same order. While on each of the gears the engine can be run fast or slow with the throttle and spark levers, as before mentioned.

The reverse can then be tried exactly in the same manner, most cars having the reverse and forward speeds actuated by means of one lever. In the exceptions to this rule there is no difficulty in following out the operations to be gone through if the levers are carefully examined and their effect noted when they are operated.

The Proper Fit of a Piston.

To give the best results a piston should be made just as close a fit for the cylinder as it can possibly be without actual binding and it consequence, seizing. Allowance must always be made for the contraction of the cylinder, which takes place upon its becoming heated; neglect of this precaution results in seizing, which is nothing more or less than the wedging of the piston in the cylinder. If, while in this condition, the crank shaft is revolved by main force the movement of the piston up and down scores the smooth sides of the cylinder, and either ruins them or leaves them in such condition that it becomes necessary to rebore and lap the cylinder.

Opinions naturally differ as to the exact amount of clearance that should be allowed. In practice it ranges all the way from one-fiftieth to one-hundredth of an inch, and the nearer it is to the latter, provided the piston still moves slowly and without unnecessary friction, the better it is, as more compression is thereby obtained.

The Odd but Usual Failing.

Jumping at conclusions and then sticking to them through thick and thin is sometimes productive of a lot of unnecessary work. The real cause of the troubles sometimes becomes difficult to find when a motorist once gets it firmly in his head that a certain part of the mechanism is causing it.

One motorist had an interesting example of this recently. The magneto plugs of his car had run over sixteen months, and, thinking it was time to change them, as they had become somewhat worn, he fitted a new pair.

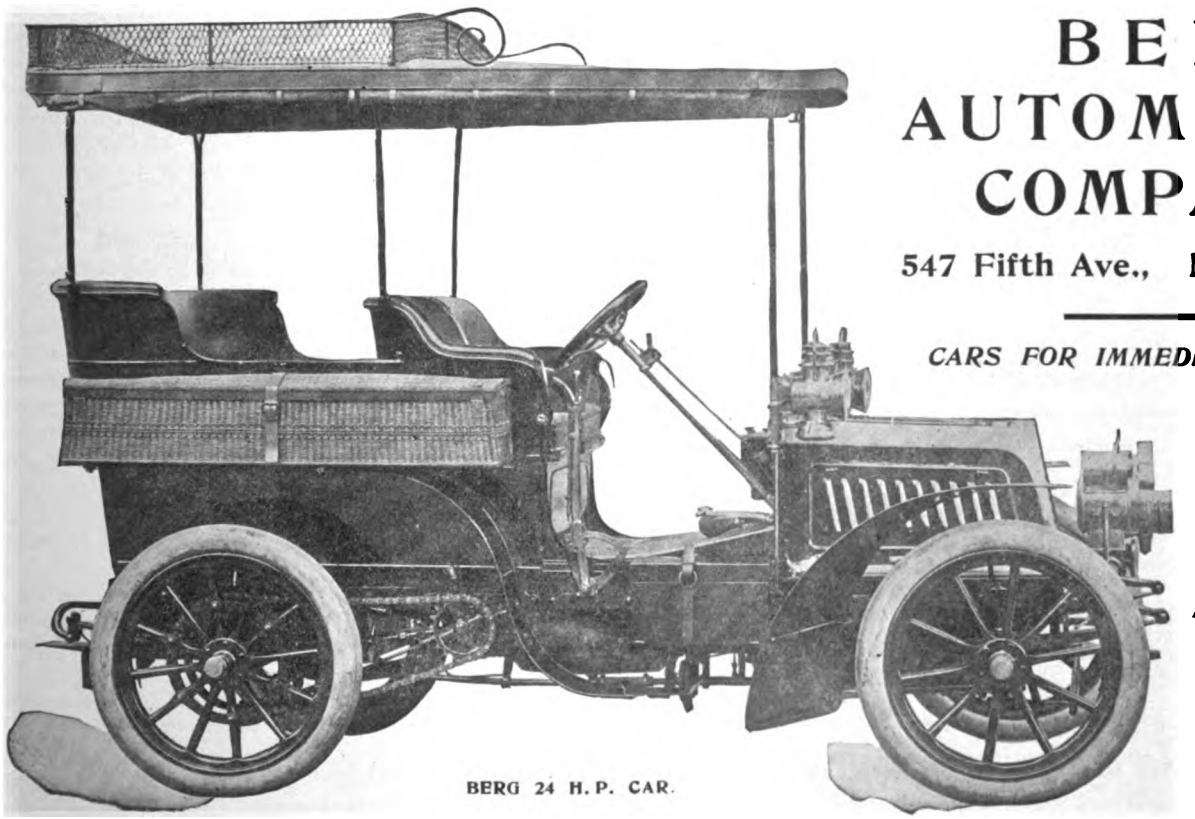
Immediately before the alteration the car had been running all right, but, when the plugs were fitted, one cylinder proved inoperative. He naturally was convinced that it was the ignition which was at fault, seeing that the failure occurred immediately after the alteration in question, and spent a considerable time trying vainly to locate the source of the trouble. He then replaced the old plugs, but the cylinder still remained inoperative, which went to show that it was not the plugs which caused the trouble.

It was only then that an examination was made of the engine generally, when it was found that one of the exhaust valves had stuck up, which, of course, prevented that particular cylinder from working.

The "Set" of the Valves.

If the exhaust and—if of the mechanically operated type—the inlet valves are not set exactly right they will give a lot of trouble. An exhaust valve that opens too soon and closes too late, or vice versa, will reduce the efficiency of the motor to a marked degree. It should open at the bottom of the piston stroke, or even a shade sooner, and close when the piston reaches its highest point. If it remains open for even the smallest space of time over the top of the stroke a portion of the incoming charge will escape, thus reducing the force of the following explosion.

As for the inlet valve, it should begin to open immediately following the closing of the exhaust, and close at the bottom of the stroke.



BEWARE OF IMITATIONS!

We advise the trade that we have been allowed a patent on our famous

BULLET LAMP

Dated July 5, 1904, Patent No. 764,396. We are informed that some unscrupulous unreliable concerns are attempting to substitute and furnish a copy of this lamp; these we are proceeding against and shall vigorously protect our patent.

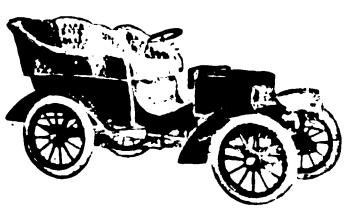
ACME DUST SHIELD.



Does not interfere with entrance to tonneau. Made to fit any car. Easily removed. Rolls up into brass shield and out of the way when not in use. Price, complete, $12.00.

THE ACME MUFFLER

for any horse power. Absolutely the most perfect muffler on the market. Correspondence solicited.

ACME MOTOR CAR & REPAIR COMPANY, Cleveland, Ohio.

A PREMIER Customer Writes as Follows:

"On a recent road trip of 40 miles in my car, one of the plugs on the end cylinder cracked and short circuited. Finding that I had forgotten my extra plugs and that I could not repair the broken one, I removed it from the cylinder head and came home, the last 12 miles on 3 cylinders, in 34 minutes, and with apparently no effort on the engine part, and the car running as smoothly as ever except with a slight loss of power and speed.

"Four cylinders are correct and economical on car, wearing parts and—last, but not least—passengers."

The **PREMIER**, the **FASTEST** air cooled car in America. The car which is saleable the year round, and which can be used the year round.

The Week's Patents.

770,611. Detachable Pneumatic Tire. Charles S. Scott, Cadiz, Ohio. Filed June 15, 1904. Serial No. 212,699. (No model.)

Claim—1. A detachable, pneumatic tire for automobiles comprising a rim flange, an annular, expansible, auxiliary rim flange extending its outer edge, and a tire shoe having a pliable semi-inextensible selvage whose stretched circumference is less than that of the outer edge of the auxiliary flange, substantially as described.

770,567. Steering Device. William H. Douglas, Belleville, N. J., assignor to Healey & Co., New York, N. Y., a corporation of New Jersey. Filed February 20, 1904. Serial No. 194,523. (No model.)

Claim—1. The combination with a conveyance having a part or parts to be turned, of an operating lever connected with the said part, a pair of screw rods mounted to revolve in unison, and nuts travelling on the said screw rods, on one of which the said operating lever is fulcrumed, the operating lever having a pivotal connection with the other nut, as set forth.

770,579. Magneto Generator. Herman Hess, Indianapolis, Ind., assignor to John A. Kurtz, Indianapolis, Ind. Filed November 10, 1903. Serial No. 180,628. (No model.)

Claim—1. In a magneto generator, the combination, with the magnets, of an armature journaled between the arms thereof, and an inclosing non-magnetic casing, surrounding said armature at its ends, said casing being cut away at its middle opposite active portions of the magnet.

2. In a magneto generator, the combination with the magnet, of the pole pieces carried thereby, the separate casing thirteen mounted between the arms thereof composed of non-magnetic material, and the armature journaled in said casing.

770,531. Pneumatic Tired Vehicle. Camille Mercader, Pittsburg, Penn. Filed November 13, 1903. Serial No. 181,069. (No model.)

Claim—1. A vehicle having supporting wheels with pneumatic tires, a pipe connecting with the tire and leading axially into the non-rotating axle and a connection between the hollow axle and the pump on the vehicle, substantially as described.

2. A pneumatic tired vehicle having a pair of wheels with pipes connected to their tires and connected axially with the non-rotating axle end and a pressure channel connecting with the two axial pipes, substantially as described.

770,559. Carburetter for Explosive Engines. Edward H. Clay, Chagrin Falls, Ohio. Filed June 26, 1903. Serial No. 163,173. (No model.)

Claim—1. In a carburetter, the combination of a casing containing a mixing chamber having an air inlet, a hydrocarbon inlet and a mixture outlet formed in line with said hydrocarbon inlet and in the opposite wall of the mixing chamber with a conical valve for said outlet, a needle valve which enters the hydrocarbon inlet and has its stem screwed through said valve, and mechanism under the control of the operator for moving said valve, substantially as described.

770,457. Automobile Coat. Robert Fox, New Rochelle, N. Y., assignor to Saks & Co., New York, N. Y., a corporation of New York. Filed April 1, 1904. Serial No. 201,136. (No model.)

Claim—1. An automobile coat, means for securing the coat together along its front, a front flap extending to the side of the coat, means for securing the flap to the coat along the side thereof, and a shoulder flap overlapping the upper edge of the said front flap.

770,458. Dress Protector. Robert Fox, New Rochelle, N. Y., assignor to Saks & Co., New York, N. Y., a corporation of New York. Filed April 27, 1904. Serial No. 205,132. (No model.)

Claim—A dress protector comprising a body and leg encircling portion and a foot covering removably secured thereto.

770,521. Speed Controller for Motor Vehicles. James L. FitzGerald, Newport, R. I. Filed January 30, 1903. Serial No. 141,140. (No model.)

Claim—1. In a speed controller for motor vehicles, the combination of a pivoted lever, pivoted arms, means on the lever engaging the arms, and a vibrating plate also engaging the arms and controlled by the aforesaid means on the lever.

2. In a speed controller for motor vehicles, a pivoted lever in combination with pivoted arms, and means consisting essentially of a vibrating plate for connecting one of said arms temporarily to the lever so that it may move in unison therewith and for simultaneously locking the other arm in a stationary position.

770,358. Cell for Storage Batteries. Pietro Figuccia, Boston, Mass., assignor of one-half to Louis M. Rossi, Boston, Mass. Filed February 19, 1904. Serial No. 194,398. (No model.)

Claim—1. In a battery cell of the class described, one or more parallel and non-conducting and parallel partitions rigidly secured in place and in contact with the cell at their upright and bottom edges, to divide the cell into a plurality of compartments, the upper end of each partition being cut down between its side edges to form a passageway for the electrolyte, a positive and negative electrode located in each compartment, the positive electrode of one compartment being electrically connected with the negative electrode of the next compartment, and a separator interposed between each pair of electrodes and supported in the compartment at its lower edge, whereby the separator may be removed or inserted without disturbance of the electrodes.

770,388. Internal Combustion Engine. David Roberts, Charles James and John W. Young, Grantham, England. Filed February 9, 1904. Serial No. 192,796. (No model.)

Claim—1. In an internal combustion engine, the combination with the cylinder having an opening substantially in line with the axis of the piston, an air inlet port located at one side of said opening and an exhaust port on the opposite side of said opening, of a vaporizing chamber communicating with said opening and valves for controlling said inlet and exhaust ports, whereby on the opening of the exhaust valve the exhaust gases and air will sweep across said opening and partially exhaust the vaporizer of its contents of burned gases, substantially as described.

770,392. Motor Vehicle Brake. Charles Schmidt, Warren, Ohio, assignor to Packard Motor Car Co., Warren Ohio, a corporation of West Virginia. Filed November 20, 1902. Serial No. 132,114. (No model.)

Claim—The combination of a vehicle axle, a brake wheel mounted on the axle, a bracket mounted on the axle, the upper end of said bracket projecting over the brake wheel, a brake band comprising two mem-

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—At Low Prices: Standard 4 Cycle Motors; Single Cylinder, 3½ H.P.; Double Cylinder 8 and 12 H. P. for Automobiles. Same with bases for launches. N. B. HARRINGTON & CO., 106 Broadway, Buffalo, N. Y.

FOR SALE—Crest Model D with tonneau, nearly new, perfect condition, brand new tires; have larger car; price, $675. Dr. C. E. COOK, New London, Iowa.

FOR SALE—Factory 50 x 80, two stories with power, machinery and tools; all lit with electricity; good fire protection; lot 56 x 150; suitable for fine automobile or carriage plant; in fine town of 1,600; two railroads and one electric road; will sell for $2,500; a snap for some one; owner going south for health. Address, Box 7, Oxford, Mich.

SEND stamp to C. A. Coey & Co., 53rd and Cottage Grove, Chicago, for the largest list of second-hand machines ever issued.

1901 WINTON Phaeton; good order; new radiator, chain, gas and oil lamps; top; extra tire; $250. H. D. RAFF, Ironton, O.

OLDSMOBILE, $250—In perfect condition; new tires. Address G. H. CURTISS MFG. CO., Hammondsport, N. Y.

FOR SALE—Top for 1904 White Steamer; never used; about half price.
H. WENDELL, Leipsic, O.

FOR SALE—Two Cylinder Pope Toledo, canopy top, side baskets, cellular radiator with fan; in fine running condition; looks good as new; $1,150.00 cash here. J. A. McKIM, Indianapolis, Ind.

1904 RAMBLER, Model K—Run 750 miles; in splendid condition; engine better than new. Equipped with speed meter, odometer, search lights, baskets, extra tubes, etc. Cost, with equipment, $1,500; will sell for $1,000. E. E. DICKINSON, Essex, Conn.

TWO SNAPS—One 1904 Ford, with tonneau and double opposed motor. Large gas headlight, two side and one tail oil lamps. Artillery wheels. Tires, motor, wheels and vehicle in perfect condition; guaranteed. Sold account death of owner. First check for $575.00 takes it.
Also, one Oldsmobile, wood wheels, with leather top, apron and sole leather boot with lock in front. Nickelplated side oil lamps, tools and air pumps. In perfect running condition. Three good tires and one patched. First check for $275.00 takes it. Address, "FORD-MOBILE," P. O. Box 604, Augusta, Ga.

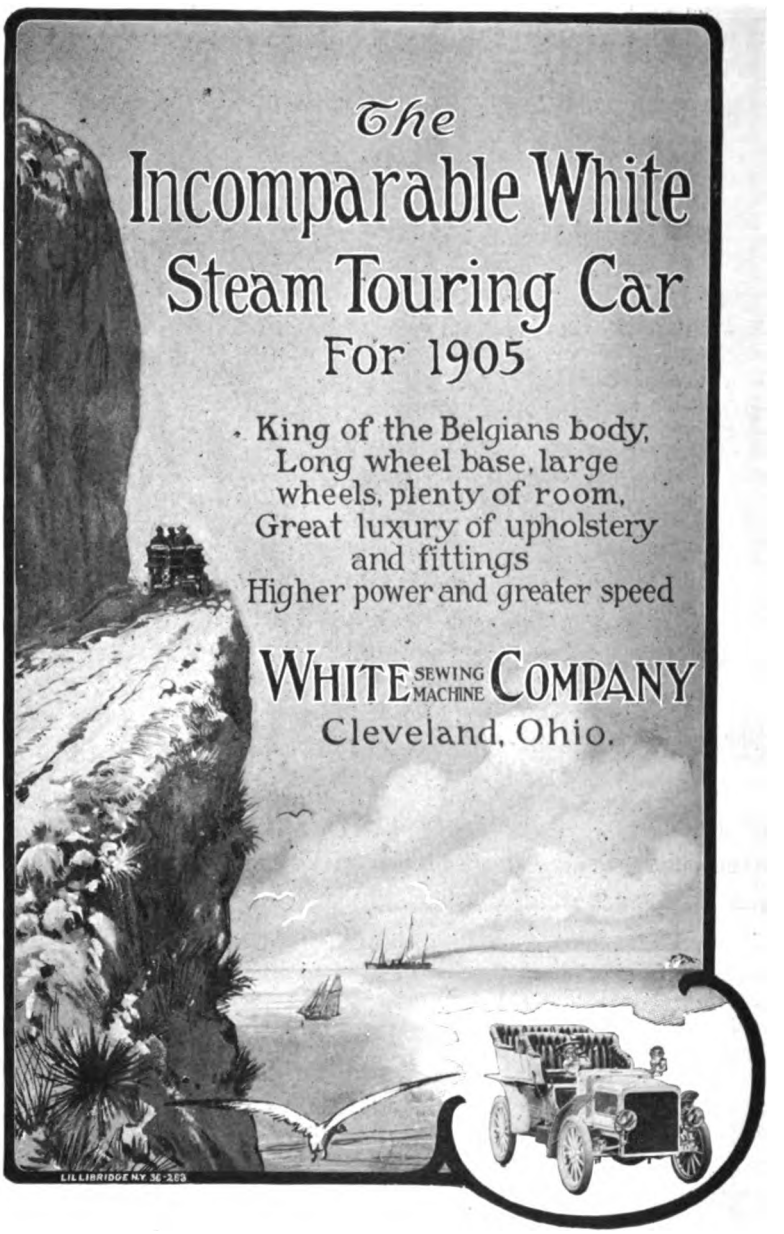
bers pivotally connected to said bracket and extending downwardly therefrom around the brake wheel, an adjustable connection between said members of the brake band below the brake wheel, a lever fulcrumed on one of the members of said brake band and connnected at one end with the adjustable connection between said members, and means for applying power to the other end of said lever.

770,727. Running Gear. Albert F. Madden, Newark, N. J., assignor to Vehicle Equipment Company, New York, N. Y., a corporation of New York. Filed January 12, 1904. Serial No. 188,684. (No model.)



Claim—1. The combination with an axle, and a vehicle body yieldingly supported thereby, of pedestals carried by the body, each having guides arranged on opposite sides of the axle, supports on the axle adjacent the guides and rollers carried by the supports, extending between the bearing against the guides to prevent displacement of the axle longitudinally of the vehicle, as set forth.

770,725. Running Gear. Albert F. Madden, Newark, N. J., assignor to Vehicle Equipment Company, New York, N. Y., a corporation of New York. Filed January 12, 1904. Serial No. 188,682. (No model.)

Claim—1. The combination with an axle and a vehicle body yieldingly supported thereby, of pedestals carried by the body, constituting guides for the axle to prevent displacement thereof longitudinally of the vehicle, and devices pivoted in the axle, between the same and the adjacent guides, to swing in a plane transverse to the vehicle, and engaging the guides to prevent sidewise displacement of the axle, as set forth.

770,348. Tire for Vehicle Wheels. Cuthbert Burnett, Durham, England. Filed August 28, 1903. Serial No. 171,158. (No model.)

Claim—In a tire for wheels the combination of the wheel rim having a transversely disposed groove in its outer surface, a tire holding ring encircling the wheel rim having a transversely disposed groove in its inner surface to register with the transversely disposed groove of the wheel rim, and a clamping member contained in the grooves having gripping members to engage the tire holding ring and prevent its creeping upon the wheel rim.

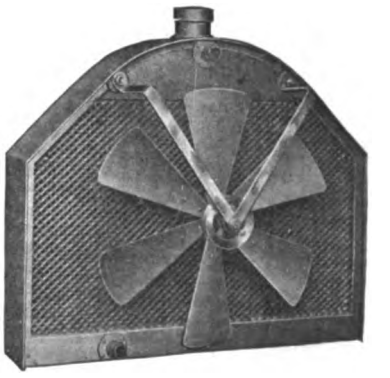
When the Motor Misses Fire.

One of the chief complaints from which engines suffer is the fault of missing fire. The cause is often very obscure and difficult to diagnose. Sometimes the trouble disappears of itself, and at other times it defies all one's efforts to remedy. A fruitful cause of irregular ignition is weakness of the battery, so when it occurs you will begin at that end of the electrical gear an satisfy yourself that all is well with the battery.

Next have a look at the other end—the plugs—and then go over the ground between. Are the contact blades rubbing firmly on the cam? Are the tremblers on the coil vibrating angrily? You will find out by opening the compression taps and turning the engine slowly. Ah! one trembler is only fluttering. You remove the contact screw and find it badly pitted. The rivet on the blade has a minute point fused on it, just opposite the part of the screw that has become pitted. A few strokes of a smooth file, a little adjustment of the contact screw, and you are rewarded with a buzz that can be heard some distance away.



It may be a high tension wire which has touched the exhaust pipe and lost its insulation, or a low tension wire which has chafed against a water pipe, or a loose terminal on the contact breaker. Sometimes the earth return wire gets broken where it is fastened to engine or frame, and then the misfiring will occur intermittently first in one cylinder and then in the other, leading you a pretty dance until you stumble over the cause.

A wipe contact should have ample means of return. The film of oil on the bearings of the second speed shaft and the other resistance between the little brass inset and the frame of the car are almost certain to interfere with a free return, so it is better to provide some other means of return, such as a wire attached to the plate on which the blades are mounted and connected to a nut on the engine or frame. A good plan is to fix a supplementary blade to rub on the centre of the fibre cam so as to make contact on the shaft on which the cam is fixed, and earth the wire from this blade.

If you are sure the ignition is all right and the missing still persists, suspect the carburetter. A partly blocked gasolene pipe will produce the symptoms, so remove the nut which connects the gasolene pipe with carburetter, and try blowing back into the tank with a tire pump. This is the rough and ready method. If it fails, disconnect the pipe altogether, and see if it is clear. The pump will clear it if you can make a joint of some sort, either by removing the valve connection or using a bit of rubber tube, or even wrapping a piece of rubber strip round and wiring it in place. The obstruction may be in the narrow orifice below the needle valve; you can find out by dismantling the carburetter. There may be a particle of dirt in the spray nozzle, which gets carried up occasionally to the tiny hole that delivers the gasolene jet, and occasionally drops back to the bottom of the passage. Clean the jet out thoroughly and wash through the passages with gasolene, when no further trouble should be experienced on the road.

WHITLOCK COOLERS

For 1905.

Experiments are Expensive.

Sometimes they are not only expensive, but fatal. This is especially true in motor car construction. It is, therefore, always on the side of safety and good judgment to adopt those parts which have stood the test of time and have acquired for themselves a reputation based upon actual merit Price is not always the most important consideration.

Therefore, in deciding what cooler you will use for 1905, select one with a reputation.

The Whitlock Cooler has stood the test of time. It has been used for two seasons by the majority of American builders of touring cars. Our experience in this line is now unequalled. Write us about your cooler proposition.

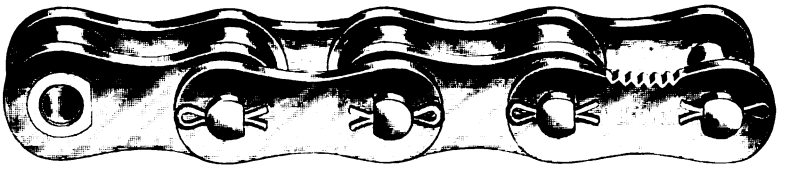
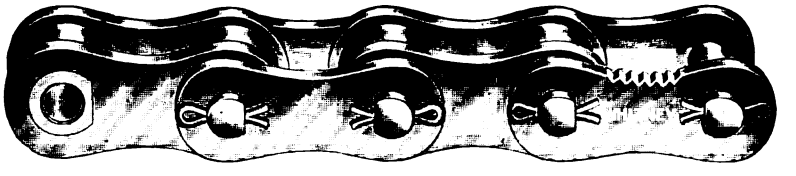
"WHITNEY" CHAINS



SUGGESTION TO AUTOMOBILE USERS.

Avoid using Cotter Pins a second time, as they are very inexpensive, and new pins are more reliable than old ones. Every time a Cotter Pin is opened and closed it is weakened and eventually it will break.



Carry an extra supply of Cotter Pins of all sizes used on your car. The cost would probably not exceed 25 cents.

The Cotter Detachable.

Patent Allowed.

REMARKABLE REPORTS from 1904 Customers.

More IMPROVEMENTS for New Season.

Oldsmobile

The Best the Field Affords

By Reason of

1—Oldsmobile motor—ripe product of over twenty years successful experience.

2—Simplicity of mechanical construction. The absence of all gaskets. Cylinders and cylinder heads cast integral. Bearings self-oiling; cam shaft gearing entirely encased.

3—Easy to start—absolute impossibility of "kicking back" in starting.

4—Style, comfort, power, plenty of speed.

5—Light Tonneau Car equipped with tilting steering post, divided front seat, honey-comb radiator, etc.

On the recent Automobile Tour—from New York to St. Louis—the Oldsmobile Tonneau Car easily held its own with cars costing from three to fifteen times as much. It maintained an average speed of twenty miles an hour over the entire trip.

Oldsmobile Standard Runabout, $650.00; Oldsmobile Touring Runabout, $750.00; Oldsmobile Light Tonneau Car, $950.00.

THE GOODRICH TIRE RECORD

IN THE

GREAT ST. LOUIS TOUR.

THE BEST YET.

79 Goodrich Tires in the run, or nearly one-third of all.

21 more Goodrich Tires than any other make.

Over 50 per cent. of the Goodrich Tires started from New York, Boston, Baltimore and Philadelphia.

Nearly 50 per cent. of our nearest competitors' tires started from Chicago only.

Not a new Goodrich Tire that showed a defect or developed a weak spot or necessitated replacement.

Two old cases which had run 12,000 and 15,000 miles respectively, were replaced a short distance out from St. Louis.

Such a record speaks volumes and gives to the

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

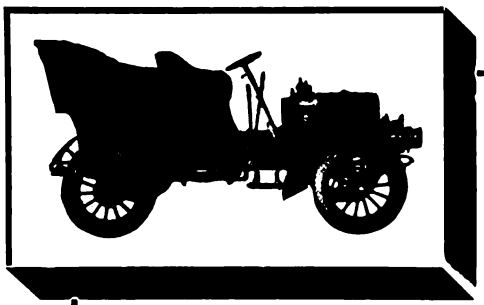
Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

Unique and Unparalleled

Performance of the Pathfinder

ELMORE



The history of automobiling in America records no more sensational performance than that of the Pathfinder Elmore on the recent trip from New York to St. Louis and return. An ordinary stock car was selected to map out the roads in advance of the endurance run. This tremendous trip of more than 5000 miles over villanous roads was made by the Pathfinder Elmore with a repair bill of only 25 cents, and not a single displacement. Did any car in the endurance run—whether it cost $1000 or $10000—equal this astonishing record of the $850 Elmore?

Send for catalogue and the intensely interesting little book "One Long Jump and Two Short Steps."

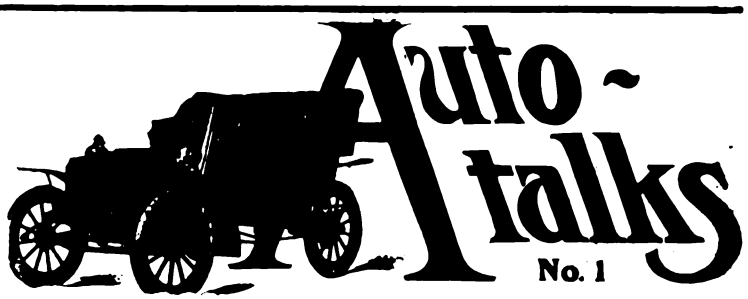
The YALE $1600

THE YALE WILL MEET THE REQUIREMENTS OF MORE PROSPECTIVE PURCHASERS THAN ANY AUTOMOBILE ON THE MARKET.

You can offer a prospective purchaser more for his money in the Yale than in any other automobile made.

You can offer and guarantee him a dergree of Efficiency, Dependability, Luxury and Simplicity of operation to be found only in other cars costing twice as much.



The Yale provides what nine out of ten automobile purchasers want. A roomy, comfortable-riding, beautiful appearing family touring car with power sufficient to overcome all road difficulties and to develop a rate of speed that will satisfy any desire to "ride fast."

Send for new catalogue and investigate the Yale at your first convenience.

THE KIRK MANUFACTURING COMPANY, 950 Oakwood Avenue, TOLEDO, OHIO.

Member Association of Licensed Automobile Manufacturers.

In this, our first "Auto-talk" to the readers of Motor World, we do not intend to discuss speed, control or any of the technicalities of automobiling.

What we do want to talk about this time is *value.*

A sensible man doesn't want to pay any more for a thing than it is worth—he wants a thing to be worth all he pays for it.

He doesn't want to pay a big price just because the maker thinks he can get that price, and he doesn't want to be told that a machine is a *good machine*, when it is really only good for the money.

Naturally he asks "Why cannot the automobile business be put upon a solid footing of *cost* and *worth?*"

It was to answer this question that we started a great automobile plant eight years ago.

And to-day we offer to the public the **Autocar**—*an automobile that is built and sold on a commercial basis*—and the only one.

The Autocar is beyond the experimental, feeling-the-way stage.

It costs what it is worth—it's worth what it costs.

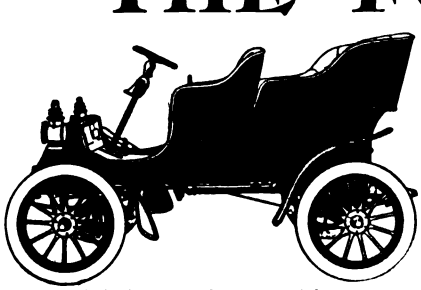
Every part from motor to minutest detail of mechanism is built upon lines that have been demonstrated by test and practice to be correct.

The Autocar has all the features of comfort, convenience and safety found in the highest priced car. Every part is instantly accessible. It is built throughout in the best manner of the best materials and finished in the finest possible style.

The Autocar has a speed of from 3 to 35 miles an hour. Extreme ease of control is attained through an unusually simple arrangement of levers.

The price of the Autocar touring car shown above is $1700—the Autocar runabout $900.

In our next month's talk we will give you more details of the Autocar's construction and performance. In the mean time we ask you to send for our booklet, in which are found addresses of our dealers throughout the country. There is one near you.



One thing is certain, you cannot afford to buy an automobile without investigating the Autocar.

THE AUTOCAR COMPANY, - Ardmore, Pa.

Member Association Licensed Automobile Manufacturers.

A good name is better than Promises.

THE FORD

has a reputation for reliability, second to no motor car in the world. For the professional or the business man who needs a machine for every day use, THE FORD stands prominent as "The Car of Satisfaction." Verified facts are better than "claims."

WINTON

Of Direct Concern to Sales Agents.

Do you sell automobiles?

Are you the representative Sales Agent in your territory?

If so, we want you to get together with us on a few logical facts in order that there may be perfect understanding before we announce our manufacturing policy, models, prices, etc., for the 1905 selling season, and before you contract for next year's cars.

We desire to take you right into our confidence, and will avail ourselves of this space to prove conclusively that your greatest opportunity for 1905 is in securing the exclusive right in your territory to sell the products of the house of WINTON.

As Sales Agent you have been—and will continue to be—an important factor in the growth and development of the automobile industry. You are so essential that the industry would not succeed without your earnest and intelligent co-operation.

We desire to be responsible for the further development of your success, and in order that we may in this manner serve you, it is absolutely necessary for us to design and produce the kind of cars sure to be demanded by your prospective purchasers who know what they want, and when they want it, and also what price is a fair one to pay.

You dare not make a mistake in your selection of cars. You must handle better cars and at more attractive prices than your competitors, if you would continue supreme in your territory.

Fully appreciating your situation in the premises, we recognize that our argument puts it right up to us to make only that kind of cars which will be most in demand by automobilists of the "advanced class." This we are going to do, and as a consequence we will expect the very best sales representation in every city and district.

During the past season we have carefully studied the tastes and desires of the most discriminating automobilists. We know just what they want for 1905. We are going to produce it in more than one model. Fact is, the Sales Agent who controls WINTON products will not need to consider much else in order to have a complete line of gasoline cars.

This limited space makes it impossible to give you a complete outline of our manufacturing policy in a single issue, but we ask that you watch our announcements during the next few weeks that you may learn of our policy in detail for the coming season. If this "continued in our next" plan is too slow, get into immediate communication with our Sales Department. The result may be mutually profitable.

In the meanwhile, and until you know just what may be expected from the house of WINTON, avoid making definite promises to any manufacturer.

On G & J Thread Fabric Tires

PEERLESS CAR, driven by BARNEY OLDFIELD,

At Pittsburg, October 1,

makes a new WORLD'S RECORD for 24 H.P. Touring Car—10 miles, 10 min. 50 1-5 sec.

PREMIER COMET, driven by CARL FISHER,

At Chicago, October 1,

makes a new WORLD'S RECORD for middle weight cars—2 miles, 2 min. 2 3-5 sec.

Why the New G & J Tire is Fast.

The fabric used in this tire is woven with very strong threads running in one direction, with very light, soft cross threads about an inch apart. In building the tire, the several layers of fabric are placed on the bias, with rubber between each and every layer. The cross threads are made as light and as soft as possible, as their whole purpose is to hold the fabric in proper position until the tire is built. These cross threads have no strength whatever. The rubber between each layer forms a cell about each of the strong threads in such a way that when the tire is completed there is not one thread touching, or in any way chafing against any other thread, and each and every thread bears its full amount of the inflation strain. Where what is termed "square woven fabric" is used, the threads in each direction being of equal strength, there must necessarily be considerable friction at each point where one thread crosses the other, and in fast driving this constant friction develops considerable heat. With our new construction, there is no heat whatever developed except what is generated from contact between the rubber surface of the tire and the road; there is no internal heat. The heating of tires has been the most serious problem in tire construction. It has been one point which tire makers have heretofore been unable to overcome. The heating of the tires causes the rubber to degenerate, and to eventually disintegrate.

Our new tire is far speedier than any tire ever before used, and the exhaustive tests which we have made have proven that the tires are more durable than any ever before used. We feel that this new construction means a long stride in the direction of reducing the trouble and expense of tire equipment to lowest possible point.

We Do Not Build Racing Machines

BUT

At Del Monte, California, on August 26th and 27th, a regular stock

Rambler

Won the 5-mile race for light touring cars in 8:16¾.

Won the Australian pursuit race for cars costing $2500 or less in 8¾ miles; time, 17:49.

Won the 5-mile race for cars costing $2500 or less, in 6:15¾.

Won the 5-mile race for cars rated at 16 horse power or less, in 6:01.

Won the hill-climbing contest for cars costing between $1000 and $2500, on a course 1⅝ miles long, with grades from 2 to 18 per cent., in 3:04.

Rambler

machines entered in eight races and received

Five First and Two Second Prizes.

SUMMARY:

Five miles, for light touring cars:

H. COUSINS,	RAMBLER,	FIRST
Cuyler Lee,	Cadillac,	Second

Time, 8:16¾.

Australian Pursuit Race, for cars costing $2,500 or less:

W. E. SAUNDERS,	RAMBLER,	FIRST
W. Grothe,	White,	Second
W. K. Cowan,	RAMBLER,	Third

Distance, 8¾ miles.
Time, 17:49.

Hill climbing contest for cars costing from $1,000 to $2,500:

W. E. SAUNDERS,	RAMBLER,	FIRST
W. K. Cowan,	RAMBLER,	Second
W. Grothe,	White,	Third

Distance, 1⅝ miles.
Grade, 2 to 18 per cent.
Time, 3:04.

Five miles, for cars costing $2,500 or less:

W. E. SAUNDERS,	RAMBLER,	FIRST
W. Grothe,	White,	Second
W. K. Cowan,	RAMBLER,	Third
E. E. Russel,	Thomas,	Fourth

Time, 6:15¾.

Five-mile race for cars not over 16 horsepower:

W. E. SAUNDERS,	RAMBLER,	FIRST
W. K. Cowan,	RAMBLER,	Second

Time, 6:01..

Hill climbing contest for cars costing from $2,000 to $4,000:

			Time.
Bert Dingley,	Pope-Toledo,	FIRST	2:43
W. E. SAUNDERS,	RAMBLER,	Second	2:47⅘
H. M. Chambers,	Great Arrow,	Third	3:25⅘
W. K. Cowan,	RAMBLER,	Fourth	3:35

Distance, 1⅝ miles.
Grade, 2 to 18 per cent.

Why not write for our illustrated motor book; it explains why the

Rambler

excels the high-price cars; it is an American machine, not a copy, and can hold its own in any company.
"Our Little History" is entertaining; it is also free for the asking.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, October 6, 1904. No. 2

FISK SUCCEEDS FISK

Reorganization Follows Acceptance of Assignee's Offer—Good Will and Prosperity Abound.

On Saturday last The Fisk Rubber Co., Chicopee, Mass., a corporation of that State, took over the Fisk Rubber Co., of the same place. Harry T. Dunn, general manager of the old company, is president of the new one, and Alfred N. Mayo, treasurer.

Mr. Mayo is the same who acted as assignee of the Fisk Rubber Co., of which he was the largest creditor. The slight change of name and the new order of things signifies that his generous offer to the creditors has been accepted, as was expected would prove the case, and that the company is again on its feet. The discharge of the assignee is practically the only formality to be observed.

The capital stock of the new corporation is $600,000, of which $300,000 is 6 per cent cumulative preferred, both as to dividends and assets in case of liquidation. Stockholders of the Fisk Rubber Co. are to receive in exchange for their shares 100 per cent par value in the preferred stock and 100 per cent par value of the common stock of the new corporation. Both the preferred and the common stock have equal voting power. All creditors to the amount of $100 or more will be paid 5 per cent in cash and 100 per cent in stock of the new company; all claims of less than $100 will be paid in cash. Fifty thousand dollars, par value, of the preferred stock is to be retired annually, or the whole or any part of it may be retired at any time at par and 6 per cent interest.

It was on October 13, 1903, almost one year ago, that the Fisk Rubber Co. made its assignment, which, strangely enough, was due directly to an excess of prosperity. It was doing too much business for its capital. It was one of those embarrassments to which it would be shameful to apply the term "failure." Everything about it was clean, apparent and above board, and practically every creditor was sympathetic and well disposed. This feeling was cemented by the liberal offer of settlement made by the assignee, the text of which is as hereinbefore given. It assures the creditors more than 100 cents on the dollar.

The new company thus starts with ample capital and a huge goodwill account, and the prosperity which smiled on its predecessor also has been inherited, and with proper bulwarks. Evidence of it is apparent to all who visit Chicopee Falls. There a big addition to the plant, a new machine shop and a new office building are all in course of erection, and so far advanced that they doubtless will be completed by November 1.

To Arrange Show Preliminaries.

In order that the members attending may be in New York at the time of the Vanderbilt Cup race, the October meeting was not held on the first Tuesday of the month, as usual, but was postponed until Friday of this week. On the same day the application blanks for spaces at the New York and Chicago shows will be sent out, and all applications must be in the hands of the show committee before October 31, on which day the allotment of spaces will be made by S. A. Miles, of the N. A. A. M.; Frank Sanger, of the Madison Square Garden Company, and General George Moore Smith, of the Automobile Club of America. A committee of the Motor and Accessory Manufacturers will be on hand at the time of the allotment to decide where the 10,000 square feet of space assigned to them will be located. The allotment of spaces for the Chicago show will be made on November 1 by S. A. Miles alone.

Not Likely to Reduce Rates.

From a chance remark let fall by a member of the railway classification committee, it does not seem probable that the efforts to obtain a reduction of the freight rates on automobiles will avail anything. The committee met with the freight committee of the N. A. A. M. at the classification committee's rooms in New York on Tuesday last, and presented their argument and request for relief. It was after this meeting that the railroad man in question let fall the remark referred to; it was distinctly unfavorable.

WILL REFUND ROYALTIES

Peculiar Situation Regarding Steering Knuckle Patent That Inspires the Refundment.

A peculiar situation has arisen in connection with one of the most interesting patents on which royalties are collected from automobile and parts manufacturers—that on the Elliott steering knuckle.

Since early in 1902 the Electric Vehicle Co. has been collecting royalties from parts makers and others on this device, and now it has been suddenly discovered that the patent monopoly on it either expired more than a year ago, or else will expire this month, which is wholly unexpected, as it was supposed that it had the renewal term yet to run.

An interesting phase of the matter is that the Electric Vehicle Co. is the one that has made the discovery, and is taking the initiative in straightening out matters. It has been collecting royalties from eighteen different concerns, and if it is determined that the patent rights on the device expired a year ago, it will take the initiative in making the proper adjustment under the circumstances.

The facts were brought to light because of rumors that reached the Electric Vehicle Co. concerning the discovery of a technicality that terminated the life of the patent having been made by a lawyer retained by one of the concerns which were being urged into line under the patent.

The patent rights on the steering knuckle in question were granted by the United States to Sterling Elliott on December 16, 1890. The application for the grant was filed on July 16, 1888. Fourteen months after the filing of the application in the United States, on September 23, 1889, an application was filed for a patent in Great Britain by Alfred G. Brookes, of London, acting under communication from Sterling Elliott here. Although the British application was filed fourteen months later than that in the United States, the British patent was issued on October 28, 1890, six weeks before the patent was issued at Washington.

The technicality comes in under Section

Digitized by Google

4,887 of the Revised Statutes of the United States, which says:

"But every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent," etc.

The law respecting the effect of foreign patents upon the life of a United States patent was changed by act of Congress on March 3, 1897, and went into effect on January 1, 1898, and provides that if an inventor makes application within the United States within seven months from the date of an application for a foreign patent on the same invention, then the expiration of the foreign patent will have no effect upon his United States patent. A further act of Congress, March 3, 1903, changed the seven months' period to twelve months. Neither of these amendments of the law has a bearing on the case, as the amendments are not retroactive. The law prior to amendment applied to the Elliott patent, and the amendments are cited merely to explain away confusion on the part of those who know the law as it is at present.

Upon hearing the rumors concerning the patent the Electric Vehicle Co., which acquired the exclusive rights to it in 1899, set its counsel to work investigating. The facts were found to be as stated. The only question still unsettled is whether the British patent expired fourteen years after the date of application for it—that is, on September 23, 1903—or does not expire until fourteen years after the date it was granted, which will be October 28, 1904. If the former is the case, the Electric Vehicle Co. will at once take the action necessary under the conditions, it being plain in such event that royalties have been collected for a year longer than they legally could be.

The Electric Vehicle Co. did not know about the British patent because it had nothing to do with the procuring of the Elliott patent, as the title of the Elliott patent is in another company and the Electric Vehicle Co. only had the exclusive rights to the United States patent for motor vehicles. The British patent was not issued to Elliott, but to Alfred George Brookes.

The Elliott steering knuckle patent is not to be confused with the Columbia steering mechanism, under the patent for which suits are now pending against foreign makers. The Elliott patent covers the double forked ends of the axle with a three-armed knuckle supported in the forked ends.

The royalty collected under the patent was $1.50 on each vehicle.

This discovery will have no effect whatever on the suit of the Electric Vehicle Co. for an accounting of royalties which is now pending against the Weston-Mott Co.

The Austin Automobile Co., Grand Rapids, Mich., will have a four-cylinder car the 1905 trade. Work on it is already nearing completion; it will have side entrances, of course.

TO TUTOR NEW YORKERS

Y. M. C. A. in Metropolis to Teach Young Ideas, and Old Ones, How to Motor.

A class for instruction in automobile engineering is to be opened at the West Side Auditorium of the Young Men's Christian Association, in Fifty-seventh street, near Broadway, New York, next week. In this the New York organization is not exactly following the lead of the Boston Y. M. C. A., for the instruction in the metropolis is to bear more directly on practical ends than the courses introduced in other cities. The New York school will invite as pupils those desirous of becoming professional chauffeurs, and also autotmobile owners who seek a thorough working knowledge of their cars.

In this move the Y. M. C. A. has the cordial support of the Automobile Club of America, with the officials of which Harrison S. Colburn, the educational director of the West Side Y. M. C. A., consulted before deciding to launch the project. Mr. Colburn consulted also with the managers of a number of West Side garages, and satisfied himself that there is a demand for competent chauffeurs who can be recommended as of good character. An employment agency for chauffeurs will be conducted in connection with the school.

There are to be three separate courses. The first is to be a series of lectures for men, either owners or prospective owners of automobiles, who wish to become generally intelligent about motor cars. It has been arranged that there is to be one of these lectures each week for a term of six months. Dr. Charles Edward Luke, director of the experimental engineering department of Columbia University, is to conduct these lectures, and will be assisted by several specialists.

Professor Amasa Trowbridge, adjunct professor of mechanical engineering at Columbia, is to be in charge of the class of designing and draughting automobiles. His classes will meet in the evening twice a week for six months.

The third class is for aspiring chauffeurs. The term for this class is three months, with both day and night sessions.

The instruction will be chiefly in the construction and operation of steam, gasolene and electric machines. The classes will be divided into groups of twelve or fifteen men each for work in the construction branch of the course, but in the instruction in operation these groups will be further subdivided into groups of only three or four. Instruction will be given for the present in the garage of the Victor Automobile Storage Co., in Fifty-fifth street, between Sixth and Seventh avenues, but the pupils will be taken to all of the principal garages in turn, where special types of machines are to be seen.

The practical indoor and outdoor work will be conducted by Clarence Bowne Brokaw.

The members of the advisory committee are Winthrop E. Scarritt, president of the Automobile Club of America; former President A. R. Shattuck, S. A. Miles, general manager of the National Association of Automobile Manufacturers; Professor Frederick R. Hutton, dean of the department of engineering of Columbia; E. T. Birdsall and Windsor T. White, president of the N. A. A. M.

Smith Gets Stamping Works.

Although before the deal was concluded a number of prints had the A. O. Smith Co., of Milwaukee, in possession of the Federal Mfg. Co.'s Smith stamping works at that point, it was not until September 14 that the transfer of the property was formally concluded. It is therefore now entirely separate and distinct from the Federal interests, and is being operated by the Smith Co., of which the officers are: A. O. Smith, president; C. G. Forster, vice-president, and C. F. Hase, secretary-treasurer.

The Smith factory, as is well known, is the largest automobile parts making establishment in the country. It is peculiarly well equipped and adapted for its work. The products of the factory are as follows: Standard and special pressed steel frames, complete rear axles with chain and bevel gear drive, complete front axles, tubular and forged; malleable and pressed steel hubs, wheel and lever steering gears, cone clutches, change gears, connecting rods, machined forgings, steel rims, steering wheels, spark and throttle levers and brake parts.

Guarantee Covers Fire and Evaporation.

The Van Husan & Parr Co., Detroit, Mich., who are marketing the Snell hydraulic system of gasolene storage, accompany their claims with a guarantee that is out of the usual. The warranty provides against fire or explosion by lightning, electric current or other fire, against sediment or water, against sputtering or spilling of oil, and against evaporation, 'whether left one day or ten years." An always visible gauge with which the device is equipped also measures not only the exact quantity, but the exact gravity of the gasolene. It is even claimed that results prove a saving of from 3 to 10 cents a gallon.

New Concern in Elmira.

The Chemung Automobile Co., Elmira, N. Y., is being incorporated this week by Charles Ufford, Clarence Sayles and Fred Rees, to do a sales, repair, rental and storage business in that city. The agencies for the Winton, Columbia, Pierce, Peerless and Oldsmobile already have been obtained, thus assuring an auspicious beginning. Ground will be broken next week for its new building, at Church and Baldwin streets. Mr. Sayles will be the active manager of the concern.

Victor Scruggs has began the erection at Green Bay, Wis., of an automobile salesroom and garage. The building will be 120x35 feet.

Digitized by Google

IN THE KALEIDOSCOPE

Trade and Personal Changes Being Made by Men and Concerns.

Walter O. Adams, formerly treasurer and manager of the Crest Mfg. Co., Cambridgeport, Mass., has gone with the Ford Motor Co. as assistant to James E. Couzens.

Norman W. Church, the well-known Los Angeles (Cal.) dealer, is now in the East renewing old accounts and taking on some new ones.

H. T. Dunn, the new president of The Fisk Rubber Co., left last week for the Pacific Coast, a business visit that he makes annually.

Fred Tone, formerly of the Rambler staff and later with the Jonas Automobile Co., of Milwaukee, will shortly assume the duties of sales manager of the Marion Motor Car Co., of Indianapolis.

The Packard Motor Car Co. are to open a Detroit branch store about November 1. It will be in charge of J. H. Brady, long one of William E. Metzger's brightest and best-liked assistants.

That Ray Owen, of New York, is to be sales manager of the Reo Motor Co., R. E. Olds's new company, is now stated as an accomplished fact. Reports to this effect have been current for several weeks.

C. W. Shanks, sales manager of the Winton Motor Carriage Co., left on Tuesday night for a five or six weeks' business trip to the Pacific Coast. He will visit not only San Francisco but Los Angeles, Denver, Omaha, etc.

F. E. Castle, of Gray & Davis, who recently took up residence in Detroit and who is making that city his headquarters, was burned out of house and home on Sunday last. Castle says it was the only illumination he has seen recently that compares favorably with that given by a Gray & Davis lamp.

Realizing finally the Scriptural injunction that it is not well for man to live alone, Mr. James Joyce, the former superintendent and present sales manager of the Electric Vehicle Co., last week took unto himself a partner. The happy event occurred at the Heublein, Hartford, Conn., and the present Mrs. Joyce was Mrs. Annie M. Strickland.

Now the "Reo" and Building Fast.

After a brief existence the R. E. Olds Co., the $1,000,000 Lansing, Mich., automobile company organized some weeks ago, has passed away. In its place appears the "Reo Car Co.," the name of which is a neat play on the initials of Ransom E. Olds, the founder and leading spirit of the concern. The change is, of course, one of name only and was made to avoid possible confusion with the name "Oldsmobile" or "Olds Motor Works," with both of which the name of R. E. Olds was so long associated.

The new company is making amazing progress. Although ground was broken for its immense plant at Lansing, Mich., but three weeks ago, the first story is already up and the window framing in place.

Ripper Disappears; Creditors Mourn.

Creditors of Victor E. Ripper, of the Ripper Motor Carriage Co., of Buffalo, N. Y., are mourning his absence and endeavoring to locate him. He departed from Buffalo suddenly about ten days ago "for parts unknown," leaving his affairs in a very much muddled condition. His creditors go so far as to assert that, in addition to obtaining goods under false pretences, he forged notes.

Ripper, who operated four stores in Buffalo, added the sale of automobiles to his bicycle business last spring. It is claimed that he bought goods extensively on credit and then sold them at cut prices and made away with the money. His list of creditors includes two banks, many local business houses and several professional men, and the total liabilities will exceed $50,000.

Morse Starts with Big Money.

A company of unusual strength has been formed at Springfield, Mass., under the title of the Morse Automobile Co., to manufacture automobiles. Articles of incorporation have been filed, the authorized capital being $250,000. Of this amount $155,000 has been subscribed. Sewell Morse, of Detroit, Mich., is the president, the other officers being: Vice-president, F. H. Young; treasurer, J. Frank Drake; clerk, A. E. Snow. Other incorporators are Edward H. Cullen, Charles L. Hoyt, J. Douglas Law and Clinton Gowdy, all of Springfield.

The concern will manufacture on a large scale automobiles built under patents owned by President Morse.

What McClintock will Manufacture.

D. L. McClintock, of Fort Wayne, Ind., is the leading spirit in the McClintock Engine & Automobile Co. of Kansas City, the incorporation of which, with $375,000, is noted elsewhere. The concern is looking for a site to build, and expect to start work at once. A car invented by McClintock will be made. Its salient feature is described as "an adjustment by which the propelling power can be attached to either the front or rear axle." The company also proposes to turn out "non-exhaust steam and gasolene machines."

Du Cros Here to Sell Panhards.

George Du Cros, one of the big men of the English Dunlop Tire Co., who has contracted for one-half of the Panhard output, arrived in New York on the Campania on Saturday last. He is fully authorized by both the parent and American Panhard houses to appoint agents and make sales in this country, which is the mission of his visit.

Winton Delays Announcement.

The Winton models and prices for 1905, regarding which some little curiosity exists, will not be announced until November 1. It is trade gossip that they will incorporate at least one big surprise.

THE WEEK'S INCORPORATIONS

Unusual Number of New Companies "Take Out Their Papers" and Prepare for Business.

Chicago, Ill.—Chicago Automobile Mfg. Co., under Illinois laws, with $50,000 capital, to manufacture vehicles and boats. Incorporators: M. F. Moss, M. E. Mogg and W. A. Whirlwall.

Kansas City, Mo.—McClintock Automobile and Engine Co., under Missouri laws, with $375,000 capital. Directors: D. L. McClintock, of Fort Wayne, Ind.; Hiram Landrus, Edwin Bond and Fred. J. Close.

Chicopee, Mass.—The Fisk Rubber Co., city of Chicopee and city of Chicago, under Massachusetts laws, with $600,000 capital. Officers: President, Harry T. Dunn, Springfield; treasurer, Alfred N. Mayo, Springfield.

Springfield, Mass.—Rogers Automobile Co., under Massachusetts laws, to manufacture automobiles. Incorporators: W. H. Rogers, J. P. Hilliard, E. G. Hubbell, W. H. Sherman, C. M. Woodward and Lewis F. Ivers.

Bristol, Conn.—The Law Automobile Corporation, under Connecticut laws, with $50,000 capital, to manufacture automobiles. Incorporators: Fred. A. Law, of Hartford, and Frederick N. Manross and Epaphroditus Peck, of Bristol.

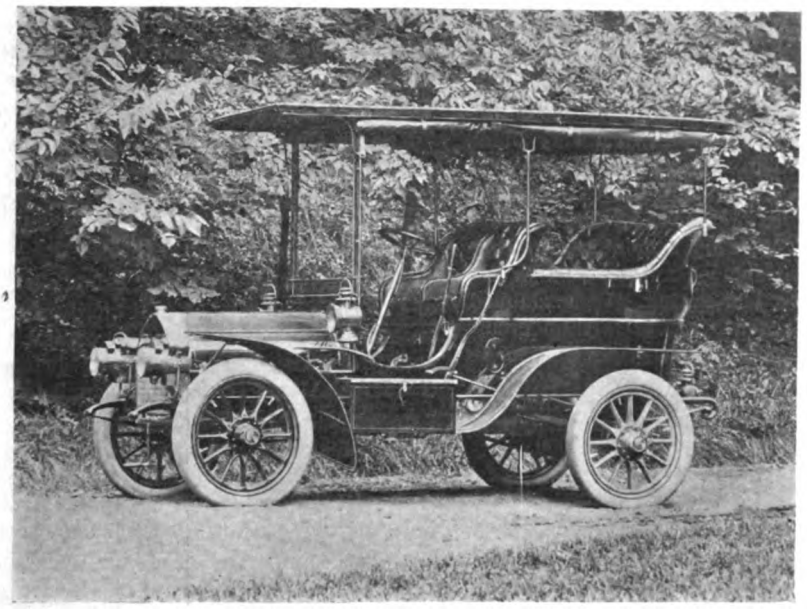
New York, N. Y.—The American Non-Metallic Storage Battery Co., under New York laws, with $25,000 capital; to store and charge automobiles and deal in batteries. Incorporators: G. K. Hartung, C. F. Schub and G. J. Wohttmann, all of New York City.

Springfield, Mass.—Morse Automobile Co., under Massachusetts laws, with $250,000 capital. Incorporators: Sewall Morse, of Detroit, Mich.; F. H. Young, J. F. Drake, A. E. Snow, E. H. Cullen, C. L. Hoyt, J. D. Law and Clinton Gowdy, all of Springfield.

Portland, Ore.—Oregon Automobile Despatch Co., under Oregon laws, with $30,000 capital, to transport freight and passengers, deal in automobiles, etc. Incorporators: H. W. Goddard, C. A. Bell and A. C. McIntosh.

Minneapolis, Minn.—The Minneapolis Automobile Co., under Minnesota laws, with $10,000 capital, to do a retail and wholesale automobile business. Incorporators: E. G. Timme, L. S. French and A. E. Paegel.

Slight Shrinkage of Exports.



For the first time in many months, the exports of automobiles and parts show a loss. It is a very slight one, however, and the figures themselves are quite up to the average of previous months, being $168,303 for August, 1904, as against $171,132 for the same month of 1903. For the eight months of the fiscal year ending with August, the figures are $1,322,499, as compared with $1,049,311 for the same period a year ago.

G & J to Open in Detroit.

The G. & J. Tire Co. are making ready to establish a branch in Detroit.

The Test That Tells.

Nowhere has it been more conclusively demonstrated that a business cannot be prosperous or even successful unless the goods it turns out are satisfactory than in the automobile industry. Looking down the long line of failures, the almost invariable cause has been the impracticality or unreliability of the car produced. It did not give satisfaction. The user into whose hands it fell paid good money for a car that was inefficient and imperfect. It might possess the elements of success, but if so it was in a crude form, and further experimentation and work were required to bring it to the stage where it could be properly marketed.

It is pretty safe to say that no concern was wound up solely because of lack of capital. That may have been the most obvious cause of withdrawal, but back of it, and overshadowing it, was some fatal defect in the car itself. It frequently happened that the money gave out before the car was perfected, but it had been brought to such a promising stage that fresh capital was subscribed and the work prosecuted with renewed vigor. Then one of two things happened—either the car became a success and still lives, or—a more frequent occurrence—the money was spent and the car still stood on the brink of success, in which case the choice was presented of obtaining more capital or quitting the field.

There are cars to-day that are successful because they give satisfaction to their users. There are others that fall short of this, and which, on that score alone, cannot truly be termed successful. The latter are the ones that hang in the scale; they must be made to give satisfaction or they will be weighed and found wanting.

By this time both trade and public understand pretty well that the most costly car is the one that gives the most trouble. First cost is really a small item. It is overshadowed by maintenance cost, and neither maker, dealer or user can afford to overlook the fact. These three widely differing and sometimes antagonistic classes have one interest in common—the production, the sale or the use of cars that will give the best service with the least trouble. The ones which get closest to this will be the ones to survive and to achieve the greatest success.

Conservatism; the Why and the How.

What every manufacturer desires is that his car shall give the maximum of efficiency with the minimum of trouble.

How to secure this condition of affairs is a task the herculean character of which is only too well understood by those who have grappled with it. Conservatism becomes a creed with most makers, because they know by bitter experience that every constructional change made in their cars means trouble at first. It makes no difference how well designed or made the part may be, or to what lengthy tests it has been put on experimental cars; the instant it finds a place on the regular models it begins to go wrong. It is, of course, only a question of a short time when the cause of the trouble will be discovered and a remedy applied; but no amount of foresight seems to avail to enable the maker to apply the much needed ounce of prevention.

This reluctance to make a change in any part that has been long used and is giving entire satisfaction is well illustrated by a recent happening. The maker of a certain device was for a long time unable to obtain a hearing from a manufacturer whom he desired to interest in his goods. After a considerable delay he did prevail upon the manufacturer to listen to him. But no amount of assertion regarding the alleged superiority of the article in question had any weight with the maker. The article he was using gave pretty fair satisfaction, and there was no reason why it should be discarded. Of course, he was always on the lookout for something better; but he had been fooled so many times, had tried so many devices that in practice failed utterly to bear out the claims made on their behalf, that he had made up his mind not to touch anything unless it could be demonstrated to him that it was a superior and practical article.

Finding that the land lay in this direction the would-be seller tried a new tack. Demonstration was just his line, he declared, and nothing would give him more pleasure than to prove the superiority of his device. He prevailed on the maker to permit a trial to be made, and was able to show that it was markedly superior to the device used on the maker's cars. The maker was surprised. He frankly admitted this, and said that he was much impressed by the result of the test. But he added that nothing would convince him but a year's trial on his cars. He would stick to the device he was already using, for he knew just exactly what it was doing, but he would order a hundred or so of the alleged superior devices and fit them to his cars. Then, after a year's running, he would be in a position to know exactly what to do.

The occurrence strikingly illustrates the conservatism referred to. Desirous as the maker is to improve his car either in detail or in whole, he is deterred from taking steps to this end by fear of making a mistake. There are many pitfalls spread for his feet, and he has learned to be wary.

The Real Value of Registration.

The Motor World desires to confess a grievous oversight in editorially dealing with the fallacy of the numbering system last week.

It was then implied that the only earthly value of the numbered tag was in that it served as a basis for extorting an extra tax from automobilists.

As a matter of fact, its chief value, or at any rate the chief result of the system, is the continuous stream of circulars, catalogues, samples and the like that flow in on the de-

Digitized by Google

fenseless car owner. Only those who have paid good coin of the realm for the gracious "privileges" of registering their vehicles and tying on a number know the Niagaralike nature of the stream; it never ceases.

The numbering system may, therefore, be said to promote trade and the sale of postage stamps, to say nothing of the petty "graft" which the sale of the victims' names and addresses affords.

Demonstrations of Economy.

There can be no lessening of interest in such an important question as the fuel consumption of gasolene and steam cars. Rather must it be viewed with increasing attention and cut more and more figure as the use of the motor vehicle is extended and the utilitarian aspect of its various functions assumes a greater prominence.

Too little attention has hitherto been given to the matter, owing, perhaps, to the multiplicity of other and less dry features of interest to motorists. What has been done has, with the notable exception of French effort in this direction, partaken to a considerable extent of an incidental, even an accidental, nature. The two instances in which consumption tests of a sort were conducted in this country were in so-called one hundred miles "reliability contests" held several years ago on Long Island and in this State, respectively. In the former, being on a comparatively level course, the better showing was made. The palm for economy in fuel consumption was borne by a runabout with a record of just over three gallons of gasolene for the one hundred miles, while a four cylinder touring car required twelve gallons to cover the same distance. There is nothing extraordinary in these figures, and they are quite cast in the shade by the showing made in French trials; but the latter were consumption trials pure and simple, where everything was subordinated to the task of getting a vehicle through on the least possible consumption of fuel, besides being, as a rule, confined largely to heavy transport wagons, many of which made use of heavy fuels. The marvellous nature of the performances thus accomplished is best indicated by alluding to the premier showing—that of a four and one-half ton wagon, which came through with a gasolene consumption of 0.0489 litre per ton weight and kilometre distance. Midway between this and the Long Island performance referred to is the work of a 10 horsepower British car in one of the British hundred miles non-stop trials, viz., one hundred miles on a consumption of only 1.68 gallons of gasolene.

Both of these performances, however, were special in character and made for the sole purpose of recording a remarkable fuel consumption. A performance much more to the point was accomplished in the British light car trials, which took place last month. An account of the fuel consumption of the cars was kept, and it possesses its value from the fact that fuel and economy was a subsidiary object; the chief purpose was to get the car through the six days without a stop, and therefore only secondary importance could be attached to the fuel consumption.

In the table of performances one car is a long way in advance. It was a 7 horsepower Clyde, which was driven 620 miles on a consumption of thirteen gallons one pint of gasolene. This figures out at 47.2 miles on a consumption of one gallon of gasolene.

How good this performance really is is evidenced by a comparison with the work of the other cars in the contest. Second place is secured by a 7-horsepower Swift with a consumption of sixteen gallons of gasolene for the 620 miles; and from this the consumption becomes greater, until the extreme point is reached with 39 gallons 7 pints.

The work of the Clyde car stands out pre-eminently, however. It demonstrates conclusively that the item of fuel expense is almost a negligible one, where a light, two passenger car is concerned, as in this case it figures out at less than one-half a cent per mile, or less than one-quarter of a cent per passenger. As already stated, this was in a contest where fuel consumption was of minor importance, and where, therefore, the conditions closely approached those of everyday running. We thus know exactly what can be done by a car of modern design in all-around use.

Springs and Springing.

In making springs for automobiles, one of the chief difficulties encountered is the necessity for allowing for a considerable variation in the weight carried. For example, a touring car that is designed to carry five or six people will frequently be used with only two or three or four passengers, in which case—if the springing is right for the full load—the springs are too rigid, making an unyielding and uncomfortable body; whereas, if the full complement were carried the result would be just the reverse.

Mindful of this fact apparently, some makers endeavor to effect a compromise. By fitting springs with a smaller number of leaves, or by making the latter narrower or thinner, they obtain a construction that gives fairly good results when the car is not fully loaded; but, as a matter of course, they fall short of equal success when the full seating capacity is made use of. The springs of such a car are overloaded, and whenever ruts or holes or bad crossings are encountered the springs are extended to their fullest extent and the body comes down with a thump, jolting the passengers and threatening injury to the springs or other parts of the mechanism.

An observer has but to note the behavior of cars, say, in passing over car tracks or a bad street crossing to become convinced that a large number of cars—probably a majority of them—are undersprung. It is notorious that for years American cars have been criticised on this score, and with a great deal of justice. That some improvement has taken place is undeniable; but there is room for a great deal more. And while domestic cars are the most common offenders, those of foreign origin are far from being impeccable. Perhaps they do not have as many broken springs as the home product, but a very large proportion of them are, in spite of their higher cost, fitted with springs too light to properly perform the duties assigned to them. Repairmen, especially those who do general work, report that they derive a very considerable portion of their revenue from such jobs as replacing broken leaves and respringing cars.

The weakness has been long admitted by candid makers, and remedial measures have been applied; but the matter is attended with many difficulties and progress has been necessarily slow.

The banker-president of the Chicago Automobile Club is quoted as saying that if the A. A. A. refuses to deal with Oldfield as he desires him dealt with his club "won't play any more"—in other words, will withdraw from the national organization. If the banker-president was correctly quoted, it is evidence that while he may be a splendid banker he is lacking some of the virtues of the high class sportsman.

Now that one of their leaders finally has had revoked his right to use a vehicle of his choosing on the public highways of the commonwealth, will the Massachusetts automobilists arise and prove that they possess the spunk of a mouse?

Digitized by Google

GODDARD CAN'T USE ROADS

First American Citizen to Suffer Penalty in Russianized Massachusetts—Others Acquitted.

Asa Goddard, president of the Worcester (Mass.) Automobile Club, bears the unique distinction of being the first citizen of the United States to be deprived of his right to use the public highways of his State. On Friday last his license to drive an automobile on Massachusetts roads was revoked for two weeks by the Massachusetts Highway Commission. Until the ban is removed he can make use of the roads only on peril of summary arrest and punishment.

The action is one of those arising from what are locally termed the Shrewsbury cases. The town of Shrewsbury, Mass., has been conducting a crusade against the alleged speeding of automobiles, and its officials made a number of arrests under the State law. Four of these cases came up for decision before the State Highway Commission, to which body the enforcement of the law's provisions is delegated, last week. In only one of them, that of Goddard, was a penalty inflicted.

In announcing the revocation of Mr. Goddard's license, the board says: "The allegations of the complaint are proven to the satisfaction of this board, and it further appearing that said Goddard had previous to the time of said complaint been convicted twice of operating his automobile at an unlawful rate of speed."

The cases of C. L. N. Cushman, of Newton; E. F. Bell, of Beverly, and Frederick L. Ames, of North Easton, were placed on file. In these cases the board states: "The allegations in the complaint are proven to the satisfaction of the board technically; but it appearing that said Bell, Cushman and Ames had not previous to the time of said complaint been accused or convicted of operating their automobiles at an unlawful rate of speed, the cases were placed on file."

By these decisions the cases of the seven automobilists from whom the selectmen of Shrewsbury sought to have licenses taken are disposed of, the other three having been settled earlier. One of the others, L. P. Sims, of Worcester, proved that his automobile was not in Shrewsbury on the day mentioned; another, L. A. Crossett, of Abington, proved that he had sold his machine before the date of the alleged overspeeding, and G. W. F. Stevens, of Boston, proved that a mistake had been made in taking the number, and that his machine was not in Shrewsbury on August 14.

To License Cars and Baby Carriages.

The Marion (Ohio) City Council is considering the enactment of two ordinances regulating the speed of automobiles within the city limits and placing a license fee on carriages, automobiles and all conveyances. Under the latter, carriages and all conveyances owned by private citizens will require licenses costing $1 each. Baby carriages will bring 25 cents each. Drays, omnibuses and other conveyances used for deriving a revenue will require $2 licenses.

Smeared Number Leads to Legal Test.

One Massachusetts motorist has plucked up courage to fight for his constitution-given rights, and as a consequence the Supreme Court of that State will be called on to pass on the constitutionality of the automobile registration law of 1903.

The matter will come up for decision in the case of the Commonwealth vs. F. Shirley Boyd, of Cambridge, which was before the Suffolk Superior Criminal Court last week, upon which a verdict of guilty was recorded by a jury on agreed statement of facts. Mr. Boyd was fined $10 in the lower court for running his automobile, which was registered, with his numbers besmeared in such a manner that they could not be read. He appealed the lower court sentence with the intention of trying the status of automobile owners and their rights under the law, and his attorney and the prosecuting attorney submitted the case to the court on the facts to which they had agred.

Judge Holmes told the jury that was impanelled that if they believed the facts as presented they should bring in a verdict of guilty, while the defence asked that the judge instruct the jury to bring in a verdict of not guilty. This ruling being refused, Lawyer Shrigley, for the defendant, excepted, and this fact was noted. The sentence of $10 imposed in the lower court was reaffirmed, and then sentence was stayed pending the Supreme Court's decision, which will probably not be given for several months.

Californians Fix Date to Endure.

After a number of postponements, the date of the California endurance run has been selected, viz., starting October 12. The run will be approximately 500 miles, and will start from San Francisco, contestants going through to Los Angeles in four days.

The run is not limited to the members of the clubs, but is open to all automobilists. The contest will be decided upon points. Each contestant will be credited on starting at 2,500 points, and one point will be deducted for each minute penalized stop. An average speed of practically twelve miles an hour, including non-penalized stops, must not be exceeded. The average running speed may be as low as about eight miles per hour, including non-penalized stops, but must not be less than practically eight miles.

Will Climb Eagle Rock Agian.

The annual Thanksgiving Day hill-climbing contest up Eagle Rock hill will be held this year as usual. It will, as heretofore, be in charge of the Automobile Club of New Jersey, and the price classification for cars adopted last year will be adhered to. Several new events will be added to the programme.

FAIRLY SLAUGHTERING TIME

Columbia Crew Nearing Metropolis with Chicago-New York Record at their Mercy.

Again a Columbia touring car, driven by Bert Holcomb, Lawrence Duffie and Eddie Bald, is the holder of the Chicago to New York record.

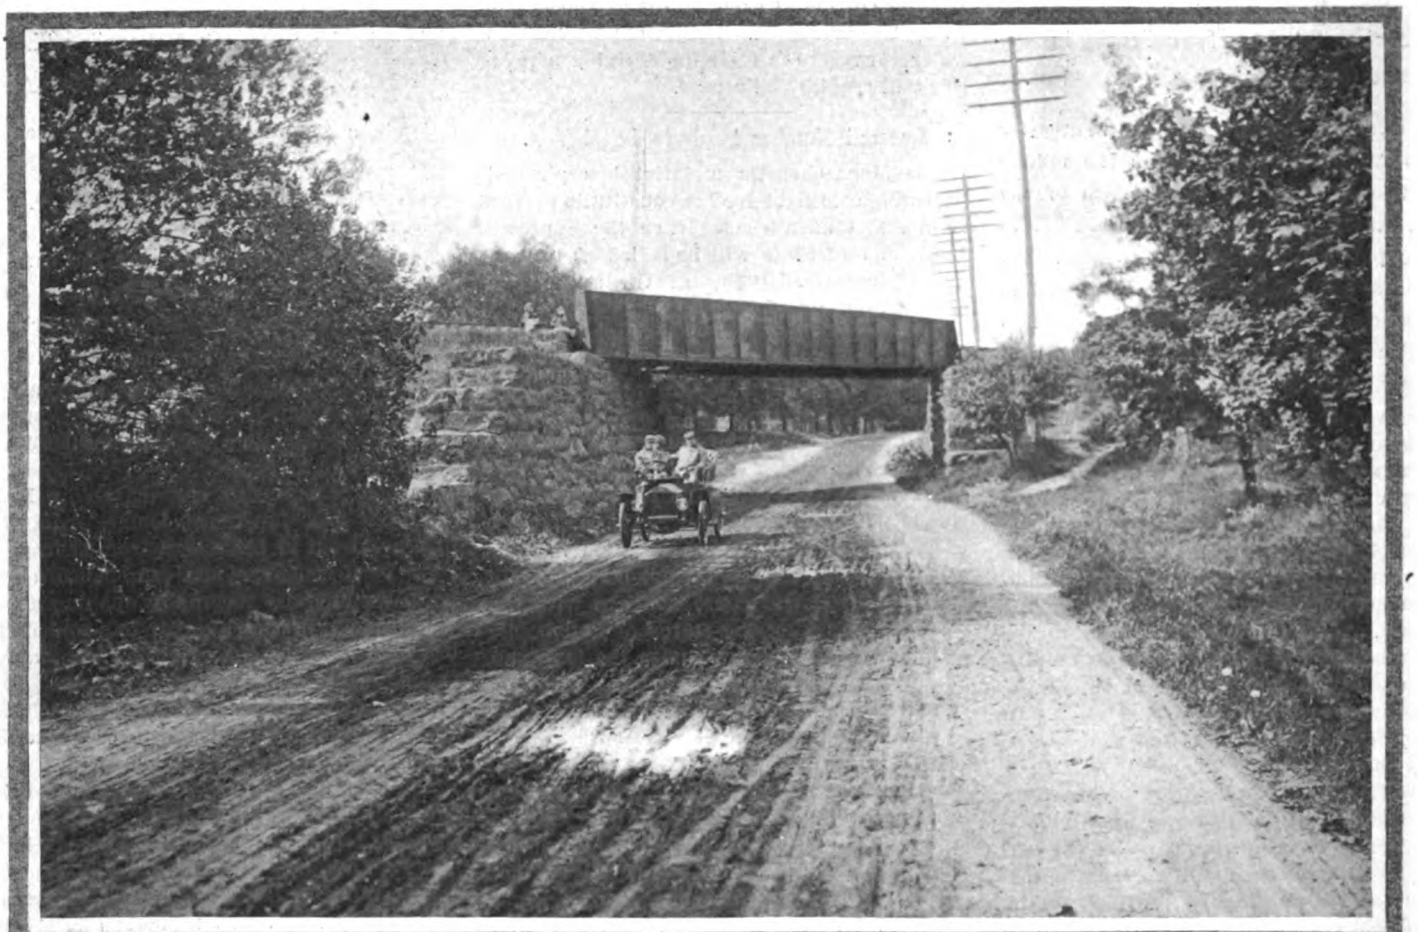
At least this apparently was the case as the Motor World was going to press. The Columbia at that time had left Newburg, N. Y., early Thursday morning for the last stage of its remarkable journey, and, barring unusual accidents, would reach New York by or before noon, with a very substantial cut in the record to its credit.

A Columbia touring car, driven by B. B. Holcomb and Lawrence Duffie, made the first great cut in the record from Chicago to New York last year, and established a new basis for intercity records by making a continuous trip, driving the car day and night, one man relieving the other and the man off resting while travelling ahead by rail. That notable performance, the first of its sort, was made with a 24-horsepower Columbia, and the time made was 76 hours.

This record of Holcomb's stood until early in September of this year, when A. G. Schmidt and J. A. Ellis drove through in 72 hours 46 minutes.

Holcomb and Lawrence set out to regain the record at 2 a. m. on Tuesday in a 30-35 Columbia, and the first 384 miles, to Cleveland, was made in 16 hours. The car beat the Schmidt and Ellis record to South Bend by more than an hour, and kept ahead of its own schedule and the record all the way. Buffalo was reached at 7:40 a. m. on Wednesday, and the car left there at 8:45. Binghampton was reached at 9 p. m. on Wednesday in a driving rainstorm.

When the car left Newburg on Thursday morning it was expected that the record would be broken by ten hours or more.



Holcomb started with the car to make the trip on Monday morning, but was obliged to turn back. Newspaper reports stated that an axle broke, but this was not true, as is obvious from the early start made on Tuesday. What happened was that the gas lamps blew out, and in the dark the car ran into the end of a blind road and bent a pivot. There was no other damage.

The Beauties of Registration.

But for the fact that he was able to produce proof that his car was in the shop at the time of the alleged occurrence, Dr. E. M. Eisenbeiss, of Indianapolis, Ind., would have been found guilty of illegal speeding. A policeman thought he saw Dr. Eisenbeiss's initials on a fast-running car, and haled him in court to answer for the offence. The case was dismised after it was shown that the Eisenbeiss car was entirely different from the offending one, and that it was not in use at the time.

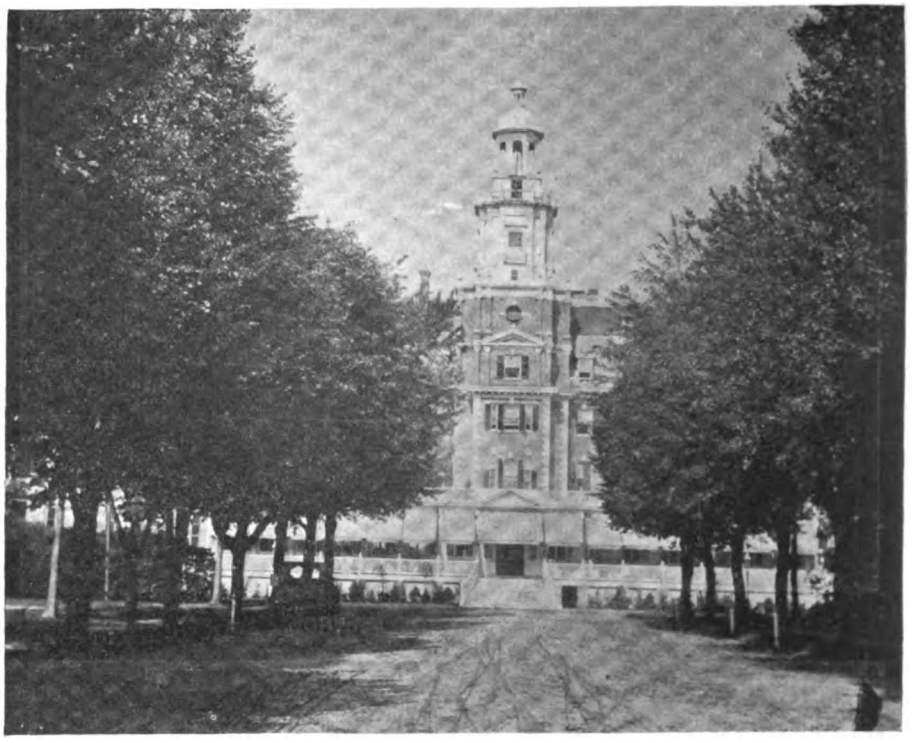
READY FOR BIG RACE

Opposition Collapses, but "Yellow" Press is Still Shrieking—The Doings of the Week and the Conditions Chronologically Stated.



America's first great road race and first truly international contest between motor cars, which is to be run on Saturday under the auspices of the American Automobile Association over a course on Long Island for the cup presented by William K. Vanderbilt, jr., has been the all absorbing theme of the last week. Not only has it been the subject uppermost in automobile circles everywhere, but the interest of the general public has been quickened until the coming event has assumed, as it should, proportions that far overshadow any previous automobile event in this country.

With the automobilists an unprecedented enthusiasm has been kindled, and this has been infectious to many of the general public, but the attention being paid to the forthcoming race has not been wholly due to friendly interest. The yellow journals have been busy inciting opposition, and so much of the public attention being given to the affair has been due to this that the enthusiasm of those who want to see America take its place among other nations in offering a field for international competition, to the end of fostering a great new industry and sport, is mixed with apprehension.

At the present writing the competition between the "yellows" in crying "Wolf" to the public and making frantic efforts to influence the minds of readers is so great that it is a fairly open question whether or not the race will be run without at least some serious interference and perhaps delay. The opposition of a few farmers, banded as a "protective association," has been overcome and their antagonism changed to indorsement, but the notoriety seeking "yellows" have declined to accept this verdict, and are continuing an individual clamor against the race. One New York evening daily has gone so far as to declare in flaunting headlines that, although the people most concerned are in favor of the race being run, it will prevent the contest.

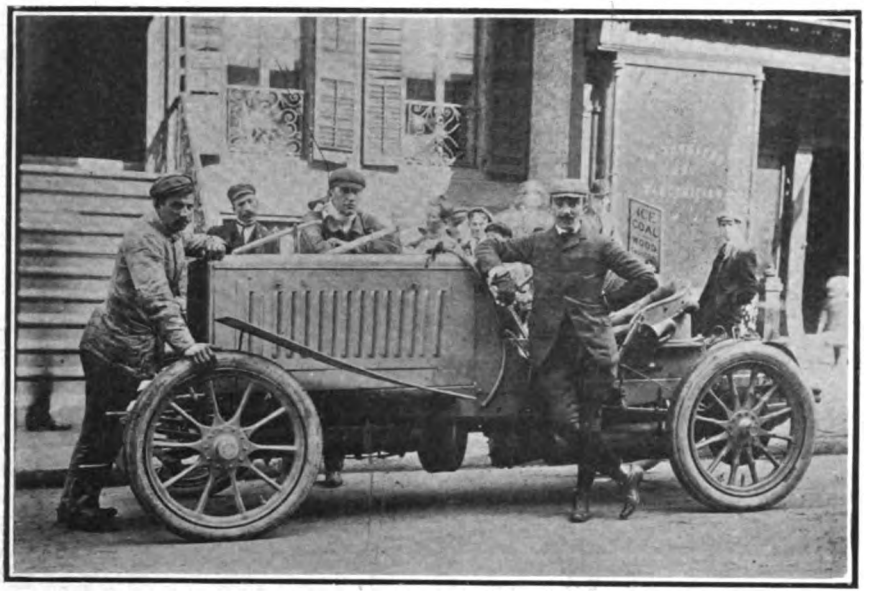
The obvious inference is that an insurmountable barrier, or a serious delay, may be imposed at the last moment by the suing out of an injunction by the opponents of the race, just as it was pointed out last week by the Motor World exclusively might be done. The apprehension of this was expressed by Chairman A. R. Pardington of the A. A. A. racing board in the interview with him published by the Motor World last week. Mr. Pardington's comment on the situation, which was then not so critical as it is now, was as follows:

"Everything that human foresight can suggest has been done. We have engaged counsel and prepared affidavits for submission in case an injunction is granted, and shall at once ask that it be vacated. The only way they can give us serious trouble is to spring the injunction on us at the last minute—say the morning of the race. That would cause some delay, of course. But it is very doubtful whether they can do this. An injunction can be granted only by one of the three judges in this district, and unless some of the facts in the case are concealed when making the motion, I do not believe an injunction will be granted."

HEADQUARTERS AT GARDEN CITY.

Barring the doubt introduced by this hysterical attitude of the "yellows," the prospects for a great race have seemed excellent, albeit opinions differ concerning the quality of the course and fears of disaster have been expressed by some.

Arrangements for safeguarding as far as possible both the contestants and the public, for starting, checking and timing the race, laying the dust on the course and fixing the poor spots on it, and providing for spectators have been elaborate. The preparations have progressed rapidly, and with the exception of one fatal accident on the course that was not due to speeding nor to recklessness, all has gone smoothly and with satisfactory promise for the outcome.



The preparations, coupled with the arrival of the foreign contestants, the repairing of all the competitors and scores of visitors to the scene of the contest, the practice work on the road, the one sad mishap, the opposition of the "yellows" and the speculation as to the result have worked up a steadily increasin interest that is emphasized all the more by the apathy shown toward previous international races and during the summer toward this one. The enthusiasm did not become a flame until after the foreigners were all here, and it was demonstrated at the drawing for position that every one of the eighteen entrants intended to start, and after the exploring of the course became brisk and of daily continuance, but all this week the flame has been fed and fanned and has burned brightly.

The news incidents in connection with the

TESTE (PANHARD), FRANCE.

TART (PANHARD), FRANCE.

TRACY (ROYAL), UNITED STATES.

preliminaries for the race have been numerous enough to keep the subject prominent in the daily press, and the prospects when the first half of the week had passed were that tens of thousands of persons will throng to see the race.

Briefly summarized, the events of the week which have kept the race in focus and intensified interest in it have been: The arrival of celebrated foreigners to compete or to witness; the drawing for starting positions by the competitors; the flocking to the course of all the contestants and others interested; the opposition of local motorphobes supported by the hysterics of yellow journalism; the accident which resulted fatally to Harold Rigby, a mechanic, on Monday; the public hearing before the supervisors at Mineola on Tuesday at which the local populace voted approval of the supervisors who granted permission for the race; the sprinkling of ninety thousand gallons of oil on the

GABRIEL (PANHARD), FRANCE.

roads of the course; the completion of the grandstand, and the work of patching up the bad spots on the course.

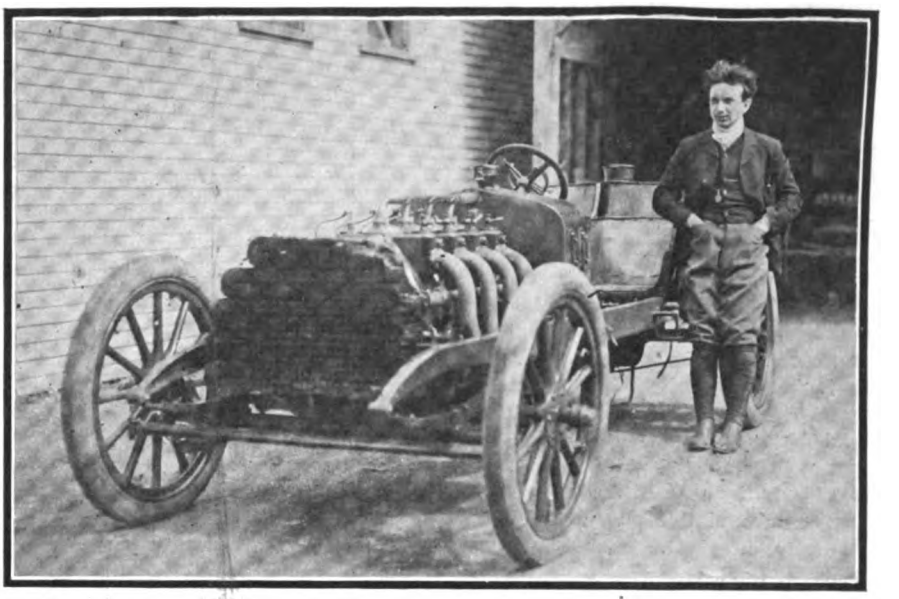
Before citing the details of the latest happenings a synoposis of the race conditions, the course and the contestants will be appropriate, even at the cost of some repetition.

The cup that is the prize for which the automobiles will compete on Saturday was presented to the American Automobile Association by William K. Vanderbilt, jr., to be a perpetual trophy for international competition by members of clubs recognized by the A. A. A. and the Automobile Club of France. Not more than ten cars may represent any one country. The first two races, those of 1904 and 1905, must be held in the United States, regardless of who is the winner, but after that the race may be held in the country of the club that holds the trophy. The commission in charge of the race this year is the racing board of the A. A. A., as follows: A. R. Pardington, Brooklyn, chairman; William K. Vanderbilt, jr., New York; James L. Breese, New York; William Wal-

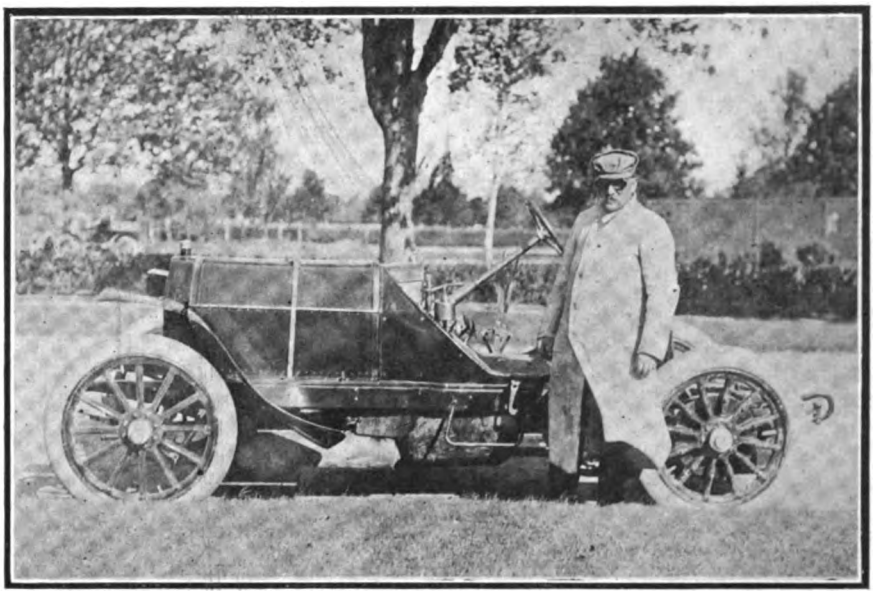
Digitized by Google

lace, Boston; F. C. Donald, Chicago, and G. L. Weiss, Cleveland.

The cars entered for the race must weigh not less than 881 pounds nor more than 2,204 pounds, and each must carry two persons, weighing not less than 132 pounds each, seated side by side. The distance of the race must be not less than 250 miles nor more than 300 miles. All these things are provided for in the deed of gift, and are supplemented by rules in detail adopted by the racing commission.

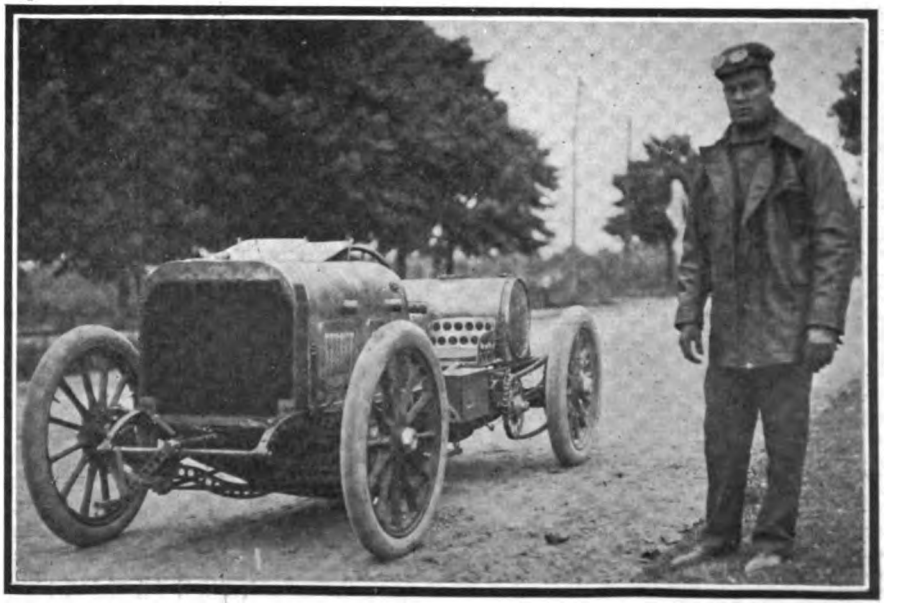


The course selected by the commission is located mostly in Nassau County, on Long Island, with just 6,557 feet of it in Queens County, and therefore within the limits of greater New York. For permission to race on this portion a special permit had to be obtained by action of the New York Board of Aldermen. For permission to race on the major portion of the course a special permit



SARTORI (FIAT), ITALY.

was obtained from the Board of Supervisors of Nassau County. Under the automobile law of 1904 the local authorities of any county were empowered to suspend the speed limit on any road in order to permit racing. Before applying to the Nassau County supervisors, however, the race commission took a petition around to the residents of the several villages and towns in the county and to the farmers, and received an overwhelming majority of the signatures of the residents. In East Williston, for instance, the signatures of every voter excepting five were obtained. It was on the strength of this petition that the Nassau County supervisors granted the permit for the race, suspending the speed limit for the benefit of those in the race for that day.



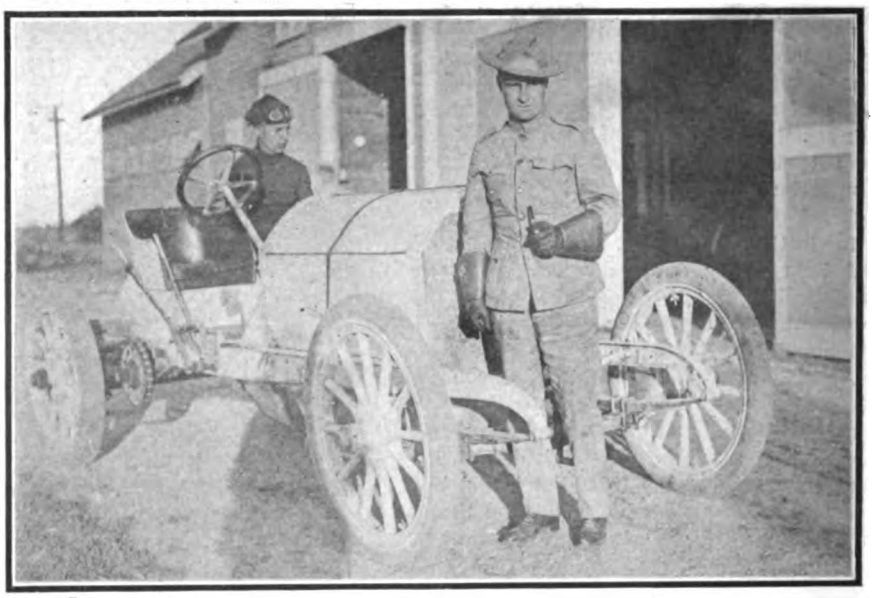
The course is an elongated triangle, or cone in shape, with the base lying to the east and the apex to the west. This apex is at Queens, fourteen miles from New York City. The start and finish will be at Westbury, about twenty-seven miles from New York.

CLEMENT (CLEMENT-BAYARD), FRANCE.

WERNER (MERCEDES), GERMANY.

CROKER (SIMPLEX), UNITED STATES.

Digitized by Google



The course passes through the villages of Jericho, Hicksville, Central Park, Hempstead, Queens, Hyde Park and Jericho, with Floral Park, Garden City, Mineola and Westbury lying within, in the infield, so to speak.

The course is exactly 30.24 miles in length, and must be covered ten times. There are two controls on the course, one at Hicksville, 0.40 of a mile in length, and one at Hempstead, 1.40 miles in length. Three minutes must be spent in going through the Hicksville control and six minutes in going through the Hempstead control. Thus the total distance of the race will be 30.24 miles, multiplied by ten and less the sum of the distances in control, 1.80 miles, or just 284.40 miles total distance.

The race will be started at Westbury, and the cars will run by way of Jericho, Hicksville, Hempstead and Queens, so that every turn will be to the right. There are sharp turns, at right angles or slightly acute, at each corner of the triangle—at Jericho, at Plain Edge, below Central Park, and at Queens. These will each have to be negotiated ten times, and all of them are apt to prove troublesome. There also are a number of other "ticklish" angles in the course that are not exactly comforting at high speed and that hold promise of "developments." A portion of the road between Plain Edge and Hempstead is being reconstructed, and may not be completed in time; if it is not, it will make rough going. On the Jericho road, near Queens, the course is none too smooth, and requires a viselike grip on the steering wheel. There are also seven or eight miles of road on the course which are so narrow that it will be risky for the contestants to attempt passing there.

The race is to be started at 6 a. m., and is expected to be finished in about five hours.

Eighteen entries were made for the race. Classified by nationalties the entrants, the cars and their drivers are as follows:

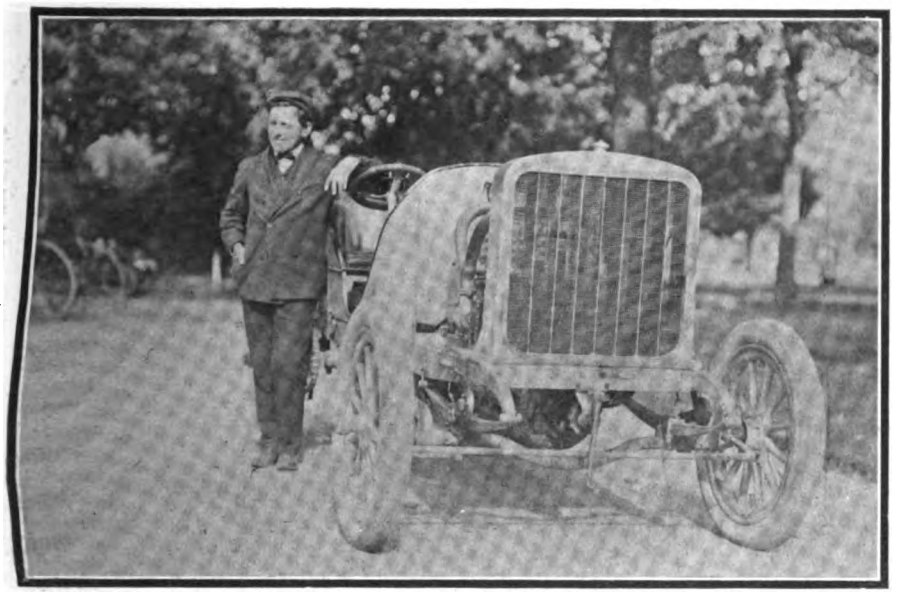
The checking and timing system to be used for the race is one of great elaboration. For the official timing the method used in the Paris-Madrid race has been adopted. Each car will carry a polished copper box attached to the seat. At the starting point the checker will drop into this box, which is locked, a ticket bearing the starting time of the car. At the entrance to each control the checker will drop a card stating the time of arrival, while the checker at the exit of each control will drop in a card stating the time of departure. At the finish the time of each car will be similarly put into the box, so that when the boxes are emptied the judges will have in hand a complete official record of the time of each car. Besides this, the time of each car will be taken every time it passes the grandstand, so that the time for each round will be known. Beyond all this again, arrangements have been made with the Federation of American Motorcyclists whereby there will be twenty checkers mounted on motorcycles distributed along the course, who will record the passage of each contestant.

Experiments with crude oil were made on the course as long ago as September 23, and, being satisfactory, the work of sprinkling the course with ninety thousand gallons of crude oil was begun a week ago last Monday, and it was continued late into the present week. Eighteen tanks of oil, holding five thousand gallons each, will be used, and the cost will be about $5,000. As was told in the Motor World of last week, a contingent fund is being subscribed to in order to defray any possible deficit in the accounts of the American Automobile Association in connection with the race.



The work of building the grandstand that was begun about two weeks ago has gone on daily, but the progress was slow owing to the plans being changed a second time in order to accommodate more persons. A bulletin board has been erected opposite the grandstand.

The first contingent from abroad to arrive were among the first contestants to visit the course, and for a brief bit they had it to themselves before enthusiasm was generally aroused. On last Friday, when young Albert Clement started with his 80 horsepower

THE CHECKING BOX.

WEBB (POPE-TOLEDO), UNITED STATES.

Clement for his first visit to the course, he had a novel adventure, in which his car narrowly escaped serious damage. While running over the Hoffman Boulevard, near Elmhurst, Clement turned his car out in order to pass a team, and in doing so ran into a mud hole, in which one of the front wheels nearly disappeared. A team of horses and ten men worked nearly an hour extricating the car. Fortunately no damage was done.

One serious hitch that threatened to reduce the field of starters occurred last week, when the Custom House authorities held up the three 90 horsepower racers of Heath, Teste and Tarte and the De Dietrich Gabriel is to drive in default of $18,000 duty. Under a special order from the Treasury Department, cars imported solely for the race were permitted to enter free, under a bond that they be reshipped within a short time. Through an oversight, however, it was neglected when the cars were shipped from France to declare the purpose they were going for, and so the duty was demanded. Through influential intercession, however, the cars were released last Saturday under a special order from Assistant Secretary Armstrong of the Treasury Department.

The real active stir which betokened the last few days of preparation for the race may be said to have begun on last Friday, when the steamer Savoie arrived with the last of the contingent of foreign competitors aboard. These were Gabriel, famous winner of the last Paris-Madrid contest, and who will drive the 90-horsepower De Dietrich in the race on Saturday; Teste, who finished second in the last Circuit Ardennes, and who will drive a Panhard on Saturday, and Tarte, who will also drive a Panhard. Besides these three famous chauffeurs, the Savoie brought M. Voigt and Count Armand de Gontaut Biron, both of the firm of Charron, Giradot & Voigt, who came on a business mission, but appointed their time so that they might see the race.

The French chauffeurs spent but little time in New York, making haste to reach the course and join their fellow competitors in the Long Island road houses. Out on the course they found young Clement, the Frenchman, and Heath, the American, both of whom came from Europe to drive in the race, besides their compatriots, Sartori and Bernin, the chauffeurs of A. G. Vanderbilt and W. G. Brokaw, respectively, who are permanently settled in America.

On Saturday the course was being oiled, but that did not prevent the entrants from exploring it, and in spite of all warnings there was some speeding.

Saturday night all interest centred on the drawing for positions at the Automobile Club of America. Every one of the eighteen drivers entered for the race excepting two and many of the owners of the cars entered were on hand for this affair.

The drawing, as conducted, was eminently fair. It was not done with regard to nationalities, as was expected, but every one drew as an individual, under a plan that gave no nation and no person any preference, but put all on an equal basis. First a lot of slips, numbered consecutively from one to eighteen, were folded and put into a box and the contestants invited to draw. This was merely a preliminary drawing in order to insure impartiality. The numbered slips thus drawn determined only the order in which the contestants were to draw for the order of starting. There was no scramble or unseemly haste about this first drawing. The competitors were all notified of the arrangements, and at their leisure they went and picked a number. In this way all possibility of any accusations of unfairness was avoided. As all the numbers, including one, would be in the hat when the first man drew, it followed that the first to draw would have a better chance of getting a low number than those who drew later, unless by unusual chance all of the early drawers got high numbers. At all events, the plan was devised for the purpose of leaving everything to chance in determining the order of start and nothing to dictation.

The preliminary drawing over, the contestants took the turns that numbers gave them in making the final drawing. The numbers determining the order of start, all securely hidden in sealed envelopes, were placed in a hat and the final drawing was made. This resulted in a distribution of luck of which no one could complain, and which, on the whole, was pretty fair. Four countries—America, France, Germany and Italy—being represented in the race, the first division would be counted as four cars, if the starting was ordered by nationalities, as it is in the Bennett Cup race. The drawing gave place in this first division to two American cars, one French machine and one of German make, Italy being the only one of the four countries not in the first division.

As determined by the drawing, the start will be as previously detailed.

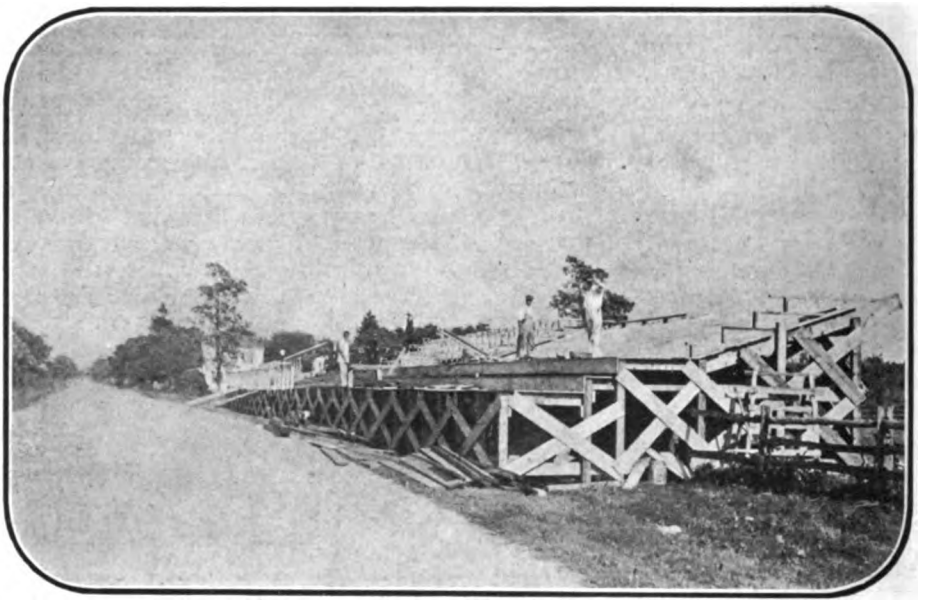
It will be seen that due respect was paid to those who might be superstitious by omitting the number 13 from the list.

It will be seen by the table that Italy had the poorest luck of any nation, albeit both of the Italian cars are owned by prominent Americans, and one is to be driven by its owner. Although the result of the race will be determined by the fastest time made, and not by the first across the tape at the finish, it is recognized that the order of the start will have much to do with its outcome. On the face of it, the German cars got the best of the drawing by getting number one. The Americans did well by getting two places in the first six. Although four French cars are back in the rear bunch, the Frenchmen are thought to have the best of the drawing. Gabriel will start second and Heath seventh. With a practically clear road ahead of him and Heath and Werner, who will start ninth, separated from him by long intervals and having a number of cars to pass, Gabriel will have a great chance. Still, the way-back men will have the pace set for them and a constant incentive to work by car after car ahead.

On Sunday last the course was a Mecca for not only devotees of automobile racing but for many pilgrims of the sport and trade besides. Hundreds of machines, touring cars as well as racers, went scooting over the course, and hundreds were on hand at the roadside to watch.

There was speeding, of course, and it was not interfered with, despite all the statements of the racing committee concerning the strictness with which the course would be guarded. The comment concerning the course was various. Gabriel and a few others pronounced it better than the course in Ireland over which the race for the Bennett Cup was held in 1903, arguing that the Long Island course is free from hills, has fewer controls and no more turns than the Irish course. Others doubted that the course would prove to be very fast, on the ground that it is small, requiring ten circuits, thus multiplying the number of bad turns, and on

Digitized by Google

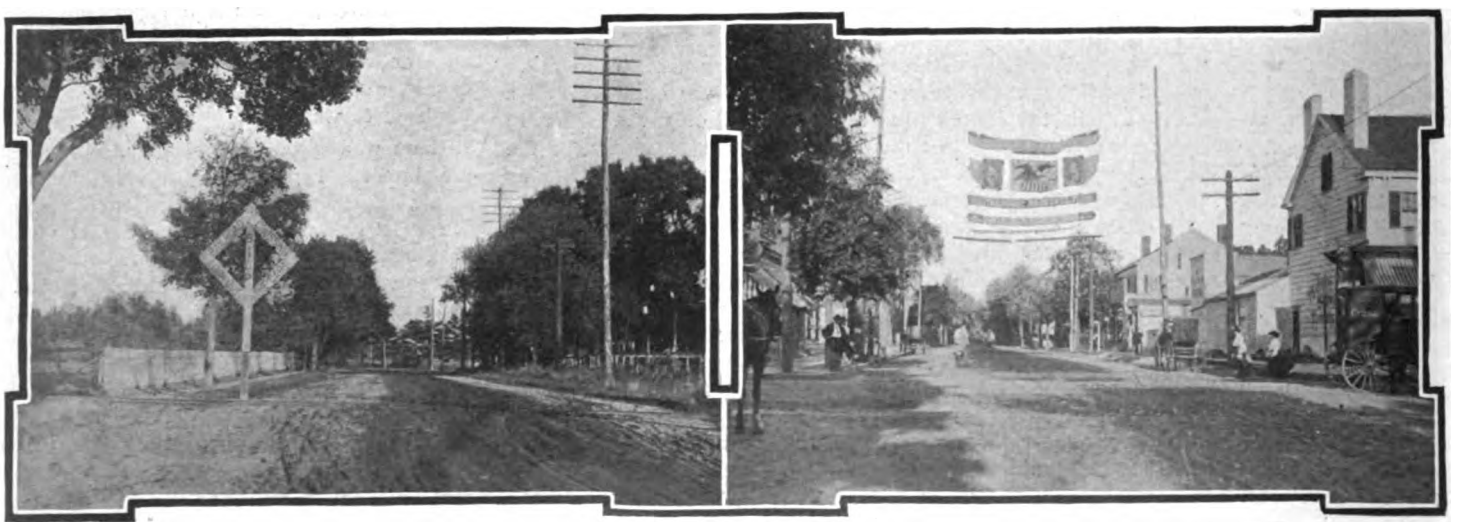


Sunday had places where the surface was very poor, and which it seemed impossible to remedy in time for the race.

The Motor World man who attended the Bennett Cup race in Ireland, and saw the course there, after looking over the Long Island course disagreed with Gabriel. He thought that the course here will not prove so fast nor so safe as that in Ireland. The compound turn and curves at Jericho he deemed dangerous, while the turn at Plain Edge to the Bethpage Pike is one that the racers are apt to run past. The bad stretch of road on the Bethpage Pike is one that is apt to be in such poor condition as to compel slowing or the taking of risks, and at the turn in Queens the road is ten inches deep in sand. The cars will each have to slow down thirty times at the Jericho, Plain Edge and Queens turns in the ten laps of the race.

The work of oiling the course was in progress on Sunday while the contestants and other visitors were going over it. An illustration of the thorough and conscientious way in which this work was being done was afforded when the driver of one of the sprinkling carts containing oil shut off his stream and pulled aside to let a visiting automobile go past, and in doing so left a small patch of road unsprinkled. To correct this the driver of the sprinkler backed his team after the motor car had passed and carefully sprinkled the small spot thus neglected.

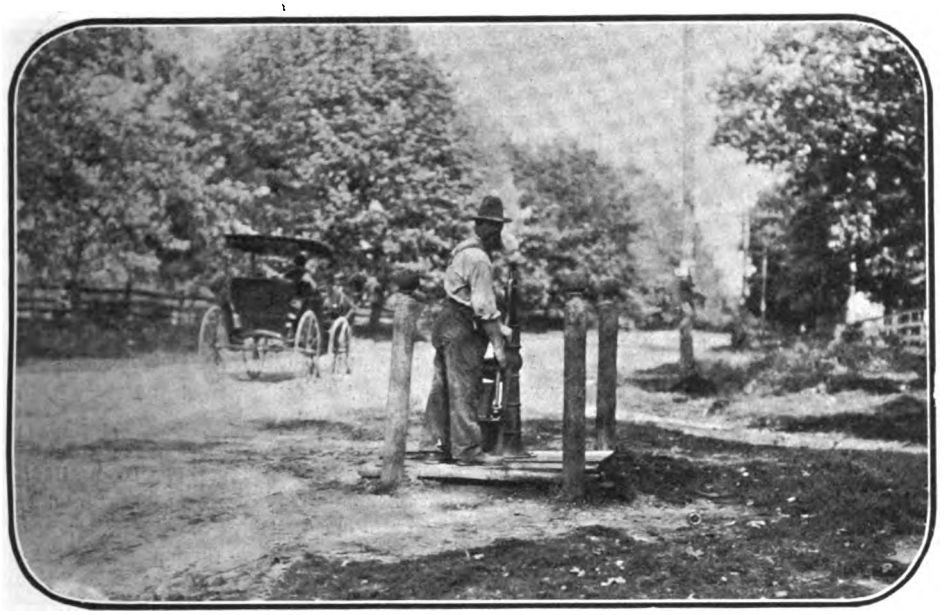
By Monday of this week all the rooms and board to be had at hotels and private houses anywhere near the course had been engaged, and no accommodations were to be had. The representatives of the several tire companies were not the least among those who engaged quarters, several concerns buying in whole hostieries for the accommodation of their men.



The practising on the course continued on Monday, and in the evening occurred the first accident, which resulted fatally and which was frightfully distorted and exaggerated by the yellow press. The 24-horsepower Pope-Toledo was the car that figured in the mishap with H. H. Lyttle, who is to drive it in the race, at the wheel, and an employe from the factory at Toledo, Harold Rigby, was injured so that he died the next morning.

THE GRANDSTAND AT WESTBURY.

The Pope-Toledo car was taken out to the course under the piloting of Henry Goodman on Monday afternoon. Harold Rigby and A. C. Anderson, both mechanics from the Toledo factory, accompanied Lyttle. It was late when the car reached the course, and as it was growing dark and Lyttle was making his first trip over the road, he kept his speed down to within twenty miles an hour. When he was nearing Hicksville, at 5:30 p. m., he passed a farmer's wagon. While driving on the side of the road, and starting to turn back, the steering knuckle broke. The farmer did not get in the way, as was reported, nor did any tire burst or come off, as most of the dailies reported. The machine was fitted with G. & J. tires, and they went through the accident unscathed.



When the steering knuckle broke the car swerved and started across the gully and the grass at the side of the road. Lyttle was driving. Rigby was sitting on the low seat beside the driver. Anderson was sitting on the gasolene tank back of Rigby, and to steady himself had his legs twined about Rigby's body. When the car started toward the fields Lyttle shut off the power and jammed the brakes on hard. The car ran about twenty feet diagonally across the grass at the side of the road, and tore down about fifteen feet of a fence and came to a halt with only one-third of the car projecting on the inside of the fence. The shock of the braking and hitting the fence threw Anderson and Rigby forward and over the side of the car, Rigby underneath. Anderson was scraped and bruised, but Rigby had three ribs broken, and they penetrated his left lung. Lyttle was entirely unhurt. The accident was just such a one as might happen at any time to a touring car. The knuckle broke because it had been chilled too quickly. The only explanation Lyttle could offer of Rigby's injuries was that he fell over the aluminum guard, or edge of the car that forms the box, with Anderson's weight on top of him. That the damage to the car was not serious was shown by Lyttle running it

THE WESTBURY PUMP—STARTING AND FINISHING POINT.

to Brooklyn under its own power that same night. The radiator was bent and the lamps smashed. Rigby died in the Mineola Hospital on Tuesday morning. Lyttle said he would drive the car in the race.

All interest on Tuesday was centred in the public hearing before the Board of Supervisors in the courthouse at Mineola. The hearing was due to a petition of protest, signed by one hundred and fifty persons, which was presented by the Peoples' Protective Association and to the efforts of individual farmers against the closing of the roads to ordinary travel in order that the race may be held. It was said by some that the supervisors had exceeded their authority in granting permission for the race. There was talk of asking for an injunction to prevent it.

As a matter of fact, the hearing turned out to be a mass meeting of citizens which passed judgment on the Board of Supervisors and sustained it. There were only four speakers in opposition to the race, although the courthouse was crowded, and when the question was put to a vote there was only one negative voice. This vote, it is said, was the sarcastic utterance of an automobilist who was "feeling good."

Wagon loads of farmers had come to town to attend the meeting, and it was supposed that they were on hand to oppose the race. When, however, the time came to speak, the farmers were as fervent as any in approving of the action of the supervisors in granting the permit.

When the farmers arrived the race commission met them with the petition signed by the great majority of Nassau County residents favoring the race upon which the supervisors had acted. Confronted by this, the obstructionists were taken aback.

William K. Vanderbilt, jr., who gave the cup that is to be raced for on Saturday to the American Automobile Association, was at the hearing, but he did not speak. A number of other automobilists of prominence and wealth were present also.

A. R. Pardington, chairman of the A. A. A. racing board, spoke in favor of the race, as did William Wyckoff, of the association. W. R. Lewis, P. J. Powers, H. J. Dietz, T. Parsons, J. Kraatz, D. M. Munger and W. H. Haydock, all residents of the county, spoke in favor of the race. Those opposed were H. M. Bennett, secretary of the People's Protective Association; James Vandeveer, A. Taylor and C. T. Meyers.

The question came to a vote of the assembled people when Timothy Treadwell, a wealthy farmer of East Williston, offered a resolution giving the supervisors a vote of confidence with respect to its action in connection with the race. It was this vote that was carried with one sarcastic vote in the negative.

After this hearing Chairman Pardington ordered that all machines traversing the course should display their numbers, and declared again that any contestant caught violating the speed limit would be disqualified for the race. This action, the fuss made over the accident and the talk of stopping the race had a salutary effect on the speeding, and there was very little of it after the hearing on Tuesday morning.

Friday is the day set for the official weighing in of the cars, for testing the telephone arrangements and the timing system. The telephone arrangements are in charge of the New York and New Jersey Telephone Co., with an expert engineer in charge, and it will be possible for the officials to communicate with all important points of the course on the day of the race.

WHAT HAPPENED WHEN CLEMENT WANDERED OFF THE MAIN ROAD.

PHILADELPHIA MEET PLEASES

Large Crowd Witnesses Good Contests—Soules Defeats Hawley in Handicap Race.

By long odds Philadelphia's best automobile race meet was held at the Point Breeze track on Saturday, October 1. Well filled and keenly contested events, interesting time trials and the largest attendance ever seen at a Quaker City meet combined to make the function an emphatic and unequivocal success.

E. E. Hawley and the E. R. Thomas 60-horsepower Mercedes were the stellar attractions, but they were pressed closely by two 24-horsepower Pope-Toledo cars, owned by Charles Potter and Leon Goodman, and driven by Frank Yeager and Charles Soules, respectively. The last named were regular touring cars, brought to the track and started almost without change, and they were so evenly matched that one scored over the other by only the narrowest of margins.

Hawley drove the Mercedes in a ten-mile exhibition event, and, although he was unable to get within reaching distance of existing records, owing to the strong wind on the stretch, he covered the distance in the creditable time of 11:35, for which he was rewarded by the plaudits of the spectators. A five-mile exhibition was also given by Tom Fetch in the Packard car which recently made a 1,000-mile non-stop run.

The best race of the day was the five-mile Point Breeze Handicap, which brought together Hawley and his Mercedes and Soules and Yeager in the two Pope-Toledos. It was run in two heats and a final heat, all three being good contests.

In the first heat the 24-horsepower Pope-Toledo car driven by Yeager, with one minute start, won easily. Yeager lost almost 15 seconds by an imperfect start, but after once getting his car in motion he won applause by the manner in which he gradually overtook and passed all competitors. The Hawley Mercedes, which started from scratch, was unable to gain on the Pope-Toledo, but finished second.

The second heat was won by Soules (24-horsepower Toledo), who had no trouble in defeating E. S. Morton (24-horsepower Peerless).

The final heat brought together the two Pope-Toledo machines, Morton's Peerless and the Hawley Mercedes. It really was a race between the Toledo cars. It produced the best contest of the afternoon, and was not decided until the final mile, when the Soules car made a fine burst of speed after rounding the first turn and maintained a lead until the finish.

The summaries:

Special five-mile race for touring cars of 24 horsepower or under, with full equipment, to carry four passengers all told, at an average weight of 140 pounds each—Won by Frank Yeager (24-horsepower Pope-Toledo).

Special race for motorcycles; first prize, $20 in gold; second prize, $10 in gold—Won by A. Wicknick (1¼-horsepower Indian); Ed. Broomfield (1¼-horsepower Indian), second; J. E. Barranger (1¾-horsepower Indian), third. Time, 8:12 2-5.

Ten-mile race, for machines of any motor power, weighing from 881 to 1,450 pounds)—Won by William Mullin (10-horsepower Ford); second, Edward Wilkie (8¼-horsepower Cadillac).

Five-mile exhibition, by Thomas Fetch, with the 1,000-mile non-stop Packard. Time of five miles, 8:19.

Five-mile Point Breeze Handicap, run in two heats and a final; three to qualify; free for all; machines of any weight and horsepower Pope-Toledo; 45 seconds); second, Frank Yeager (24 horsepower Pope-Toledo; one minute); third, E. E. Hawley (60 horsepower Mercedes; scratch).

Second heat won by Charles Soules (24 horsepower Pope-Toledo); second, E. S. Morton (24 horsepower Peerless).

Final heat won by Charles Soules (24 horsepower Pope-Toledo); second, Frank Yeager (24 horsepower Pope-Toledo); third, E. E. Hawley (60 horsepower Mercedes).

Special ten-mile exhibition by Edward E. Hawley (60 horsepower Mercedes). Time, 11:35.

LADIES RACE AT CHICAGO

Bride and Bride-to-be Add Breeziness to Meet —Fisher and Gulick Battle.

Success was writ large over the race meet held at the Harlem track, Chicago, by the Chicago Automobile Club on September 30 and October 1. There were four thousand spectators on the first day and six thousand on the second; nearly every race was well filled, and exciting contests, which were in doubt until the tape was crossed, resulted; and flights of speed, in one of which a world's record was broken, were made that aroused the spectators to the highest pitch of excitement. The public was pleased, the promoters delighted, the latter so much so that they announced that the meet would be made an annual affair. Some $3,000 was cleared, which President John Farson declared would be used as a nucleus for the building of the finest automobile clubhouse in America..

Several novel, almost sensational, features marked the meet. Barney Oldfield, who was at first looked upon as the star, elected almost at the last minute to go to Pittsburg instead. But Carl Fisher and Frank Kulick proved such thoroughly aceptable substitutes that Oldfield's non-appearance left no hiatus. Nevertheless, the club is determined to punish the famous chauffeur for his dereliction, and has, through President Farson, asked the A. A. A. to suspend him for life.

On both days contests between women took place. Friday was dubbed "Brides' Day," a special race taking place between Mrs. Dr. Reginald Smith, a bride of a week, and Mrs. L. T. Roenitz. Mrs. Smith had entered as Miss Neva Scott, but the day before the race she made public her marriage to Dr. Smith a few days previously. Miss Scott was the daring chauffeuse whose father, a well known Chicago merchant, died a few weeks ago, and she has figured in a collision and other disturbing incidents of late. She was alsc "matched" to go five miles against Dr. H. E. Thomas, but the match fell through. Saturday's events were also enriched by a race for women, in which Mrs. Smith, Mrs. Roenitz and Miss Pearl Laverty took part. Miss Laverty is the fiancee of John Farson, jr., and when something went wrong with her car just before the start she was obliged to borrow the latter's car. Being unaccustomed to this, she could do no better than finish third.

The racing honors were almost evenly divided between Carl Fisher, who drove his 45 horsepower Premier Comet, and Frank Kulick, who was at the wheel of his little 20 horsepower skeleton Ford. Fisher had a shade the best of it, however. He was twice beaten by Kulick on Friday, but turned the tables on the following day in a special race which required three heats to decide. All of them were hotly contested, the final especially being a hammer and tongs race that will be long remembered by those who saw it. It was in this heat that a world's record was made. The second mile was made in 0:59 4-5, which, with 1:01 1-5 for the first mile, made 2:02 for the two miles—record for middle weight cars. The previous best was 2:02 3-5, made by Joseph Tracy at the Empire City track on September 24.

Friday's events started with a three-mile race for cars of all classes, the machines to line up with a dead engine and passengers to dismount at end of each mile. This afforded great amusement to the crowd, the motorists in their eagerness running over the line and committing other breaches of the rules. The race was won by W. Knipper, driving a 24 horsepower Pope-Toledo, who took the lead at the start and had no trouble keeping it.

The second race, which was for runabouts, went to O. E. Schell, in a 12 horsepower Michigan, the only other starter, G. E. Holmes, using the same make of car, being badly beaten.

The first clash between the fast cars came in the third race for cars weighing 881 to 1,432 pounds, Kulick and Fisher coming to the starting point. The Ford passed the line at a fast rate, leading Fisher's Comet by a length. The machines raced the first lap in nearly the same position, Fisher gaining on his rival just a trifle and both passing the stand with a whirr of wheels and throwing the dust high in the air. At this stage it was even, but, hitting the homestretch on the third lap, the Comet missed several times and Kulick raced his machine an eighth of a mile into the lead. From then to the finish there was no change, Kulick being unable to gain further, but holding his advantage past the wire.

The four speediest cars of the meet—the Ford, Premier, Pope-Toledo and Apperson—came together in the five-mile event for cars of any motive power or weight. They were sent off with the Ford car crossing the line first, with the Premier second, the Pope-Toledo third, the Renault and the Apperson following. Kulick shot around the first lap in the lead, with the Premier close up, the Pope-Toledo, driven by Lytle, coming next, with the Apperson car following.

There was little change in the positions for the remainder of the race, the Ford car skimming over the ground at too fast a pace for any of the others, with the exception of Fisher's machine, which was acting its best, but was unable to overcome the Ford's lead.

There were thirteen starters in the ten-mile handicap, which was won by F. O. Tallman,

CARL FISHER, WHO WON THE MATCH RACE.

Digitized by Google

in a Renault, who had an advantage of six minutes and a half over Kulick, who was on scratch. Ed Apperson, with his "Jackrabbit," was second, with two minutes and a half start, and third honors were taken by O. E. Schell, credited with eight and one-half minutes. The handicaps to the lesser lights were so generous that Kulick and Lytle had little chance to even finish one, three. The Ford machine made up a lot of ground and traveled the ten miles at a fast clip, cheered on by the crowd, but the handicap was too great.

Only two started in the pursuit race, Apperson and Fisher. The machines were started at different sides of the track, the race ending when either was passed. The Comet was much the speedier car, and Fisher succeeded in passing the Apperson after three and one-eighth miles had been covered. The summaries:

Three miles, for cars all classes, each car to line up with dead engine, and passengers to dismount at end of each mile—Won by W. Knipper (24 horsepower Pope Toledo); A. G. Schmitt (40 horsepower Apperson), second; J. A. Ellis (40 horsepower Apperson), third. Time, 6:49 1-5.

Five-mile, for light runabouts—Won by O. E. Schell (12 horsepower Michigan); G. E. Holmes (12 horsepower Michigan), second. Time, 10:28.

Five miles, for cars weighing 881 to 1,432 pounds—Won by Frank Kulick (20 horsepower Ford); Carl Fisher (40 horsepower Premier Comet), second. Time, 5:27.

Five miles, open to cars of any motive power or weight—Won by Frank Kulick (20 horsepower Ford); Carl Fisher (45 horsepower Premier Comet), second; Herbert Lytle (24 horsepower Pope-Toledo), third. Time, 5:29.

Two miles, for woman's championship of Chicago—Won by Miss Neva E. Scott (24 horsepower Locomobile); Mrs. L. P. Roenitz (24 horsepower Pierce-Arrow), second. Time, 4:24.

Ten-mile handicap—Won by F. O. Tallman (14 horsepower Renault), 6:30; Edward Apperson (24 horsepower Apperson), 2:30, second; O. E. Schell (12 horsepower Michigan), 8:30, third. Time, 16:38.

Pursuit—Won by Carl Fisher (45 horsepower Premier-Comet); Edward Apperson (24 horsepower Apperson), second.

Saturday's star event was the special five-mile heat race between Carl Fisher and Frank Kulick. It required the full three heats, Kulick winning the first, and Fisher the second and third. Kulick won the first heat by the most spectacular driving of the afternoon, passing Fisher on the far turn in the last mile after Fisher had led throughout. Amid tremendous excitement he flashed past his opponent, through the cloud of dust on the turn, swinging into the stretch three lengths to the good and holding that advantage to the wire. Time, 5:27 4-5 from a standing start.

The second heat brought out the best contest on the card, the men alternating in the lead, passing and repassing one another. On the far turn in the second mile Fisher struck the inner rail with his hind wheel, tearing out a board and nearly upsetting. He dashed on without faltering an instant, and won the heat by a scant length. Time, 5:29 2-5.

The fastest mile of the day was made in the third heat, Fisher doing it in 0:59 4-5 and winning the heat (and race) in much easier fashion than he did the second heat.

After the race Fisher went against the world's record of 0:59, for middle weight cars, but 1:01 4-5 was the best he could do.

The five-mile race for the Manufacturers' diamond cup also was taken by Fisher, in a field of four. Kulick was second, a furlong back. W. Knipper finished third. Time, 5:15 3-5.

Applause greeted the three contestants in the three-mile race for women. Miss Neva E. Scott, winner of Friday's race, had to be content with second place, the race going to Mrs. L. T. Roenitz, who won by a large margin in 6:12. Miss Pearl Laverty was third.

After the speed of the five-mile contests the slow race proved a novelty. In this the aim was to drive the machines as slow as possible for half a furlong without actually stopping, the last man winning. Only two contestants finished, the other going so slowly that they finally came to a standstill. F. X. Mudd, in a Cadillac, won, second place going to W. S. Austin. The summaries:

Five miles, for Diamond cup—Won by Carl G. Fisher (45 horsepower Premier Comet; Frank Kulick (20 horsepower Ford), second; W. Knipper (24 horsepower Pope-Toledo), third. Time, 5:15 3-5.

Five miles, for Chicago Automobile Club members—Won by Ed Apperson (24 horsepower Apperson); O. F. Weber (24 horsepower Pope-Toledo), second; W. S. Austin (35 horsepower Austin), third. Time, 6:28.

Three miles, ladies' race—Won by Mrs. L. T. Roenitz (24 horsepower Pierce-Arrow); Miss Neva Scott (24 horsepower Locomobile), second; Miss Pearl Laverty (24 horsepower Packard), third. Time, 6:12.

Five-mile special—First heat won by Frank Kulick (20 horsepower Ford); Carl G. Fisher (45 horsepower Premier Comet), second. Time, 5:27 4-5.

Five-mile special—Second heat won by Carl Fisher (45 horsepower Premier Comet); Frank Kulick (20 horsepower Ford), second. Time, 5:29 2-5.

Five-mile special—Final heat won by Carl Fisher; F. Kulick, second. Time, 5:10 2-5.

Five miles, for cars weighing 1,432 to 2,204 pounds—Won by Herbert Lytle (24 horsepower Pope-Toledo); W. Knipper (24 horsepower Pope-Toledo), second; L. D. Sheppard (18 horsepower Sheppard), third. Time, 6:22.

Half-mile slow race—Won by F. X. Mudd (6 horsepower Cadillac); A. S. Austin (35 horsepower Austin), second.

Ten-mile handicap—Won by C. Weber, 7:00 (24 horsepower Pope-Toledo); O. F. Weber, 6:30 (24 horsepower Pope-Toledo), second; Herbert Lytle, scratch (24 horsepower Pope-Toledo), third. Time, 15:44.

PITTSBURG ADMIRES OLDFIELD

He Proves the Star of Smoky City's Two Days Meet—Steam Cars Score.

Barney Oldfield was the central figure of the two days' race meet held by the Pittsburg Automobile Club at Brunot's Island, Pittsburg, Pa., on September 30 and October 1. His appearance had been well heralded, and the 13,000 people who crossed in boats to the island during the two days' racing went there principally to see him. He rewarded them by giving three thrilling and characteristically Oldfieldian exhibitions in his Peerless car—two on Friday and one on Saturday. In neither did he equal the existing records, the strong wind and the difficult turns making this out of the question. But he drove miles in and around one minute, and his rapid progress around the track evoked thunders of applause.

The meet itself was markedly successful. The programmes of both days were long and but for the snappy way in which they were run off by Referee W. C. Temple and his fellow officials, would have been drawn out to a tiresome extent. A number of good contests took place, the various races nearly all having, contrary to the usual experience, plenty of starters. Webb Jay was the only out-of-town driver of note—excepting Oldfield—but he was eclipsed by George E. Turner, a local man, who drove well and was remarkably successful.

In spite of the fact that he was one of the victims of a serious automobile accident in Allegheny a few days before, Turner drove his own cars in a style that was little less sensational than that displayed by Oldfield. Turner appeared in a gray coat, a slouch hat and with his face covered with strips of adhesive plaster. He was given a warm reception by the crowd, and was cheered and cheered again when it was seen that he knew a few things about the game which are supposed to belong exclusively to the professional members of the racing fraternity.

On the opening day, the first event was a five-mile race for cars up to 24 horsepower, with road equipment, but no passengers. It was won by George E. Turner, with a Peerless car, in 6:45½. There were six entries, the others being a Pope-Toledo, entered and driven by E. Kneeland; a Pope-Toledo, entered by W. N. Murray and driven by William Soules; a Pierce, entered by W. C. Temple and driven by George Ferrier; a Richard, entered and driven by O. E. Vestal; a White, entered by O. E. Vestal and driven by Webb Jay.

A two-mile race for automobiles up to 9 horsepower, with road equipment but no passengers, came next. There were three entries, George H. Flinn's Peugeot, which he drove himself, winning in 3:51¾. The other entries were a Cadillac, by A. L. Banker, driven by D. P. Collins, which took second place, and a Stevens-Duryea, entered

Digitized by Google

by O. E. Vestal and driven by M. F. Leslie, which took third place. The first mile was made in 2:05¼ and the second mile in 1:46½. The Peugeot finished easily first and could have won by more than a mile had the driver pushed it to the limit.

In the third event, a ten-mile race for stock touring cars up to 35 horsepower, with road equipment and no passengers, George E. Turner captured first prize, making his second win for the day. He drove a Peerless and made the ten miles in 13 minutes and 14 seconds. W. N. Murray's entry, a Pope-Toledo, driven by William Soules, was second; a White, entered by O. E. Vestal, and driven by Webb Jay, was third.

A five-mile race for automobiles up to 16 horsepower, with road equipment and no passengers, was the fourth number on the card, and was won by a White steam car, entered by O. E. Vestal and driven by Webb Jay. The time was 8:35.

Next came the five-mile exhibition against time by Oldfield. The first mile was covered in 1:02 4-5, second in 1:01 3-5, third in 1:02 1-5, fourth in 1:02 3-5 and the fifth in 1 minute flat.

In the fifth event, a five-mile race, with no restrictions, Oldfield won, with a Peerless 24-horsepower car. The distance was covered in 6:37½. There were but two other entries in the race—O. E. Vestal with a White, driven by Webb Jay, and W. N. Murray with a Pope-Toledo, driven by E. H. Beldon. Vestal's machine was a 24-horsepower Pope-Toledo.

The last event of the day was a five-mile handicap, and had sixteen entries. The race was split into two heats, eight machines going in the first heat and eight in the second. The two first in each heat raced in the finals. The handicap was preceded by another exhibition race by Oldfield, in which he went three miles in the Peerless Green Dragon. He could not better his first time, the first mile being made in 1:04, the second in 1:01 and the third in 1:00 flat, making the time 3 minutes and 5 seconds for the three miles.

The summaries:

Five miles, for 24-horsepower cars, with road equipment; no passengers—First, George E. Turner (24-horsepower Peerless); second, William Soules (24 horsepower Pope-Toledo); third, Edward Kneeland (24-horsepower Pope-Toledo). Time, 6:45½.

Two miles, for automobiles up to 9 horsepower, with road equipment—First, George H. Flinn (9-horsepower Peugeot); second, D. P. Collins (8-horsepower Cadillac); third, M. F. Leslie (7-horsepower Stevens-Duryea). Time, 3:51¾.

Ten miles, for stock touring cars up to 35 horsepower—First, George E. Turner (24-horsepower Peerless); second, William Soules (24-horsepower Pope-Toledo); third, Webb Jay (15-horsepower White). Time, 13:14.

Five miles, for cars up to 16 horsepower, with road equipment—First, Webb Jay (15-horsepower White); second, E. Haas (15-horsepower Pierce). Time, 8:35.

Five-mile exhibition—Barney Oldfield (80-horsepower Peerless). Time, 5:09.

Five miles, open—First, Barney Oldfield (24-horsepower Peerless); second, Webb Jay (15-horsepower White); third, E. H. Beldin (24-horsepower Pope-Toledo). Time, 6:37¼.

Three-mile exhibition—Barney Oldfield (80-horsepower Peerless). Time, 3:05.

Five-mile handicap, open—First heat: First, G. Ferrier (24-horsepower Pierce); second, O. E. Vestal (20-horsepower Richard). Second heat; First, Barney Oldfield (24-horsepower Peerless); second, George E. Turner (24-horsepower Peerless). Time, 5:49 3-5. Final heat: First, Barney Oldfield (24-horsepower Peerless; scratch); second, G. E. Turner (24-horsepower Peerless; 10 seconds handicap); third, G. Ferrier (24-horsepower Pierce; 1:30 handicap). Time, 5:47.

The feature of the second day was the work of the White steam cars. They captured three events in splendid style, O. E. Vestal accounting for two of them and Webb Jay for the third. Oldfield, in the 24 horsepower Peerless, took the lead in the ten-mile race for striped touring cars, and before five miles were covered it was seen that he was gaining steadily on the 24 horsepower Peerless driven by G. E. Turner, and the 24 horsepower Pope-Toledo driven by M. H. Beldin. After eight miles had been covered Oldfield rapidly gained, and at the finish led Turner by half a mile, and Beldin was a full mile in the rear.

In the five-mile exhibition Oldfield quit after going three miles, owing to some of his cylinders failing to fire. The times were 1:04 3-5, 0:59 2-5 and 0:58 1-5.

The two-mile Cupid brought forth much amusement. In this event the drivers, who were in their machines, jumped from the seats at the crack of the gun, cranked their engines, and, after covering a mile, stopped and picked up a lady pasenger, then started and finished a second mile. O. E. Vestal, in a White steamer, easily won in 3:14.

The five-mile handicap was run in three heats and a final, the first in each of the preliminaries being eligible to compete in the final. In the first heat W. N. Murray, in a 10 horsepower Franklin, with a handicap of 20 seconds, easily won, with T. E. Gamble, in a 10-horsepower Autocar, with a handicap of 30 seconds, half a mile in the rear. The second heat went to Lester Wilson, in a 24 horsepower Pierce and with a handicap of 1:10, with E. Kneeland, in a 24-horsepower Pope-Toledo and a scratch man, second. The other contestants were distanced. In the third heat O. E. Vestal, in his 15 horsepower White steamer, had a start of almost a mile before Oldfield got under way, but Oldfield gradually cut down the lead and won the heat. In the final Oldfield, who was scratch, passed L. Wilson, in his 24 horsepower Pierce and who had a handicap of 1:50, at three miles, and then set out hot in pursuit of Vestal's White, which he did not overtake till near the finish, when he left it by several lengths before crossing the tape.

Summaries:

Two-mile, for cars up to 24 horsepower, with full road equipment, but no passengers—Won by Webb Jay (15 horsepower White steamer); G. E. Turner (24 horsepower Peerless). second; Ed. Kneeland (24 horsepower Pope-Toledo), third; William Soules (24 horsepower Pope-Toledo), fourth. Time, 2:46.

One-mile, for cars up to 9 horsepower, road equipment, but no passengers—Won by D. P. Collins (8 horsepower Cadillac); George Finn (9 horsepower Peugeot), second; J. A. Pretch (7 horsepower Stevens-Duryea), third. Time, 2:12 3-5.

Two-mile Cupid—Won by O. E. Vestal (15 horsepower White); G. E. Turner (24 horsepower Peerless), second; Edward Kneeland (24 horsepower Pope-Toledo), third; Lester Wilson (24 horsepower Pierce), fourth. Time, 3:14.

Two-miles, for cars up to 16 horsepower, road equipment; no passengers—Won by O. E. Vestal (15 horsepower White); George Stranahan (10 horsepower Franklin), second; A. L. Banker (15 horsepower Pierce), third; T. S. Gamble (10 horsepower Autocar), fourth. Time, 3:35.

Ten-mile, for touring cars up to 35 horsepower, stripped—Won by Barney Oldfield (24 horsepower Peerless); G. E. Turner (24 horsepower Peerless), second; M. H. Beldin (24 horsepower Pope-Toledo), third. Time, 10:40 1-5.

Five-mile handicap, open—First heat won by W. N. Murray, 0:30 (10 horsepower Franklin); T. E. Gamble, 0:30 (10 horsepower Autocar), second; time, 8:46. Second heat won by Lester Wilson, 1:10 (24 horsepower Pierce); E. Kneeland, scratch (24 horsepower Pope-Toledo), second; time, 7:34 3-5. Third heat won by B. Oldfield, scratch (24 horsepower Peerless); O. E. Vestal, 1:25 (15 horsepower White), second; time, 5:26 3-5. Final heat won by B. Oldfield, scratch; L. Wilson, 1:50, second; O. E. Vestal, 0:25, third.

Chicago Seeks Oldfield's Scalp.

President John Farson, of the Chicago Automobile Club, is wroth with Barney Oldfield, and intends to have his head for alleged breach of contract, in not appearing in the Windy City last week. He has demanded of the American Automobile Association that Oldfield be suspended for life, and is quoted as saying that unless such action is taken the Chicago club will withdraw from the A. A. A.

It appears that Oldfield's manager signed contracts with both the Chicago and Pittsburg clubs. Then, the manager claims, he appealed to Chairman Pardington of the A. A. A. racing committe to know what to do, and was told to have Oldfield drive at Pittsburg.

The matter came up in this city on Tuesday, when Secretary Spangler of the Chicago club appeared at the meeting of the A. A. A. directors and asked for Oldfield's suspension. It was decided, after a lengthy discussion, to refer the matter to the racing board.

INDIA'S FIRST CONTEST

Takes Place Christmas Week Over 883 Miles of Roads Near Bombay.

Some further particulars are now available of the 883 miles reliability contest which the Motor Union of Western India are arranging to take place between Delhi and Bombay during Christmas week this year.

The objects of the trial as propounded by the Motor Union of Western India are: (1) To bring prominently before the Indian public the fact that motor cars have been brought to such a stage of perfection that they are eminently suitable for use in India, more especially for district work; (2) to induce tourists visiting that country to bring their cars with them, and thus take advantage of the magnifcent roads and perfect weather, which are invariably assured to the traveller between the months of October and March; (3) to call the attention of manufacturers in Europe and elsewhere to the wants of India in the matter of motor cars.

Following is a statement of the approximate distances to be traversed, although the committee reserve the right of altering these to any extent, as may be found desirable:

	Miles.
Monday, Dec. 26, Delhi to Agra	128
Tuesday, 27th, Agra to Gwalior	71
Wednesday, 28th, Gwalior to Goona	127
Thursday, 29th, Goona to Sarangpur	94
Friday, 30th, Sarangpur to Indore	74
Saturday, 31st, Indore to Dhulia	145
Sunday, Jan. 1, Dhulia to Nasik	97
Monday, 2d, Nasik to Bombay	147
Total	883

The following rules in connection with the cup presented by the Gaikwar of Baroda have been drawn up by the committee of the Motor Union of Western India:

1. The race for the cup is to be one judged by reliability only, although it is probable that other prizes will be given for (a) the car in best condition after the trial, (b) the car best suited for district work in India and (c) absence of noise, etc.

2. The trial will be open to any motor vehicle privately owned, with the exception of motor bicycles, tricycles and quadricycles (for which there will be separate competition).

3. All cars competing shall be driven by amateurs.

4. Each car shall carry an observer, who shall faithfully record any stops of the engine or car while travelling between Delhi and Bombay.

5. The cup will be presented outright to the owner of the car which makes the whole journey with the least number of unauthorized stops, and in the event of any cars tieing for the cup, such cars will undergo further trials for hill climbing or otherwise, as may be decided by the committee, in order to determine which car is the most reliable under all conditions.

6. The distance between Delhi and Bombay, approximately 880 miles, is to be traversed by the cars competing between December 26 and January 2, inclusive.

7. The timing of the cars between any two places will be made on a basis of twelve miles an hour as a minimum and thirty miles an hour as a maximum speed.

8. The entrance fee is to be 50 rupees a car (three guineas), and the fees are to be devoted to making provision for the race.

9. The maximum number of marks to be allotted shall be 1,000, and one mark is to be deducted from this number for every minute during which the car is stopped on the road from any cause whatever, other than of traffic, level crossings, rivers or such impediments as the committee may specially exempt. No repairs, adjustments or alterations can be made to cars or engines without loss of marks during the transit of cars from place to place. In the case, however, of stops due to tire troubles, only half of a mark a minute will be deducted.

10. No tools or spare parts of any kind are to be brought on to the car during the trial without disqualification, but there is no limit to the number of tools and spare parts which a car may carry during the trial, provided such are upon the car at the time of its departure from Delhi.

To Form Chauffeurs Into Unions.

"Do you belong to the union?" will soon be the question asked of chauffeurs if plans laid at Indianapolis, Ind., do not miscarry. The International Brotherhood of Teamsters, of that city, has decided to organize the chauffeurs of the country, and local unions are to be established in all the principal cities and to be affiliated with the teamsters' organization.

It is said that the chauffeurs are really drivers of vehicles, but under another name, and that for this reason they should belong to the organization of teamsters. It is said that there has been talk of the chauffeurs organizing a union of their own, and for this reason the teamsters determined to organize them and claim jurisdiction over them.

Tray Made to Carry Trunks.

An ingenious device for carrying bags or even a small trunk has been brought out by an English maker. It consists of a strong yet light tray, which is arranged to slide under the floor board of the tonneau, and, when thus put away, is entirely out of sight, as the front edge of the tray comes flush with the carriage work. When in use a pair of straps are employed for supporting the weight of the free end. The increasing popularity of long distance travelling, and the advantages of having some, at least, of the personal luggage on the car, make the utility of a carrier at once apparent.

Fast automobiles for inspection and emergency work have been ordered by the Colorado & Southern Railroad for the use of division officials on their tracks in Colorado.

JERSEY LICENSE MILL BUSY

Last Week in September Broke All Records—Total of Registrations is 7,349.

When the office of the New Jersey Secretary of State closed for the month on September 30, the automobile department was shown to have been the busiest for the last week of any in its history, since the law was passed and signed, in March, 1903.

Commencing Monday morning of last week, the clerks in this department worked all day, and sometimes into the night, to get out the licenses. It is the rule of this department that all applications which are regular in form must be attended to the day received. This rule was put in force because the State law will not allow any one a minute to operate his machine in the State without a license. So as not to work hardships to new purchasers of automobiles, the Secretary of State gets the license to the applicant as soon as the mail can carry it.

The great rush for licenses the last week was due to the wish of Pennsylvanians and New Yorkers to visit the Interstate Fair, as all the applicants wanted licenses for touring cars, and wanted them in time to visit the fair. One especially anxious man asked if the Secretary could not telegraph his license.

In the palmy days of licensing automobile owners to operate machines fifty licenses a week was a big week's work. This number was exceeded last week, when seventy licenses were issued.

The total number of licenses issued to date is 7,349, and fully 79 per cent are for touring cars. The applicants of last week were for the most part people who reside out of the State. There was one application from a Louisiana man, but he was stopping in Baltimore, and another application from a Vermonter. He was in the City of Brotherly Love.

Regarding the proposed revision of the automobile law, the office is in receipt of letters from people who agree with Senator Bachelor, of Essex, that it would be well to amend the law so that a person touring in New Jersey is compelled to remove the license numbers of other States from his machine. It is contended that constables make mistakes and cause all sorts of annoyance by stopping autoists to be sure that among the many numbers on their machines one is the simon-pure Jersey brand.

Anything which will keep the constables from annoying is favored by the correspondents.

Jersey Clubmen Secure Quarters.

Rooms in the building at Harrison and Railroad streets, Brick Church, have been secured by the Automobile Club of New Jersey. The building contains a garage, which is at the disposal of the members.

OBJECT LESSON IN ROADS

Canadian Warden Inaugurates Improved Highway System with Run of Motorists.

The county of Wentworth, Ontario, has a wise warden, Edward Kenrick, who recently celebrated the practical inauguration of a good roads system by the largest automobile run that has ever taken place in Canada.

The agitation for good roads begun by the government some years ago took a firm hold in Wentworth County, and the first fruits of it were seen on this occasion by a number of interested visitors. Under the good roads act the county of Wentworth has purchased a number of toll roads and secured as a government bonus one-third of the cost. The expenditure for the permanent improvement of these roads has been considerable, and in view of the nature of the work the government has consented to bear the same proportion of the extra outlay. Already some fifty miles of highway in the county have ben built up in accordance with the most modern ideas of roadmaking, and the celebration of the accomplishment was quite in keeping with its performance.

Warden Kenrick, who wished to show off the new roads, knew that they would be most welcomed by the touring automobile parties who visit the Wentworth district to enjoy the exquisite scenery, and also that the roads could best be viewed from an automobile. He therefore enlisted the aid of his motorist friends and got together a party of seventy persons, under the care of Dr. P. E. Doolittle and S. O. Greening, presidents of the Toronto and Hamilton Automobile clubs.

The party left Hamilton early in the day and rode over miles of the finest highway to be found in any country. A straight run was made around the arm of the bay to Watertown, and then along the Sydenham Road to Greensville, after which the party strung down the side of the ridge to Dundas. The tour had evidently been well advertised, for at every corner the rural residents and their families were in waiting to give the tourists a cheery salute, and in the villages all of the available flags were hung out.

At Ancaster, the home of the warden, about seven miles away, the entire populace turned out, and there was a general ovation. From this village the party enjoyed an ideal run down to the city of Hamilton, over a road which, like all of the other county works traversed during the day, showed evidence of careful and admirable construction. There was barely time for luncheon at the Waldorf in Hamilton before the run was resumed, and the party started for Stony Creek, where another welcome was given them. From there to Elfrida, as on other sections of the route, a scene of great beauty stretched out to the water beneath them. At Mountain View the warden entertained his guests at afternoon tea, at which many congratulatory addresses were made.

French Heavy Wagon Tests Now On.

Valuable and extremely practical data should be obtained as a result of the heavy wagon tests, which were scheduled to start this week in the neighborhood of Paris, under the supervision of the French Minister of War.

The competition is confined entirely to vehicles suitable for the transport of men and stores for army purposes, constructed in France by French manufacturers. The tests will occupy eight days, during which a distance of 510 kilometres will be covered over four different routes. Both steam and internal combustion motors are qualified to take part, and the great point to be sought for in the internal combustion motors is that they shall be able to use either spirit, heavy oil, pure alcohol or a mixture of alcohol equally well. Any vehicle coming up to such a pitch of perfection will specially receive the attention of the jury.

The total weight of each vehicle fully laden must not exceed 3,400 kilograms, of which 1,000 kilograms at least must be useful load. Electric ignition must be employed, magneto for preference, and each vehicle must have at least three speeds and a reverse gear, with minimum and maximum speeds of 3½ and 18 kilometres an hour, respectively. The fuel tanks must provide for at least a 75 kilometre run without replenishing.

Gliddens Sail for Honolulu December 9th.

Although the Charles J. Glidden party reached Vancouver, B. C., several weeks ago, they will not enter upon the next stage of their journey around the world for some little time. Passage has been booked on the Canadian-Australian steamship Moana, which sails from Vancouver on December 9, arriving at Honolulu on December 17, and Luva, in the Fiji Islands, on December 27. On this island a drive of two hundred miles has been planned, after which the boat will be taken to Auckland, New Zealand, due there on January 11.

The New Zealand drive begins at Auckland and terminates at the southern end of the south island, at Invercargill. Steamer will be taken to Tasmania, and from Hobartown a drive of three hundred miles will be made. From Melbourne the Australian drive of two thousand miles will be started. After this comes the Philippines, China and Japan, then the Asiatic archipelago, Ceylon and India, crossing the corner of Asia and through Europe to London in 1906.

Search for a Word.

There is no suitable word in the English language to compare with the French en panne (which, by the way, is borrowed from nautical circles, and means "lying to"). "Breakdown" is the word usually employed, but this hardly describes such a trouble, for instance, as a sooty plug, a cut tire, a run down battery and many another of the little ills that motors are heir to. There is no suggestion, in the remotest degree, of "breakage" in any of the above cases.

TO BRAVE DEATH VALLEY.

California Professor Plans Automobile Trip Through Ill-omened Region in Search for Gold.

The exploitation of the grewsome Death Valley by the automobile will soon be an accomplished fact. In addition to the installation of a service of motor transportation for hauling borax, in place of the twenty-mule teams heretofore used, a California professor is going prospecting for gold in an automobile.

Professor Gilbert E. Bailey, of San Francisco, is the adventurer in question, and he will search for gold mines in the Death Valley region, which has proved fatal to hundreds of prospectors because of the intense heat and the difficulty of carrying across it supplies of food and water. Professor Bailey's automobile is a strong runabout, to which he has made a number of attachments for carrying implements and supplies. He will test its capacity by some preliminary tests in Southern California. Professor Bailey, who is an expert mining engineer and assayer, will follow up the valley of the Amargosa River and will thoroughly explore Funeral Mountains and Furnace Creek.

Every one knows this region is rich in minerals, but parties that have ventured into it even in winter are forced to carry a large outfit to guard against death by thirst. For three prospectors eight horses are necessary, six being devoted to hauling foodstuff. This makes travel slow.

Professor Bailey will follow a new road into Death Valley made by the Pacific Coast Borax Co. This company will supersede the old twenty-mule team by traction engines and trains of wagons. Recent discoveries of rich ore near Furnace Creek show that Death Valley has never been thoroughly prospected.

Profit in the Paying Passenger.

The newest development in the automobile industry, according to a London dispatch, is taking the paying guest as passenger.

It is claimed for the idea that there is no more pleasing method of seeing Great Britain and spending a day or two at historic spots by the way. The cost runs into from $10 to $20 a day, according to the country visited, but the paying guest is privileged to discharge his own hotel bills and contribute a proportionate share to the cost of luncheons and teas on the roads.

One automobilist who recently took three Americans as paying guests on a few weeks' tour cleared $400 on the trip after paying his own and the chauffeur's expenses.

Pledged Auto at Paris Pawnshop.

For the first time in the history of the Mont de Piete, Paris, pawnbroking department an automobile was pawned with it recently. The proprietor drove his automobile slowly into the courtyard of the pawnbroking office in the Rue Servan, and, after satisfying the official the machine was really his property and in goood condition, was allowed an advance on it.

The Week's Patents.

770,726. Running Gear. Albert F. Madden, Newark, N. J., assignor to Vehicle Equipment Company, New York, N. Y., a corporation of New York. Filed January 12, 1904. Serial No. 188,683. (No model.)

Claim—1. The combination with an axle and a vehicle body yieldingly supported thereby, of a pedestal constituting a guide for the axle, carried by the body midway of the axle, means engaging the guide to prevent transverse displacement of the axle relative to the body, pivotal connection between the axle and said means to permit vertical movement of the axle ends independently of each other, and a pedestal at each end of the axle forming guides or rails therefor, as set forth.

770,728. Running Gear for Vehicles. Albert F. Madden, Newark, N. J., assignor to Vehicle Equipment Company, New York, N. Y., a corporation of New York. Filed March 10, 1904. Serial No. 197,608. (No model.)

Claim—1. The combination with an axle and a vehicle body yieldingly supported thereby, of a pedestal constituting a guide for the axle, carried by the body midway of the axle, means carried by the axle and engaging the guide to prevent transverse displacement of the axle relative to the body, pedestals at the ends of the axle forming guides or rails therefor to prevent longitudinal movement of the axle relative to the body, braces connecting the lower parts of the pedestals, and diagonal braces between the body and the lower part of the central pedestal, as set forth.

770,820. Variable Speed Transmission Gearing. Thornton B. Rennell, Denver, Col. Filed July 3, 1903. Serial No. 164,119. (No model.)

Claim.—1. In a variable speed transmission gearing, a main driving shaft, an auxiliary driving shaft, a transmission shaft and clutch mechanism for connecting the respective shafts, as described, a shaft arranged to be driven by said connected shafts, and gear wheels arranged upon certain of the connected shafts, in combination with a swinging support, a counter shaft with gear wheels carried by said support, and means for oscilating said support to bring the gear wheels of the counter shaft into and out of mesh with the gear wheels of the connected shafts.

770,840. Thrust bearing. Walter C. Baker, Cleveland, Ohio, assignor to the American Ball-Bearing Company, Cleveland, Ohio., a corporation of Ohio. Filed July 25, 1901. Serial No. 70,193. (No model.)

Claim.—1. In combination with a shaft, a thrust-bearing comprising a pair of rings encircling the shaft, and rings having their inner faces recessed, compressible material arranged in one of said recesses, a second ring bearing on said compressible material, means arranged in the recess of the other of the first-named rings, and formed with a ball-race, means arranged in the ring bearing on said compressible material, and formed with a ball-race, and balls engaging said ball-races, substantially as described.

770,896. Mold for tires. Charles G. Fawkes, Denver, Col., assignor to The Fawkes Rubber Company, Denver, Col. Filed September 19, 1903. Serial No. 173,910. (No model.)

Claim.—1. A tire mold provided with pins radially disposed and projecting from the inner periphery of the mold into the hollow of the latter.

2. A tire mold composed of two members, one of which is provided with pins or projections radially disposed and adapted to form recesses on the inner periphery of the tire formed or vulcanized therein.

770,927. Ignition plug for explosive engines. William Roche, Jersey City, N. J. Filed December 4, 1903. Serial No. 183,718. (No model.

Claim.—1. An ignition plug for explosive engines, comprising a tabular metal plug the interior surface thereof at the inner end being bevelled, a tubular insulating plug therein the exterior surface at the inner end thereof being bevelled, a tubular insulating sleeve fiting within said insulating plug, and a conductor within said insulating sleeve projecting out of the inner end thereof, the inner ends of said conductor and said metal plug serving as sparkling terminals, substantially as described.

771,077. Change-speed gearing. Abraham B. Landis, Waynesboro, Pa. Filed April 18, 1902. Serial No. 103,594. (No model.)

Claim.—1. In a speed-changing gear, the combination, of two sets of gear wheels forming two cones mounted on parallel shafts and engaging with each other, said parallel shafts, one of which has its gear whels rigidly secured thereon, and the other of which is hollow and has its gear wheels mounted loosely thereon, sliding locking devices formed with central transverse ways with cam faces on each side thereof mounted in transverse perforations in said hollow shaft and adapted to engage notches in the hubs of said gear wheels, and a rod within said hollow shaft mounted to slide in the central ways in said locking devices and provided with a series of operating cam faces arranged to engage the cam faces of said locking devices successively to move one to engage its gear wheel and to lock all of the others out of engagement with their wheels, whereby only one wheel can be locked into engagement with the shaft at a time, substantially as set forth.

771,095.—Gas engine. Eugene C. Richard, Detroit, Mich., assignor to Buick Manufacturing Company, Detroit Mich., a corporation of Michigan. Filed February 18, 1902. Serial No. 94,682. (No model.)

Claim.—1. In an explosion engine, the combination with the cylinder, a valve stem passing outward through the head of said cylinder, a spring sleeved upon said stem, a cupped collar secured to said stem and forming a bearing for said spring, an outwardly projecting flange in said collar, a bifurcated lever having antifriction rolls bearing upon said flange on opposite sides of said collar, a jug on said head to which said lever is pivoted, a push rod slidingly secured in a bearing at the side of said head and an antifriction roll secured to the opposite end of said lever bearing against the end of said push rod.

771,156. Valve for pneumatic tires. John E. Keller, jr., Litchfield, Conn. Filed December 29, 1903. Serial No. 186,986. (No model.)

Claim.—1. In a structure of the character specified, a valve tube, a valve mechanism including a tubular valve casing and a valve plug secured in the outer end of said casing, a packing washer disposed between the end of said casing and the upper portion of the mechanism in said valve tube with the packing washer in contact with the bore of said valve tube.

771,190. Pneumatic tire guard. Laurent Vanderperre-Simon, Brussels, Belgium. Filed July 17, 1903. Serial No. 165,988. (No model.)

Claim.—1. A pneumatic tire having an air tube and a protecting tissue between said tire and tube, with propecting bearing plates secured to the outer tube and to said protecting tissue.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—At Low Prices: Standard 4 Cycle Motors; Single Cylinder, 3½ H P.; Double Cylinder 8 and 12 H. P. for Automobiles. Same with bases for launches. N. B. HARRINGTON & CO., 106 Broadway, Buffalo, N. Y.

FOR SALE—Crest Model D with tonneau, nearly new, perfect condition, brand new tires; have larger car; price, $675. Dr. C. E. COOK, New London, Iowa.

SEND stamp to C. A. Coey & Co., 53rd and Cottage Grove, Chicago, for the largest list of second-hand machines ever issued.

FOR SALE AT A BARGAIN—Quantity new Elbridge latest type "R" Sparking Dynamos, for either belt or friction drive. Fully enclosed with sub-adjustable base. Most complete and efficient Automobile Ignitor on the market. A bargain while they last at $11.00 each. THE R. M. CORNWELL CO., Syracuse, N Y.

FOR SALE—RUNABOUT, including top; extra plugs, etc.; $275, or will trade for larger car. WHITE AGENCY, 222 Pearl St., Buffalo, N. Y.

COLUMBIA Gasolene Runabout, perfect condition, best offer; will consider exchange for Orient buckboard or good Motorcycle. CHAS. L. FAWCETT, Oberlin, Kans.

FOR SALE, OR WILL EXCHANGE FOR A 1904 OLDS RUNABOUT, a 1904 touring car with adjustable tonneau; shifting canopy top with curtains; twin vertical motors, underhood; sliding gear 3 forward and reverse. All in best condition. Address ES-BE-ELI, Akron, O.

WE have the following which we would like to sell together or separately. We will put a price on this stock that will be very attractive.

One two-seated Steam Automobile. The front seat closes and makes a nice appearing front. Has been run about 100 miles.
7 Boilers (new) 17 and 19 inch, with copper flues.
12 Boiler Shells.
5 Steam Engines, without Jackets or Pumps.
2 Engines, with Jackets.
12 Oil Pumps, Carter Automatic.
2400 Copper Tubes, ½ inch x 16½ inch.
30 Air Tanks, Copper, 7 x 30.

ONE CAUSE OF LOST POWER

Improper Adjustment of the Tappet Results in Attenuated and Inefficient Spark.

A loss of power in a low tension system magneto fired engine may often be traced to the tappet giving the "tweaker," as it is called, too much of a "tweak." The tappet lifter, which causes the electric circuit to be broken inside the cylinder, has a definite lift, but as the tweaker is not directly connected to it, the spark may be adjusted in a manner analogous to the setting of the sparking plug points. This is done by screwing the threaded end of the tappet rod into or out of, as the case may be, the internally screwed lifter, which is directly acted upon by the cam. The adjustment should be such that the tweaker makes a rapid jump from the insulated point, but the arc formed should not be too long, otherwise an attenuated spark is produced, which has poor ignition qualities. On the other hand, if a short, quick break is given, a fine, fat, hot spark results, and the engine pulls double the power.

Now to adjust the tappet to produce the latter result, the engine should be turned round with the starting handle until the tappet lifter is at its highest point. Then screw down the tappet rod until there is a distance of about four millimetres between the underside of the tappet head and the tweaker. Next turn the engine until the tappet falls and hits the tweaker; this should be just before the tappet reaches its lowest point, at which it should be possible to pull the tweaker down a lot with the fingers. If a cylinder is found to be firing badly and not pulling as well as its companions, if of the multi-cylinder type, slack off the pinching screw at the head of the tappet lifter and screw up the tappet one turn; the correct movement is counter clockwise. If no better results follow, continue screwing up until nothing happens, and then start screwing down by one complete turn, for three turns, and then by half turns until the correct spark is obtained.

This, of course, entails a lot of starting up of the engine, but, once found, no further adjustment should be necessary for a long period.

Heated Shafts Need Prompt Attention.

The symptoms which indicate the tightening of the piston in the cylinder as a precursor to seizing always proclaim themselves unmistakably. On hearing a shrill creaking from the mechanism it is evidently best to stop and ascertain the cause, and by touching the various bearings the one which is heating is quickly found. An abundance of lubrication, and, while waiting an opportunity to dismount the bearing for inspection, slight loosening of the bushes are the steps to be adopted.

When a shaft heats to an abnormal extent it is better to dismount it on the first available occasion to find out its condition. Should it be found scored with traces of seizing, polishing by means of a lathe should be resorted to, or, in the absence of a lathe, by fine emery cloth, about No. 1 or No. 0. Should the bushes also be marked, they should be lightly rubbed with a very fine semi-circular file, and afterward polished with emery cloth.

Brakes Make Skidding Worse.

When the car skids, remember that putting on the brakes hard will make matters worse. About the only thing which can be done is to take out the clutch, keep the brakes gently on and steer the front of the vehicle in the same direction as the back tends to go. When driving a car fast on a slippery road it is best to drive close to the curb. Then, if one wants to stop suddenly, the front wheels should be turned slightly away from the curb and the brake applied. The back wheels will then slide against the curb, and cannot, of course, skid any further.

Heat Hurts Batteries and Coils.

Dry batteries and induction coils should be kept as far as possible from heat. The cement used in sealing dry batteries melts rather easily, and if this is permitted mysterious troubles may result. In the case of the induction coil, the paraffine wax frequently used for insulation is very apt to melt and run out, and will not only leave the coil in bad condition, but will, if it gets on the vibrator or on any of the contact surfaces, interrupt the flow of electricity and so stop the motor.

Easy Starts Spare the Gears.

The low speed gear should invariably be used when starting the car, as this saves both the clutch and the transmission. Cars having powerful motors may be started on the third speed, but this does not do the vehicle any good and may do it a great deal of harm. A practice which should be avoided as much as possible, and which is responsible for many broken gears, chains and twisted shafts, is that of "racing" the motor before the car is started and then dropping the clutch in.

To Test Platinum Points.

When misfiring is persistent, do not think of your "platinum" points as Cæsar wished to think of his wife. Alloy creeps insidiously into everything one hammers or eats, into every crevice of food and manufacture, and why should those tiny contacts escape? Very likely they are not platinum at all, but are as plated as your tablespoons. Touch it with sulphuric acid; if it turns color it is German silver. Get at it with a punch and rivet in a bit of the right stuff.

Declutch on Passing Rough Places.

When about to pass over holes in the road or short patches of loose stones, the car should have sufficient momentum to carry it over such rough places so as to allow the clutch to be disengaged. This prevents racking the mechanism.

WHEN THE SHAFT BINDS

Temporary Repairs Can be Made With a Big Wrench—Lathe Work Necessary Ultimately.

Bent shafts can only be produced by a violent shock or collision. A strong steel wrench a foot or fourteen inches in length will not only serve for the large nuts of the motor wheels, but will be useful should a shaft get out of alignment.

The method of employing it is simple, and needs no lengthened description; merely seize the part adjoining the bend between the jaws of the wrench and act on the latter gently till the shaft is brought back to line. Should the bent shaft have any great length of overhang it will be found advisable to hold it with another wrench or lever on the other side of the bend, so that the effects of the first may not be felt beyond the point to be straightened. Sometimes it will be found preferable to dismount the shaft for the purpose of straightening, but on no account must a hammer be used for the purpose. Such a proceeding involves risk of breakage, or at least further deterioration of the shaft.

When it is possible the shaft should be straightened on a lathe by a competent mechanic, because, of course, by the proceeding specified above it is not possible to attain the necessary perfection.

Dark Room Tests for Short Circuits.

Sometimes "shorting" is not easily discovered, but it cannot escape the careful investigator for long. If the terminals and every inch of every wire are examined, and it is seen that the insulation is perfect and that not even a single strand from any naked end is inviting the current to escape by a short cut, there can be no short circuiting. Or so it would seem.

But it is sometimes difficult to decide by appearance alone whether the insulation, especially that inclosing the secondary wire, is perfect or not. The best method of discovering a short circuiting is to take your machine into a darkened room and set it slowly in motion on the stand. It is hardly likely there will be any permanent contact anywhere—in which case no light would be visible—but some intermitting spark will indicate the whereabouts of the leak.

Temporary Repairs for Broken Pipes.

A metal pipe, if broken off, can be temporarily repaired by connecting the broken ends with rubber tubing or hose of the right size and binding the ends tightly with wire or twine. A mere leak may be stopped with tape, if small, or with a piece of patching rubber held down by tape, if larger. In making use of rubber cement, patching rubber, tire tape, rubber tubing or anything made of or containing rubber in any form, bear in mind that rubber is soluble in gasolene and will not hold it long.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

Side Movement of Tires.

Whether owing to wrong construction in cross section or insufficient air pressure, the more a tire sways or rolls on the rim the greater the tendency to side slip; for if the tire is of such a section that when in use it is rigid enough to withstand a severe lateral strain—that is, to check the car in the initial stages of a side movement by causing immediate friction on the road, without allowing the car to roll sideways on the tire—it will more often than not stop any serious side movement, which increases in power as the weight of the car gathers momentum sideways, and which frequently becomes so great that the back of a car in swaying sideways drags the front wheels round and prevents any possibility of steering the vehicle.

To Preserve the Cylinder.

If a valve or the porcelain in a sparking plug breaks, care should be taken to ascertain whether any of the pieces have lodged in the cylinder. If so, they should be removed before attempting to run the motor, as it does not take a piece of steel or a few chips of hard porcelain a very long time to so cut a cylinder that it must be renewed. As a rule, cylinder walls are not of sufficient thickness to permit reboring if it is necessary to take off more than the merest suspicion of a cut, and a few chips caught by the piston can make fairly deep grooves the entire length of the stroke.

Popular Wedding Trip.

A popular wedding trip is to take a D. & C. steamer to Mackinac Island.

If you want a delightful wedding trip, where you are not likely to meet acquaintances, take one of the new D. & C. steel steamers to the island of cool breezes. Staterooms and parlors reserved 30 days in advance. Send 2c. for illustrated pamphlet.

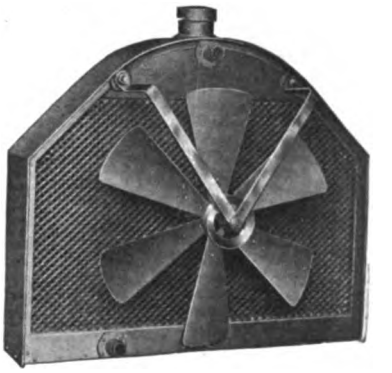
A Sharp Eye Ahead!

EYE-FIX TRADE MARK

THE GREAT EYE REMEDY

Driving an auto will be more of a pleasure and less of a strain on the eyes if you use EYE-FIX. This tried and true remedy strengthens weak eyes, cures watery eyes and allays irritation caused by wind and cold. It is an effective tonic for eyes that are dull, tired or overtaxed—makes them bright and clear—removes the aches and pains. Quickly cures sore eyes and instantly soothes eyes that are injured by particles of dust, etc. Carry EYE-FIX in your pocket, a small vial and a dropper in a neat case. Use it in a jiffy—two drops is a dose. All druggists and opticians sell EYE-FIX at **50c.**

Every dealer in automobiles and sundries should have EYE-FIX in stock. He will find a good sale for it among his patrons.



Inquiries cheerfully answered, and we send a trial bottle, post-paid, for 10c.

EYE-FIX REMEDY CO.,

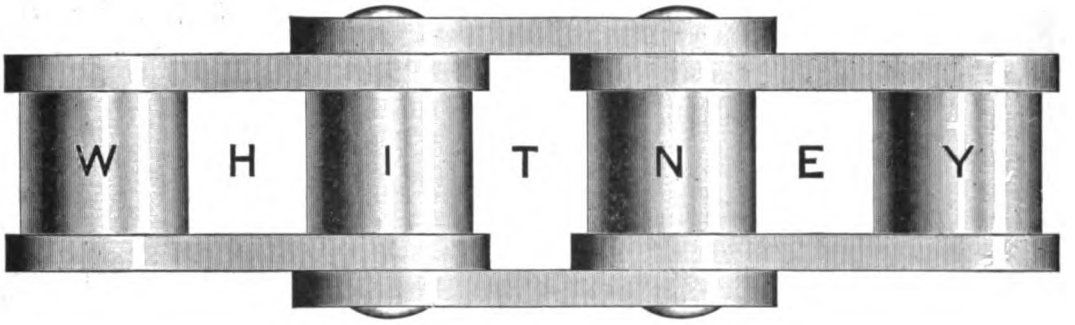
Dept. S., Detroit, Mich., U. S. A.

WHITLOCK COOLERS

For 1905.

Experiments are Expensive.

Sometimes they are not only expensive, but fatal. This is especially true in motor car construction. It is, therefore, always on the side of safety and good judgment to adopt those parts which have stood the test of time and have acquired for themselves a reputation based upon actual merit Price is not always the most important consideration.



Therefore, in deciding what cooler you will use for 1905, select one with a reputation.

The Whitlock Cooler has stood the test of time. It has been used for two seasons by the majority of American builders of touring cars. Our experience in this line is now unequalled. Write us about your cooler proposition.

Oldsmobile

The Best the Field Affords

By Reason of

1—Oldsmobile motor—ripe product of over twenty years successful experience.

2—Simplicity of mechanical construction. The absence of all gaskets. Cylinders and cylinder heads cast integral. Bearings self-oiling; cam shaft gearing entirely encased.

3—Easy to start—absolute impossibility of "kicking back" in starting.

4—Style, comfort, power, plenty of speed.

5—Light Tonneau Car equipped with tilting steering post, divided front seat, honey-comb radiator, etc.

On the recent Automobile Tour—from New York to St. Louis—the Oldsmobile Tonneau Car easily held its own with cars costing from three to fifteen times as much. It maintained an average speed of twenty miles an hour over the entire trip.

Oldsmobile Standard Runabout, $650.00; Oldsmobile Touring Runabout, $750.00; Oldsmobile Light Tonneau Car, $950.00.

THE CADILLAC WINS

races and hill-climbing contests so often, we have come to regard its winning as a matter of fact, and, as "we do not make a racing machine," we rarely advertise its winnings. If any make of machine selling at less than twice its price, and rated at twice its horse-power, succeeds in defeating it, the owner and maker are justly proud of the performance, and as a rule it is well advertised by both. To all of which we offer no objection.

AT DEL MONTE, CALIFORNIA

on August 26th and 27th, there was some racing, in which Mr. Lee and the Cadillac indulged, and while they did not win *all* the races, the following telegram and letter will give you some idea of what they *did do:*

DEL MONTE, August 27th, 1904.

"I entered four new Cadillacs to-day's races. Result: Race for ten horse and under, *Cadillac First and Second.* Race for cars $1,500 and under, carrying 600 pounds, Cadillac Second. Race for 10 to 16 H. P., *Cadillac First and Second,* this in two heats, Cadillac winning each. Two Cadillacs in final ran 5 miles, never 12 feet apart. Race pursuit, for cars $1,000 and under, three Cadillacs going when rest out at 10 miles. Won seven cups."

4:25 A. M. (Signed) CUYLER LEE.

UNDER DATE OF SEPT. 27, 1904

Mr. Lee writes as follows:

SAN FRANCISCO, CAL., Sept. 27th, 1904.

Cadillac Automobile Co.,
1343 Cass Avenue, Detroit, Mich.

GENTLEMEN:—

"We notice in the 'Motor Age' that the Rambler Company advertised the races they won at Del Monte. They refer, in this advertisement, to the second race on the first day for touring cars $1,500 and under, and show in the 'ad' a Cadillac, entered by myself, coming in second. They do not mention anything about the fourth race on the same day for gasoline cars 10 to 16 H. P., in which they entered three double-cylinder 16 H. P. Ramblers against two Cadillacs. In the first heat, two Ramblers and a Cadillac raced, the Cadillac winning. The second heat, one Rambler and a Cadillac raced, the Cadillac winning. The two Cadillacs then raced against each other for first honors."

Yours very truly,
CUYLER LEE.

When all is told, you may be pretty certain that Cadillacs are rarely defeated by cars of equal price or power. To beat a Cadillac is the ambition of most makers.

Full particulars and catalogue for the asking.

FORD MOTOR CO., Detroit, Mich.

In this, our first "Auto-talk" to the readers of Motor World, we do not intend to discuss speed, control or any of the technicalities of automobiling.

What we do want to talk about this time is *value.*

A sensible man doesn't want to pay any more for a thing than it is worth—he wants a thing to be worth all he pays for it.

He doesn't want to pay a big price just because the maker thinks he can get that price, and he doesn't want to be told that a machine is a *good machine,* when it is really only good for the money.

Naturally he asks "Why cannot the automobile business be put upon a solid footing of *cost* and *worth?*"

It was to answer this question that we started a great automobile plant eight years ago.

And to-day we offer to the public the **Autocar**—*an automobile that is built and sold on a commercial basis*—and the only one.

The Autocar is beyond the experimental, feeling-the-way stage.

It costs what it is worth—it's worth what it costs.

Every part from motor to minutest detail of mechanism is built upon lines that have been demonstrated by test and practice to be correct.

The Autocar has all the features of comfort, convenience and safety found in the highest priced car. Every part is instantly accessible. It is built throughout in the best manner of the best materials and finished in the finest possible style.

The Autocar has a speed of from 3 to 35 miles an hour. Extreme ease of control is attained through an unusually simple arrangement of levers.

The price of the Autocar touring car shown above is $1700—the Autocar runabout $900.

In our next month's talk we will give you more details of the Autocar's construction and performance. In the mean time we ask you to send for our booklet, in which are found addresses of our dealers throughout the country. There is one near you.

One thing is certain, you cannot afford to buy an automobile without investigating the Autocar.

WINTON

POLICY FOR 1905.

Sales Agents from many sections of the automobile world have asked us during the past week what we would have ready for the early 1905 market. The extent and character of these inquiries afford us a great deal of satisfaction, for we realize that much is expected from the house of WINTON, and certain we are that the very highest expectations of our Sales Agents will be gratified.

Our inquirers wish to know whether we will manufacture one model, two models or three models. They ask if we will build double or four cylinder cars, or both. And if we build four cylinder cars exclusively will we have a sufficient number of models, affording the necessary range in price so that Sales Agents will not be compelled to represent several manufacturers in order to have a complete line of gasoline cars.

And they want to know also if we will build vertical or horizontal motors. They ask if it is a fact that Mr. Winton has solved the problem of a practical vertical four cylinder motor, which will at once embody the important advantages of our horizontal construction and eliminate the disadvantages of inaccessibility, improper lubrication and ignition and the great complication of parts, which are the common faults of the vertical motors that have gone upon the market to date.

Some Sale Agents have asked if it is not true that we have developed and will employ a practical and sure ignition system which eliminates batteries and the ever-bothersome multiple spark vibrator coils.

Then again we are asked whether a positive automatic oiling system, which will be equally efficient in all temperatures, and with which we have done some extensive experimenting during the past year, will not be a feature of WINTON 1905 construction.

Of course, there is no secret about our direct drive, side entrance tonneau, improved carburetor, etc.

Without answering each of these queries specifically at this time, because we shall reserve the details of WINTON 1905 features for a separate announcement, we can say without any reservation whatever that our 1905 models will more completely represent the wants of the buying public than any line of automobiles ever before put upon the market. Just watch this space—or, better still, get into communication at once with our Sales Department.

And now permit this line of advice: Avoid stepping on "live wires." Wait until you know what we are going to offer before making definite promises to any manufacturer.

Unique and Unparalleled

Performance of the Pathfinder

ELMORE

The history of automobiling in America records no more sensational performance than that of the Pathfinder Elmore on the recent trip from New York to St. Louis and return. An ordinary stock car was selected to map out the roads in advance of the endurance run. This tremendous trip of more than 5000 miles over villanous roads was made by the Pathfinder Elmore with a repair bill of only 25 cents, and not a single displacement. Did any car in the endurance run—whether it cost $1000 or $10000—equal this astonishing record of the $850 Elmore?

Send for catalogue and the intensely interesting little book "One Long Jump and Two Short Steps."

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

KEEPING COOL

is the problem of the motor that sets out for a continuous day and night dash from the Great Lakes to the Atlantic. Plowing across the prairies of the West, through the sandy roads along Lake Erie, and up the tortuous climbs over the Catskill Mountains, with throttle wide open and a merciless driver getting every ounce of power out of the motor, the problem is, we repeat, to

KEEP THAT MOTOR COOL!

The COLUMBIA and the WHITLOCK Coolers set up a new mark--Chicago to New York, 1,127 miles; net time 51 hours 5 minutes.

The motor was a 30-35 h.p.; the water consumed in the fifty-one hour grind was TWO QUARTS! These accomplishments are phenomenal when compared with the results gotten from other coolers.

BUT!! The COLUMBIA had cracked this record before; its makers knew the necessity of

RELIABILITY AND A COOL MOTOR

and their choice well fell to

The Whitlock Cooler.

The motor with a poor cooler will not mote. The Standard cooler for high-class cars is indisputably the WHITLOCK.

Volume IX. New York, U. S. A., Thursday, October 13, 1904. No. 3

TO TEST LICENSE LAWS

N.A.A.M. Decides to Take Action—Elects Three New Members and Sanctions Two More Shows.

Quite unexpectedly the National Association of Automobile Manufacturers, at the meeting of its executive committee, on Friday last, 7th inst., decided to undertake to prove or disprove the legality of the laws requiring numbers, licenses or registration, or whatever they may be called. Action took the form of requesting an opinion from the association's counsel, with a view of instituting a test case.

According to Manager Miles, "the particular difficulty which brought about this decision is that which makes it necessary to be provided with licenses for a number of states before attempting a tour of any length. The association is now determined to ascertain whether a license is necessary in any State, and, if so, whether a license issued by one State is not, of necessity, to be accepted by the authorities of other States."

At this meeting the representatives of the Reliance Automobile Mfg. Co., of Detroit; the Corbin Motor Vehicle Corporation, of New Britain, Conn., and the Phelps Motor Vehicle Co., of Stoneham, Mass., were admitted to membership. The Daimler Co. was reinstated, and the name of the Berg Co. was changed to the Worthington Automobile Co. The resignations of the Hyatt Roller Bearing Co. and the National Cement and Rubber Co. as associate members were accepted.

S. A. Miles, general manager, was again elected the association's representative on the committee of allotment for the New York Show.

The show committee reported that sanctions had been issued for shows at Philadelphia and Toronto, making the complete list to date as follows:

New York—J. C. Young, manager, Madison Square Garden, January 12 to 21.

Chicago—S. A. Miles, manager, 7 East Forty-second street, February 4 to 11.

Philadelphia—Philadelphia Auto. Trade Association, H. D. LeCato, manager, Girard Building, January 23 to 28.

Detroit—Tri-State Sportsmen's and Automobile Association, Seneca G. Lewis, manager, February 13 to 18.

Toronto—Toronto Automobile Club, W. J. Morgan, United States representative, Press Club, New York, February 27 to March 4.

Boston—Boston Automobile Dealers' Association, Chester I. Campbell, manager, 5 Park Square, March 4 to 18.

Washington—Washington Automobile Dealers' Association, B. C. Washington, Jr., manager, March 27 to April 5.

Gets Money to Further Plans.

In line with the enlarged scope of the plans of the Consolidated Manufacturing Co., of Toledo, Ohio, a mortgage was executed last week for $200,000 in favor of the Ohio Savings Bank and Trust Company. This increased working capital will be used in the extending of the business, which is expected to attain larger proportions the coming season than ever before.

Cryder Quits the Consolidated.

H. C. Cryder has resigned the presidency of the Consolidated Motor Co., of this city, and Lowell N. Palmer has been elected in his stead. The concern is making good progress in the production of its various lines, some of which are almost completed. Hereafter the Moyea touring car will be built with the Consolidated Co.'s friction drive device.

Columbus Settles With Creditors.

The Columbus Motor Vehicle Co., Columbus, Ohio, have settled their financial troubles out of court. The creditors, several of whom filed a petition in bankruptcy, have accepted the company's offer, and it is understood that it will resume business at once.

Two Rambler Surprises in Store.

The Rambler line for 1905 will incorporate two surprises—models at $2,000 and $3,000 respectively. It is understood that they will be closed or semi-closed cars, embodying something unusual in the way of luxurious appointments.

ST. LOUIS AWARDS

Jurors Complete Their Labors and Distribute Honors to the Deserving—Some Big Surprises Included in the List.

St. Louis, Oct. 10.—Although a number, if not all, of the successful exhibitors have been already notified of the findings of the Jury of Automobile Awards, it is probable that they will not be officially promulgated until the end of this week. For some reason the exposition authorities appear to wish the information withheld. It is known, however, that the awards are as follows:

Grand Prizes.

Gasolene.

Haynes-Apperson Co., Haynes cars.

George N. Pierce Co., Pierce Great Arrow car.

Pope Mfg. Co., Pope-Toledo cars.

Steam.

White S. M. Co., White cars.

Electric.

Woods Motor Vehicle Co., Woods cars.

Gold Medals.

Electric Vehicle Co., Knox Automobile Co., Packard Motor Car Co., National Motor Vehicle Co. and the Rainier Co., also, in accessories, Badger Brass Mfg. Co. (Solar lamps), Veeder Mfg. Co. (Veeder odometers) and Shelby Steel Tube Co., and Hendee Mfg. Co. (Indian motorcycles) and Miami Cycle & Mfg. Co. (motor Racycles).

Silver Medals.

Olds Motor Works, Cadillac Automobile Co., T. B. Jeffery & Co., Winton Motor Carriage Co., E. R. Thomas Motor Co., Ford Motor Co., St. Louis Motor Carriage Co., Grout Bros. Co., Smith & Maltby, H. H. Franklin Mfg. Co., and, in accessories, Gray & Davis (lamps).

Bronze Medals.

Royal Motor Car Co., Waltham Mfg. Co. and Duryea Power Co., and, in accessories, the 20th Century lamps and Apple and Motsinger igniters.

In the foreign section, grand prizes were awarded Renault, Panhard, Daimler, De Dietrich and Georges-Richard, and gold medals to Darracq and Benz.

Digitized by Google

MECHANICAL MEN MEET

License Association Brings Them Together and First Step is Taken to Band Them.

Because of the lateness of the hour and the necessity of being on the scene of the Vanderbilt Cup race early the following morning, the projected mechanical branch of the Association of Licensed Automobile Manufacturers was not formed at the meeting of that organization on Friday evening last, 7th inst. The first step in that direction was taken, however, by authorizing Colonel Charles Clifton, of the George N. Pierce Co., to appoint a committee of five to bring about the permanent formation of a mechanical branch, as had been proposed. It is expected that a meeting for the purpose will be held about November 1.

This was decided at the dinner held at the Central Park Casino, at which General Manager Day presided.

The forenoon and afternoon were devoted to what may be termed the "comparison run" to Ardsley and Travers Island. It was a well ordered affair, designed not merely to acquaint the mechanical heads one with the other, but to afford them an opportunity of exchanging ideas and comparing notes and cars. To further the plan, each participant was furnished with a card designating the successive cars in which he was to ride, and giving a key to the numbered white ribbon badges worn by each man. In this way when stops were made and "change cars" was the order of the moment, every man was able to immediately identify every other man, and to call him by name. All were given opportunities to ride in each other's cars, of which eighteen were in evidence. Of the number but three were 1905 models—those of the Electric Vehicle Co., the E. R. Thomas Motor Co. and the George N. Pierce Co.

Those who participated were: E. O. Pollard, superintendent, and A. P. Brush, engineer, Cadillac Automobile Co.; Howard Coffin, engineer, Olds Motor Works; T. C. Collings, superintendent, Peerless Motor Car Co.; J. Frank Duryea, engineer, J. Stevens Arms and Tool Co.; Herman G. Farr, secretary and superintendent, and Harry A. Knox, vice-president and general manager, Knox Automobile Co.; D. Ferguson, engineer, and Henry May, vice-president and general manager, George N. Pierce Co.; L. B. Gaylor, general manager, and J. C. Robbins, engineer, Waltham Mfg. Co.; N. T. Harrington, engineer, and Charles B. Wilson, superintendent, Olds Motor Works; Elwood Haynes, vice-president and general manager, and Richard Wiley, superintendent, Haynes-Apperson Co.; J. P. Howe, designer; Karl Almquist, chief draughtsman; H. R. Worthington, secretary, and W. J. P. Moore, vice-president, Worthington Automobile Co.; C. B. King, superintendent, Northern Mfg. Co.; L. H. Kittredge, treasurer and general manager, Peerless Motor Car Co.; Hiram P. Maxim, chief engineer, and George W. Wesley, superintendent, Electric Vehicle Co.; Harry G. McComb, mechanical engineer, and John C. Spiers, general manager, the Autocar Co.; F. P. Nehrbas, assistant superintendent, and E. R. Thomas, president, E. R. Thomas Motor Co.; W. M. Remington, assistant engineer, J. Stevens Arms and Tool Co.; Eugene F. Russell, superintendent, Locomobile Company of America; B. W. Snow, superintendent, and John Wilkinson, engineer, H. H. Franklin Mfg. Co.; Henry Souther, mechanical engineer, Locomobile Company of America; J. G. Utz, engineer, and William Van Wagoner, general superintendent, Kirk Mfg. Co.; S. D. Waldron, sales manager, Packard Motor Car Co.; R. M. Beck, chief engineer, and Harold Pope, engineer, Pope Mfg. Co.; T. W. Goodridge, manager, Studebaker Automobile Co., and George H. Day, general manager, A. L. A. M. and K. F. Cuntz, patent attorney, A. L. A. M.

All of the cars employed were distinctly on their "good behavior." On their arrival at the Casino in the evening, it was found that five punctures constituted the sum total of the day's troubles and delays.

Packard Now on Broadway.

The New York branch of the Packard Motor Car Co. has been removed to No. 1,542 Broadway, near Forty-sixth street, and fronting the asphalted expanse of Long Acre Square. It will afford more room and conveniences than the old place on Fifty-ninth street.

Koehler Adds Another Store.

Including the main one at No. 845 Broad street, the H. J. Koehler Sporting Goods Co., Newark, N. J., now maintains four stores, the most recent establishment having been opened at Nos. 141 and 143 Halsey street, in that city. The third store is in East Orange, and the fourth in Montclair.

Krotz Has New Cushion Tire.

The Krotz Mfg. Co., Springfield, Ohio, the head of which is also connected with the Kelly-Springfield Tire Co., will build a limited number of electric cars for next season's trade. Incidentally, Mr. Krotz has recently perfected a cushion tire which probably will be heard from later.

Body Builders Increase Capital.

An increase of capital from $30,000 to $50,000 has been made by the Pontiac Body Co., of Pontiac, Mich., which will make additions to its plant. Hereafter automobile bodies will be manufactured exclusively.

Clark Buys Out Beach.

John D. Clark has purchased the interest of E. A. Beach in the firm of Clark & Beach, 1404 Meridian street, Anderson, Ind., and will continue the business in his own name. A specialty of automobile repairing is made.

ELECTED ELEVEN NEW MEMBERS

Accessory Association Expanding at a Great Rate—Its Show Committee is Named.

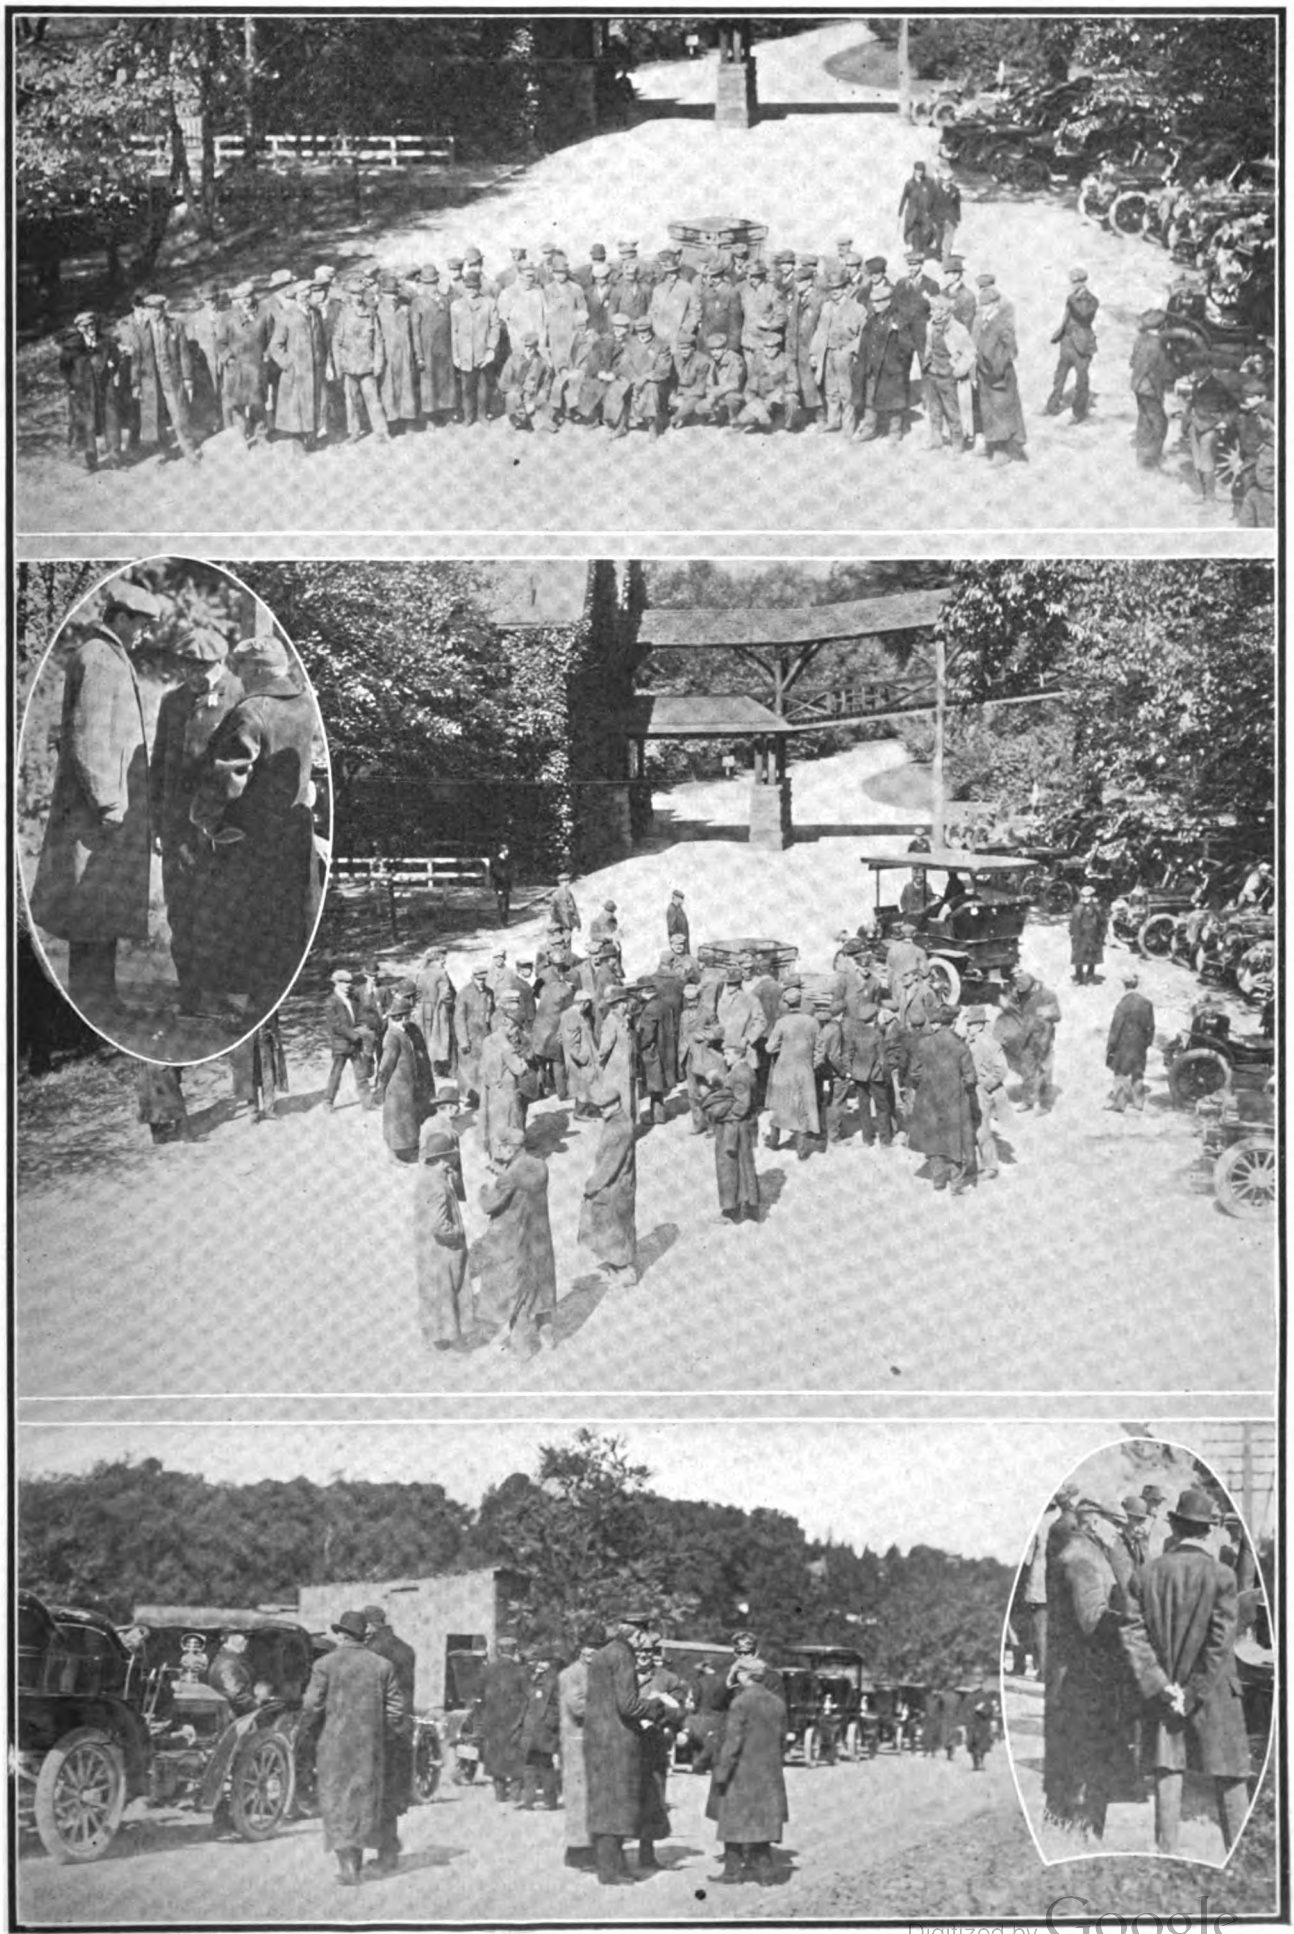
What one of those who attended described as "the best meeting we have ever held" was that of the executive committee of The Motor and Accessory Manufacturers in New York on Thursday last, 6th inst. Practically every member of the committee was present, and all seemed animated by the "do something" spirit that has possessed the organization since it was formed.

Eleven new members were elected, but that the Manufacturers are not falling over themselves in the desire to boost a lengthy roll was indicated by the holding over for further investigation of several other applications. Similarly, the expulsion or dropping from the rolls of two members for failure to pay their dues showed that no "dead wood" is being carried.

At the meeting the appointment of the show committee was announced, as follows: Chairman, D. J. Post, of the Veeder Manufacturing Co., Hartford Conn.; H. O. Smith, of the G & J Tire Company, Indianapolis; F. E. Castle, of Gray & Davis, Amesbury, Mass.; H. W. Chapin, of the Brown-Lipe Gear Company, and H. T. Dunn, of the Fisk Rubber Co.

The prospectus and plans of both shows will be forwarded to the members of the organization, and the committee will allot the 10,000 feet of space reserved at the New York show for the Motor and Accessory Manufacturers. Application for space for the New York show will close on October 28, at noon, and for Chicago on November 1.

The new members elected were as follows: Federal Manufacturing Co., Elyria, Ohio; Parish & Bingham Co., Cleveland; Dow Portable Electric Co., Braintree, Mass.; Gray Pump & Register Co., Rochester; Auto Coil Company, Jersey City, N. J.; Warner Instrument Co., Beloit, Wis.; Continental Rubber Works, Erie, Pa.; F. E. Wadsworth, Detroit, Mich.; Manufacturers' Foundry Co., Waterbury, Conn.; Carlisle-Johnson Machinery Co., Hartford, Conn., and the Webb Company, New York City.



On Saturday the officers occupied a box in the grandstand at the Vanderbilt Cup race.

Century Creditors Will Meet Once More.

A meeting of the creditors of the Century Motor Vehicle Co., of Syracuse, N. Y., will be held in that city on October 17, at which time the concern is expected to be finally wound up. The meeting is called for the purpose of passing upon the final report and account of the trustee, the declaration of a final dividend, making such allowances for expenses and attorneys' fees as to the court may seem proper, and the discharge of the trustees from the performance of all further duties.

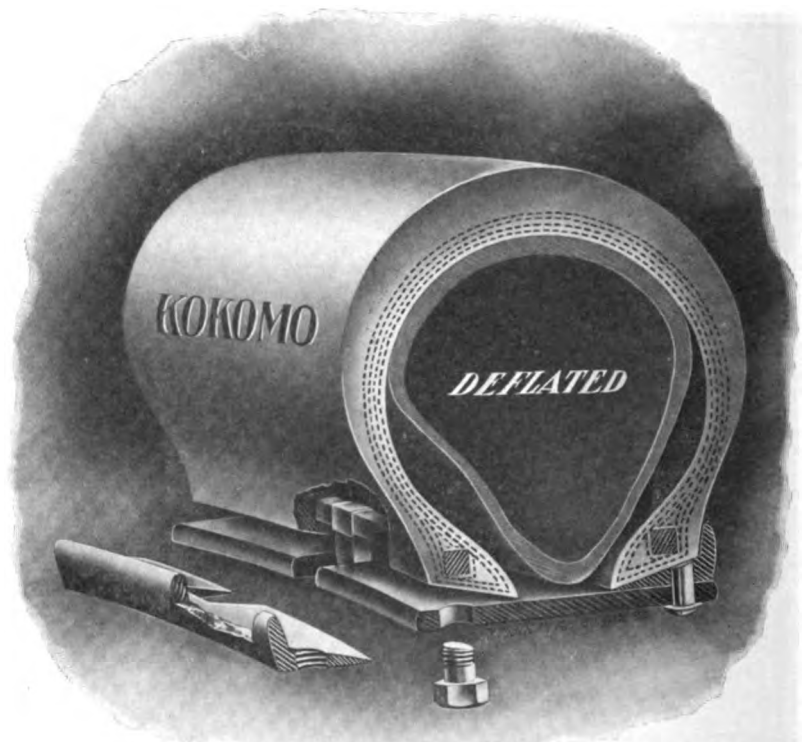
NOT LIKE OTHER TIRES

Notable Production of a Notable Concern—Many Ingenious Ideas Brought Into Use.

Quite the most notable development in tires that has made its appearance in some time was launched last week by the Kokomo Rubber Co., of Kokomo, Ind., who in themselves constitute a notable addition to the automobile industry. For many years they have stood high as makers of bicycle and carriage tires, their record being one of uninterrupted prosperity and growth, and their reputation that of sound and conscientious manufacturers. For at least three years they have been wrestling with the automobile tire problem, and it is in line with their record and repute that they did not go off half cocked and announced their tire only when thorough test had proved it right and worthy of their name.



Although among the pioneer makers of single-tube bicycle tires, they early came to the conclusion, which all tire makers and users of these tires have since come to, that the problem was not solved, and that the single tube tire would not prove satisfactory. They say that they have watched and experimented with the clincher, and that, while that type of tire seems to be the most feasible tire in general use, they are just as fully convinced that the clincher will have to give way to something simpler and more practical in the way of a mechanically fastened tire.

With this in mind, they have long been experimenting, and for the last year have been testing the mechanically fastened tire they now offer to the public, and which is well shown by the accompanying illustrations. It is a tire that can be put on or taken off the rim in the simplest and quickest possible manner, and with the use of but one tool, a small wrench.

As the cuts make plain, the tire is easily slipped on to a plain flat metal rim or band, and is held securely not merely by the retaining flange but also by metal bands which are imbedded in the lips, or lower parts of the tire; these metal bands have lugs welded to them, which extend down through slots in the plain metal rim or band, and these lugs prevent the creeping so fatal to all tires.

In the Kokomo the inner tube is first put into the casing, inflated and adjusted to its proper place, and does not, like other makes, have to be tucked into the tire deflated, after the casing has first been put on the rim and then inflated, which causes it to be stretched in some places and crimped in others, which is dangerous to the tube, and which is a great drawback. The multiplicity of lugs projecting through the rim and tire casing, and which frequently endanger the inner tube, is also avoided by the Kokomo form of construction, which is such that "creeping" is absolutely impossible; it permits the use of a rubber valve stem and obviates the metal valve, which in many tires is depended on to check "creeping," and which is often torn from the tube by the great strain to which it is subjected.

The substantial dimensions of the "lips" and side walls of the casing, and the great sectional diameter of the tire are other characteristics to which the Kokomo people point with pride. They claim, indeed, that their method of fastening gives more cushion or air space than any tire ever devised, the resulting sectional diameter being such that it is possible to use a smaller Kokomo tire and obtain the same results afforded by other tires of larger diameter—an item that is of considerable present concern to automobile makers as contributing to the lessening of costs.

Duerr to Go It Alone.

C. A. Duerr, of the Duerr-Ward Co., New York agents for the Royal car, has purchased the interests of his partner and will continue the business at the present address, Fifty-eighth street and Broadway. The name of the concern will be changed, but the new style has not yet been settled.

M. Eugene Blin, of the French automobile manufacturing firm of Malicet & Blin, Aubervilliers, is now in this country. He will place contracts here for machine tools which will represent an expenditure of some $60,000. At the present time he is in St. Louis.

LOZIER CARS ALMOST READY

Big Marine Motor Concern, After Months of Experiment, Enters Sister Field.

It is no secret that the big Lozier Motor Co., of Plattsburgh, N. Y., have been at work on a motor car. More than a year ago the Motor World exclusively announced the fact and predicted that when it finally was placed on the market it would be an automobile worth seeing.

The prediction then made seems in a fair way to be borne out, for after an expenditure of over $30,000 and twenty-one months' effort the company are at last satisfied that they have developed a car that has no superior, either at home or abroad.

Coming from other sources such a statement might well be received with smiles, but with the past record, experience and immense resources of the Lozier people,and last, but by no means least, the fact that the car is the creation of George A. Burwell, designer of the well known Lozier marine motor, and the man who made the Cleveland bicycle, places the matter in a far different light. Then, too, as an indication of the quality to be expected, comes the announcement that despite the facilities of the big plant, but twenty-five machines will be turned out for the 1905 market, and though the list price has not been definitely decided upon, it is known that it will be not less than $5,000.

While it is yet a trifle too early to present detailed specifications of the car it is known that the motor is, of course, a four-cylinder vertical 4½ by 5½, and yielding 30 H. P. at 1000 R. P. M. and 37 H. P. at 1240 R. P. M.

Mechanically operated intake and exhaust valves, double chain drive, slide gear transmission, 36-inch wheels, an improved system of lubrication and the best and most advanced mechanical practices are everywhere incorporated in the constructional features. The entrance is by side door and the total weight of the vehicle is 2250 pounds.

Williams's Lines for 1905.

After a general tour of the West, "seeking what he might find," Frank Blaney, representing P. A. Williams, jr., the Ford man in Boston, has renewed the Ford contract for another year. He has also taken on the Marion car, made by the Marion Motor Car Co., of Indianapolis—a Western production which recently has been singularly successful in obtaining promising Eastern connections.

Searchlight at Popular Price.

The Columbus (Ohio) Brass Co. is adding a mirror-back searchlight to its line; it is small, neat and compact, and the price of it is well within what may be termed the popular figure.

Artz's Ingenious Attachable Seat.

About the neatest thing in folding seats that has yet made its appearance is that shown by the accompanying illustrations, and which is being made ready for the market by the patentee, J. D. Artz, of Dayton, Ohio. The picture shows it attached to a Ford car, but it may be also fitted to the Oldsmobile, the Cadillac, the Franklin, or, in fact, any car in which the rear portion is not otherwise occupied. The seat is of full depth and height from the floor of the car, and is full upholstered on both back and

arms; it is wide enough to accommodate two adults and a child. It is fastened rigidly to the body and cannot slip or collapse when not in use. It can be detached in two seconds, and when folded presents a very neat appearance; it may then also be used to store cushions and robes and thus protect them from dust and the weather. When desired a side door may be fitted. The seat is covered by patent No. 769,455, issued to Mr. Artz on April 15 of this year.

Gets More Room to Make Jacks.

That nothing does succeed like success is again illustrated by the Springfield automobile jack made by the Sawver Co., Springfield, Ohio. It is quite one of the neatest and most serviceable yet devised, and the fact was so generally recognized that they have removed to a larger and much better equipped plant.

IMPORTS SHOW BIG INCREASE

Value of Foreign Cars Brought to This Country Almost Doubled in Nine Months.

Figures given out last week by Appraiser Whitehead of the Port of New York show that the government's revenue from automobile imports during the first nine months of 1904 has almost doubled. Duties derived by the government from this source from January 1 to October 1 of the present year amounted to about $720,000. This is about twice as much as was received during the same period last year.

The number of automobiles entered at this port during the first nine months of this year was 427. These machines did not include any entered in bond or for special purposes, but only those on which duty was collectable. The total valuation of the automobiles was $1,600,000, and the rate of duty was 45 per cent ad valorem.

It will be seen that the average value of the 427 cars brought into this country was $3,749. With the 45 per cent duty, freight charges, etc., added, this means that the cars stood the importers about $7,500 apiece.

The Week's Incorporations.

Elmira, N. Y.—Chemung Automobile Co., under New York laws, with $5,000 capital; to deal in automobiles.

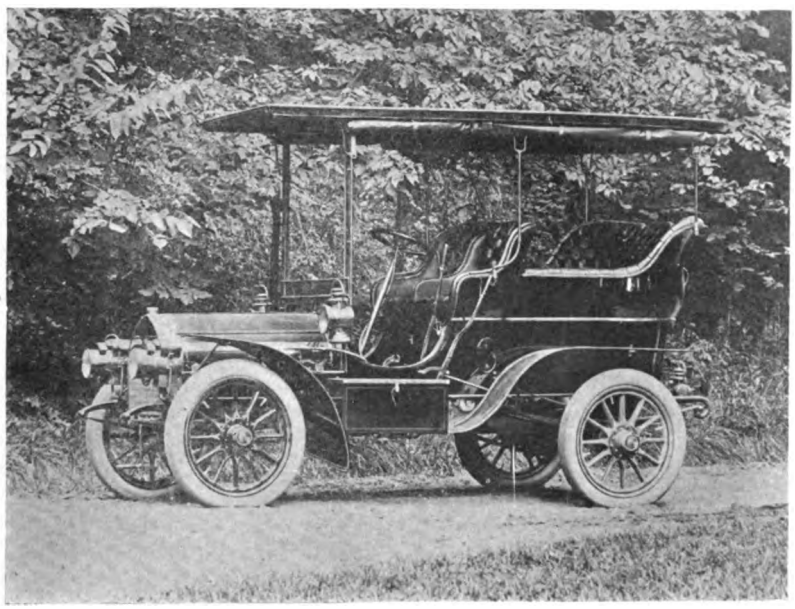
Wilmington, Del.—Delaware Auto Storage & Repair Co., under Delaware laws, with $25,000 capital, to buy, sell, repair and deal in automobiles and motorcycles.

Pittsburg, Pa.—Hiland Automobile Co., under Pennsylvania laws, with $10,000 capital. Directors—John A. Hawkins, George A. Urling and Frank W. Anderson, Pittsburg.

Brooklyn, N. Y.—Automobile Supply Mfg. Co., under New York laws, with $15,000 capital. Directors—Salvatore Salvine, New York; Errico Pascucci and Louis Rubes, Brooklyn.

Bellefontaine, Ohio.—The Zent Automobile Mfg. Co., under Ohio laws, with $25,000 capital. Incorporators: S. W. Zent, C. E. Yoder, Joseph J. Hantgen, W. W. Osborn, John P. Aikin, Nevin W. Smith and W. R. Cordray.

Mishawaka, Ind.—Simplex Motor Car Co., under Indiana laws, with $100,000 capital, to manufacture automobiles. Officers: D. A. Shaw, president; E. J. Gulick, secretary and general manager; J. W. Fuller, treasurer; R. E. Kamm, vice-president.



Pittsfield, Mass.—The Berkshire Automobile Co., under Massachusetts laws, with $15,000 capital, to manufacture automobiles. Officers: President, Dr. W. J. Mercer, Frank V. Wyland, vice-president; F. A. Cooley, clerk and treasurer, and Clarence P. Hollister, superintendent. Mr. Cooley will also be the general manager.

Olds May Open in New York.

It is within the realm of probability that the Olds Motor Works will establish a branch in New York City. The matter is being seriously considered, and a decision will be reached before snowfly.

NEW YORK, OCTOBER 13, 1904.

The Yelps of the "Yellows."

In many respects, the result of the Vanderbilt cup race was the bitterest pill the "yellow" press of New York has had to swallow in quite some time. For weeks they had screeched "Outrage," had talked in heroic headlines of "The Race with Death," and screamed "Stop It!" Their sketch artists worked overtime to produce lurid pictures of "red devils" scattering death and destruction on all sides, and the net result was the opposition of a corporal's guard of farmers that faded away the moment it came in contact with cool reason, and an injunction that dissolved the instant it met the dispassionate eye of the court.

The "yellows," and a few not so yellow, have not yet ceased their snarling, but men whose minds are not inflamed by prejudice or passion, can afford now to view the situation with equanimity. There was no carnival either of death or destruction. Of the thousands who viewed the contest, and who roamed over the course at will, not one sustained so much as the scratch of a little finger. Not one horse is known to have so much as pricked up its ears; not a dog or a hen but that remains safe and sound. In the one accident that occurred, the contestants only suffered, and never was there a form of sport in wihch contesants have not occasionally suffered. There is an element of danger in all forms of competition. It cannot be eradicated, and those who enter into such rivalries know it, and manlike, take the small risks that are involved. The ordinary walks—and rides—of life are fuller of dangers and daily claim very many more victims.

The race for the Vanderbilt trophy served to prove that in the hands of experts the motor car, at even the highest speed, is as safe, if not safer, than the street car or railway train. It brought out conspicuously the superb manageability of the car not less than the superb skill, courage and endurance of the men. It demonstrated that when properly warned, and with eyes fully opened, the public knows how to "lookout" and take care of itself.

We do not mean to imply that indiscriminate races on the public road are to be encouraged. Such a state of affairs would be regrettable, but we do not think it is much to be feared. But there is room for one or more properly organized and safeguarded contests, such as the Vanderbilt race, and the men who maintain that they are of no value overlook the well known and undoubted fact that competition or racing of whatever sort has not failed to distinctly improve the breed or kind or species of the animal, fowl or article engaged in it. Horse racing has given the world better horses. Bicycle racing has given the world better bicycles. Automobile racing has given at least the older half of the world better automobiles. And as for speed—all the world and his wife loves it, "yellow" editors and hypocritical preachers and lawmakers not excepted. As one of the soberer public prints put it when the hue and cry against the race was at its height, "although the farmer may be fearful, and his temper may be inflamed, human nature is human nature, and his desire to see the 'gol durn things go' will be strong enough to line the fences of the farms along the route." If the Long Island farmer was numerously or rabidly opposed to the contest, it required the "search" of a yellow journal to discover it on Saturday last. There was no evidence of it to be found by the normal person.

To our mind, however, and as we have time and again suggested, racing on either road or track can be best made serve the interests of automobiling by limiting the power of the cars that may be used. Without a limit, the competition must eventually dwindle to a comparatively few "special" racing machines of abnormal power that are of no practical use and point to no practical or useful ends. They will have all races won before they are started, and there will be no inducement for the average man, however he may be fired, to engage in the sport.

The Long Delayed Fight.

From many standpoints, the decision of the National Association of Automobile Manufacturers to test the legality of the so-called registration or license laws, is quite the happiest and most important news that has emanated from any organization for some little time.

We take it that the test case will be undertaken with a view of carrying it to the highest court in the land. Short of this any result that may be achieved will be of merely local or state effect. If a New York court, for instance, should decide the tagging and numbering law to be illegal, it is certain that the precious States of Pennsylvania and Massachusetts, which "pile on the agony" in damnably un-American fashion, will not give heed to the precedent established. They would continue to impose and collect what is little short of "blood money"; it literally is the price of freedom.

The news, as announced by the manager of the N. A. A. M., would make it appear that the organization is chiefly concerned with, and will institute action in one of those States which refuses to recognize the licenses of other States, manifestly either New Jersey or Maryland. If these appearances are correct, and this is the chief point which it is hoped to have decided, the movement will not be of proper direction. It should not stop short of deciding for all time and for all places whether or no a State or a community of any sort is authorized to impose special burdens and a special tax, under whatever terms, on the private carriage of any citizen that are not imposed on the private carriages of whatever sort of all citizens. That is the real issue at stake, and no other. It is not merely that one State shall be compelled to recognize the licenses of other States.

The numbered tag is the root of all laws requiring registration and licenses. The predominant legislative idea is that the display

Digitized by Google

of a number is in the light of "safeguarding the public." If it served this purpose, small objection could ensue, provided that all vehicles were subjected to the same provision. And if the public weal is really served by the display of numbers the one sane and logical law would be that which required all vehicles, regardless of motive power, to display them. The person who is killed or injured has small choice regarding the instrument of his death or injury. It is quite as painful, possibly it is even more painful, to suffer accident or death from a horse drawn vehicle than one propelled by a motor. If the number serves police purposes and contributes to the apprehension of offenders, it appears wise and judicial to provide for the apprehension of all offenders or unfortunates. One is not more culpable than an other, and the law that says so is a lie. The laws that brand the automobilist with a number, and require him to pay for the branding, are of the sort. They prejudge him and compel him to travel, not as an honored citizen, but bearing the mark of a probable malefactor. He is singled out from his fellow man. If this does not constitute class legislation our idea of it is sadly awry. These laws are founded on prejudice or newspaper clamor, or both, and incorporate the spirit that it is better that a hundred innocent men shall suffer than that a guilty one shall escape.

If the number checked speed and assisted the police in the enforcement of the law there might be at least a shred of excuse for it. But, as when an offender is apprehended the number of his license manifestly does not slacken his speed or contribute to his arrest, it is without purpose. And as in the event of escape, the courts have held that identification by number is not sufficient or convincing, to the lay mind it would seem that the law or system falls flat between the two fences, as we remarked in dealing with the subject two weeks since.

The fallacy of such laws, or the enforcement of such laws, is well illustrated by seven cases that were recently decided by the judicial Massachusetts Highway Commission. Of seven motorists arrested for violating the speed provisions of the repulsive law that obtains in that State, three proved that their cars were not even in the locality in which their numbers were "taken" by constables bent on enforcing the laws—against motorists only.

When this proportion of errors obtains, and this proportion of innocent men can be inconvenienced and forced to prove themselves not guilty, it is high time the N. A. A. M., or some other organization which believes in equal and exact justice, should come to the rescue.

The whole numbering system is worse than a farce. It should be attacked, not at one point but at all points, or it should not be attacked at all.

Repairs and Repairers.

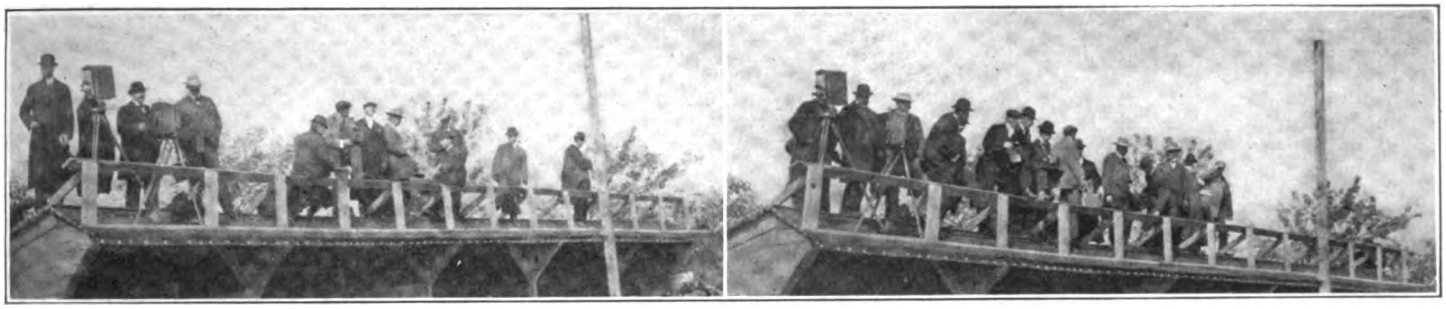
So new a business as the making and maintenance of automobiles cannot but have many annoying and disagreeable features. Naturally enough, those connected with the manufacturing end of the business are grappled with and overcome the sooner. Those connected with the maintenance of cars are of less importance, but they are not the less aggravating on that account. Nor is the owner of a car any less impotent in the case of incompetent repairing.

There are many conscientious repairers; there are also a number of skilled ones. Yet neither conscientiousness nor skill avail to put an obdurate automobile to rights when it has made up its mind to go wrong. The most skilful mechanic, one, say, who has worked for years in high class machine shops, would be at first an utter and dismal failure if put to work in an automobile repair shop and set to discover the cause of some defect in the working of the car. Frequently a man without a practical training in the machinist's trade, but with some mechanical aptitude and a knowledge of automobiles, would do much better. He would have the experience which the skilled mechanic lacked, and he would sooner or later put his finger on the seat of trouble. In other words, it is experience that counts for most, and all who would do well in the repairing business will acquire it; the sooner the better.

It is not altogether surprising, therefore, that we hear so many complaints of bad work. Repairing as a business holds out no especial attraction for the good machinist, and it is seldom that he will leave the work at which he is a past master and enter an entirely new field. But as places must be filled, the berths come into possession of men of a strata lower than that of the skilled men. The strata is composed of handy men, of ambitious men, who see in the automobile industry a field for their talents, and of rolling stones who gather no moss—not always because they are ever on the move, however.

The presence of the latter class in repair shops is productive of a great deal of the prevailing dissatisfaction. They make mistakes and they do poor and slipshod work. Thoroughness is not one of their cardinal doctrines. They sometimes effect a repair without removing the cause, and in a short time there is a recurrence of the trouble and the work has to be done over again. The owner of the car is annoyed, and believes that the workman is incompetent, and he goes away with a very poor opinion of the standard of efficiency maintained in the shop. This may well lead to a withdrawal of patronage, and ultimately to a sweeping condemnation of all repair shops.

Sometimes this is merited, sometimes not. The owner or user of the car should bear in mind, first, that the automobile is new, comparatively, and therefore more difficult to understand than it will be a few years later; second, that all intricate mechanisms are liable to develop puzzling diseases and to give trouble to even the most expert workmen.



The quick witted workman, who locates the seat of the trouble and puts it to rights in five minutes, performs wonders; and his employer would be dull witted to charge only for five minutes' work. Similarly a baffling "panne" that defies detection for hours, but is finally detected and made right with a turn of a screwdriver, is worth all the time spent on it. But the customer does not always view it in this light, and fumes at what he terms a gross overcharge.

In the automobile repair business, as in nearly all others, it is the "know how" that tells in the long run. It is to the employer's interest to have only good men in his shop, and he must eventually either train or educate the raw material he possesses or make it worth while for more expert mechanics to enter his employ. Then, and then only, will the loud and insistent complaints we now hear on every side cease to be made.

The press agent of the importers' show has "discovered" that the resolution of the N. A. A. M. dealing with outlaw shows was passed specially to injure the exhibition which he is being paid to promote. As a result, he adds that to "get even" it may be necessary for the importers to open their doors to American manufacturers.

The importers should liberally salt their hired romancer before he makes them the laughing stock of the trade. Every one else is well aware that the N. A. A. M. resolution was formulated before the importers' show was conceived, and was designed to prevent an epidemic of local shows promoted by press agents and grafters.

The Story of How George Heath, an American, won the Vanderbilt Cup for France.

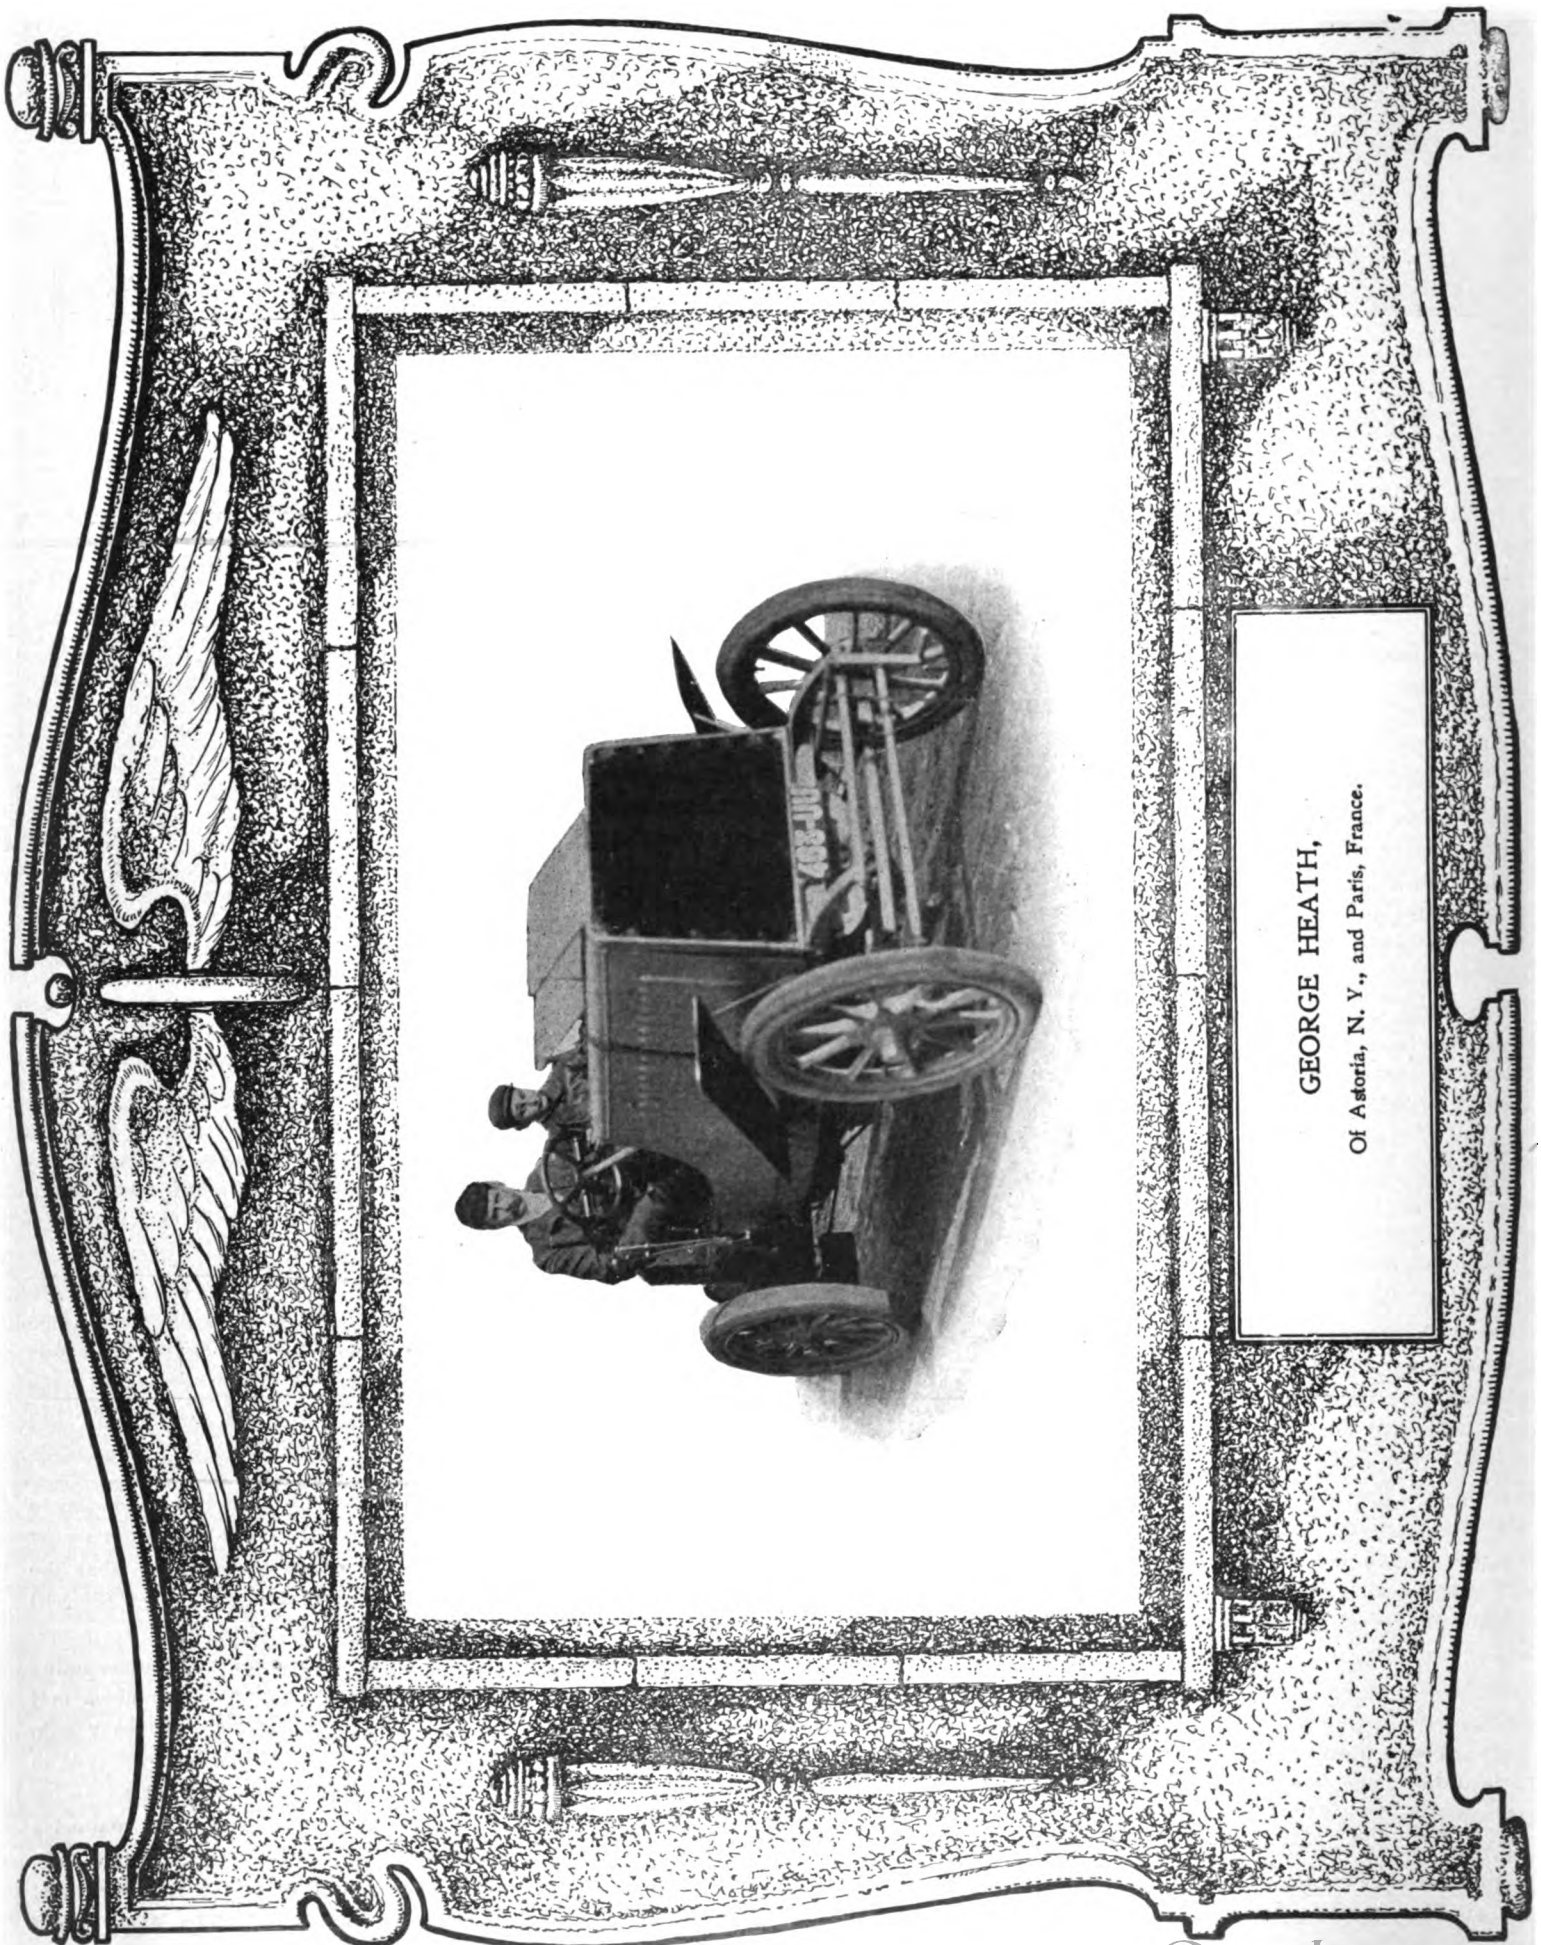
THE MAN WITH THE MEGAPHONE.

"Five killed; seven injured." This was the "score sheet," or "extra," issued and actually sold on the course during the contest by one of the "yellows" that had worked itself into a saffron frenzy and dealt in "Race with Death" scare heads previous to the race for the Vanderbilt Cup.

The "news" flabbergasted even those familiar with the workings of yellow imaginations. It seemed incomprehensible. But after the race had been run a basis for the "news" was discovered. The holes of the tripelike cooler of the winner's car were found to be filled with dozens of dead bodies, many of them held tightly to the metal breastplate by their own congealed gore, others crushed beyond hope of recognition. It was a sight to move a jellow journal to red head lines.

The slaughter of the innocents—of the poor, inoffensive, inoffending Long Island insects—was awful. They evidently had dared what the shrieking yellows themselves had failed to do—to stop the race, and, alas! they had been ruthlessly hurled into the buggish eternity without time even to hum a farewell prayer. It is assumed that a yellow reporter had found somewhere on the course the corpses of five dear little bugs and the still kicking bodies of seven injured ones, and "dreamed" one of those "dreams" of which yellow "extras" are so often made.

He is a very ignorant or uninformed or disinterested person who is not aware that George Heath, an American by birth, a Parisian by virtue of residence, and an Englishman in manner and appearance, was the bug-slaughtering individual who won the inaugural race for the W. K. Vanderbilt, Jr., Cup on Saturday last, October 8, and that he occupied 5 hrs., 26 mins. and 45 secs. in covering the 284.40 miles of Long Island roads.



Similarly, the world of intelligence must know as well that Albert Clement, of France, a Frenchman, finished second, and promptly lodged a protest, which was almost as promptly disallowed.

Only these two finished—no more. That an American in an American car did not finish third was due to no fault of his own or of his car, but to the antics of his countrymen, and, in great part, automobilists. Like a lot of thoughtless children they swarmed all over the road, and made travel so dangerous that to protect them from their own folly the officials of the race ordered it stopped. The order halted the American, Herbert H. Lyttle. When his not then esteemed fellow citizens had scattered to the four winds and made progress safe, Lyttle, for personal gratification, completed the final round of the course, and though he was neither officially checked nor officially timed, and does not so figure in the official table, he is still able to place his hand on his chest and exclaim: "I finished, any how!" The gratification was worth while, for in a 24 horsepower stock car Lyttle had given a wonderfully steady and consistent performance throughout.

The race was marred by one accident. If it is possible to extract happiness from such a lamentable occurrence, it lies in the fact that the victims were not spectators, but competitors in the race itself. Chauffeur Carl Menzel is dead, and his wealthy employer, George Arents, who drove the ill-fated car, is, after several days of unconsciousness, slowly returning to health. The best evidence makes it appear that they suffered partly because of their own excitement and zealousness. He had ridden at an awful pace for many miles with one wheel minus a tire. They also had replaced a tire, and did not secure it properly. When it burst—there is some testimony that one of its mates also burst at the same moment—they apparently performed the too common act of quickly and violently applying the brakes. A wheel collapsed, the car upset. The life was crushed out of one man; the other was quickly conveyed to a hospital with his life trembling in the balance.

While it is given to novelists to conceal to the end the keys to their stories, it is a part of newspaper ethics and practice that the text of an important news happening shall be summarized in the first few sentences. This chiefly that the man who has no liking for details—for the lights and shadows that lend human interest to an event—may gulp the bare facts and throw his newspaper to the hired man or leave it in the streetcar for the information or irritation of the conductor or street cleaning department. It is a duty which every well regulated reporter must perform, whether or not. The Motor World

HOW THE RACE WAS RUN AND WON.

The times given are those announced by megaphone at the official stand, but they are not to be accepted as final or official, any statement to the contrary notwithstanding. The official time cards and checking sheets are in the hands of expert accountants, whose work had not been completed up to this (Thursday) morning. The positions as noted constitute the order in which they passed, and without regard to their standing in point of time.

*Completed lap, but after race had been called off. Each lap, 28:40 miles.

Fastest lap—Tart, 24:04; average, 50.8 seconds per mile=70.9 miles per hour. Heath's average for total distance, 1:09 per mile=52.22 miles per hour.

reporter has performed that duty—and stretched his license in doing so. The real story—the full narrative of the race—is, if not strictly of absorbing interest, rich in color and incident.

MR. "WIFFLE" AND THE INJUNCTION.

The day before the race, and the night before it, Garden City, in the centre of the triangle and off the course itself, was the vortex. It was there that the cars were weighed and it was during the weighing that Heath, the ultimate winner, and Clement, the second man, resolutely declared that before they would submit to having their cars out of their possession overnight they would not start in the race. The unknown and unexpected rule requiring it was quickly abrogater, and that ugly wrinkle smoothed out.

It was late the night before (Thursday) that an even greater, if not wholly unanticipated hitch presented itself. A becoming gentleman appeared at the Garden City Hotel, where President Whipple, of the American Automobile Association, and all other officials and practically every one else who is anybody was stopping.

The becoming gentleman inquired for "Mr. Wiffle." It was suspected that Mr. Whipple was the man wanted. He was found and jokingly introduced to the b. g. as "Mr. Wiffle." He promptly thrust a legal looking document into "Wiffle's" hand. It proved to be an order to appear in court the following day and show cause why an injunction restraining the race should not be granted. The army of newspaper reporters that was hovering near promptly rushed for the telegraph office; it was worked overtime.

Of course, Mr. Whipple obeyed the order. The gathering in court was a notable once and included the donor of the cup which was the cause of it all. The proceedings were not protracted. The court heard the counsel of both sides and then promptly denied the injunction. He told the plaintiffs, the so-called People's Protective Association, that the law plainly authorized the authorities to grant the use of the roads for speed purposes, and

suggested that if relief was desired the legislature was the place to obtain it.

The decision of the court caused no elation or demonstration. On the part of those interested in the race it was accepted as a matter of course.

RESEMBLED A BRIDGE CRUSH.

Friday night the palatial hotel at Garden City was a sight to see. The crowd was so great that to make progress it was necessary for one to elbow his way. It suggested a Brooklyn Bridge crush during the rush hours. Millionaires, gentlemen of leisure, tradesmen and chauffeurs mingled in delightful profusion. Throughout the night motor cars and trains added to the throng. Every bed had been engaged days or weeks before, and every room contained many occupants. The hotel was compelled to suspend rules and men were permitted to sleep—if they could—in chairs. There is even a story that the barber's chair was leased for the night. Chauffeurs slept in cars that were parked in long lines, and, in many places two deep, under the trees of the hotel. The Cleveland Automobile Club "saved the lives" of a number of wayfarers. A party of the Clevelanders came on in a special coach that was run onto a side track. The men slept in the car, and as there were several berths to spare, they "took in" and provided beds and rest for several heavy-eyed rovers unable to find even a chair to sit on.

It was cold and raw and not yet daylight when the whole country was astir with automobiles and horse-drawn vehicles of every age, condition and description. The roads were alive with them. Nearly all were headed for the starting point at Westbury, and in that darkest hour, just before dawn, and in the gray of the dawn the great headlights of the motor cars seen in the far distance appeared as if hung in space, suggesting nothing so much as twin moons or suns floating close to earth. Most of the vehicles stopped at the grandstand at the starting point, near which a large American flag fluttered from a tall staff—the only semblance of decoration or embellishment in evidence. Many of the occupants of the vehicles repaired to the stand; others remained in their cars, which parked in long lines on either side of the road. Not all who came to see, however, so disposed themselves; indeed, it seemed as if the greater number preferred to remain on the road itself. Already a number of the giant racing cars were on the spot "vibrating with confined emotion." Their proximity had no effect on the crowd; if anything, each new arrival semed to draw more spectators from somewhere. The road was black with them, and the efforts of the special constables, blessed with a little brief authority, and of the race officials, were of small avail. The people opened out and formed a human lane only when the first car was making ready to start. And at that very moment a party of apparent affluence in a White steam car and which had apparently imbibed not wisely but all night, appeared on the scene. They were stopped almost on the starting line. Protests and pleadings were of no avail. They refused to budge and made as if to charge the crowd. Once it seemed as if they would run down the dapper referee, none other than W. K. Vanderbilt, jr., himself. It was then that ready hands were laid on the car, and despite the efforts of the occupants, it was rolled aside.

THE START—"GO!"

The first car, S. B. Stevens's Mercedes, driven by Campbell, throbbed and snorted like a demon tugging at its bonds. At 6 o'clock sharp the word "Go" and not a pistol

THE SCENE THE INSTANT AFTER HEATH CROSSED THE FINISH LINE.

shot slipped the leash, and it was off. A few scattered cheers greeted this, the start, of the first really great automobile race ever run in America.

Gabriel, in his long white car, got away slowly, two minutes later. He was much fancied, possibly the most fancied, certainly by the country folk, and was perhaps more warmly greeted than any of the others, which is not, however, saying a greal deal. The chill of the morning did not contribute to enthusium. Unassuming Joseph Tracy, in the American Royal, which angrily belched smoke through its four exhaust pipes protruding through the side of the hood like miniature cannon in the turret of a midget warship, received the word at 6:04. The sixth car, No. 6, the 25 horsepower Pope-Toledo, contained what undoubtedly were two human beings, but they did not look it. They were garbed entirely in black leather; even their faces were completely masked in black. They were an uncanny pair, sufficient to frighten any child out of a year's growth. They looked like devils or deep sea divers, and not even his mother would have recognized the figure at the wheel as H. H. Lyttle, who, after working all night to repair a slight break, held up the prestige of American manufacture and skill in a style that has since been the remark of his countrymen. The figures by laps will serve to show how nearly the running of his car approximated clockwork. That other and sometimes or one time American, George Heath, who sought to secure the laurels for France, was in dress the antithesis of Lyttle. Ht was attired as if for a pleasure spin, in a golf or cycling suit, cloth cap and ordinary overcoat. He wore also a standing collar and white puff tie, and looked handsome, healthy and wholesome.

The start, however, was really devoid of incident. Each moment the crowd increased, and the hedge of humanity that bordered each edge of the oiled strip lengthened and deepened, and only when Frank Croker made ready to start and his low- hung car drew up to the line and "backfired' in vicious volleys and rumbled and thundered like a battleship did the crowd evince the slightest disposition to increase the elbow room.

"GOD WAS GOOD TO THEM."

"God certainly was good to them," was the remark at the close of the day of one man who beheld the scenes at the starting points and witnessed the heedless crowds at the dangerous turns. It is not short of miraculous that none was injured. This feature of the race was in striking contrast to the discipline and clear courses that marked the Bennett cup races in Ireland and Germany. On those occasions, a spectator on the road was the exception, here it was the rule. There were no soldiers and not even a blue-coated policeman to command respect. The country constables who served or were supposed to render service did not appear to take even themselves seriously.

Of the nineteen entrants all started, save one, at the times scheduled. The exception was Alfred G. Vanderbilt's Italian car, driven by Paul Sartori. It was due to start at 6:18. It actually started at 8:20:14. In the interim, Sartori was three miles away, straining might and main, to right a balky motor. If Albert G. ever had any hope of having his name inscribed on the great silver goblet given by his elder brother, the hope died early, for even as Sartori started he was disqualified. He violated the rules by making a flying start and was "called off" by telephone at Hicksville, some five miles distant. There was an argument over the 'phone lasting eleven minutes, which resulted in the lifting of the ban, and Sartori restarted. His clutch, however, went wrong, and he stopped "for keeps" about ten miles further on.

The starters, their official numbers, their order and time of starting follows:

PRESIDENT H. W. WHIPPLE, A. A. A.

Immediately the last car was dispatched the crowd again took possession of the road. Friends seated in cars left their cars and visited friends in the grandstand; friends in the grandstand left the stand and visited friends in the cars. Acquaintances in neither cars nor stand met and chatted on the road or at the roadside. It was like a huge picnic—an effect which was heightened when hampers were opened in response to the calls of the inner man—and inner woman, for womankind was well represented, and during the chill morning hours remained heavily muffled in bearskins and furs, adding to the picturesqueness of the scene. The officials seemed legion. They were everywhere, and it appeared that every color of the rainbow had been called on to afford distinctiveness to the brassards which each wore on his arm; each man's wide silken ribbon seemed of a different hue, and each bore his particular title, and the caption "The W. K. Vanderbilt, Jr., Cup"—not "Cup Race," just plain "Cup."

THE REFEREE.

As the referee of the race, it follows that Mr. Vanderbilt was a conspicuous figure, and withal a pleasant one. His feats in racing cars and racing boats had already demonstrated that he did not lack courage. His performance as referee was convincing of his possession of brains and ability. His eye was keen and head clear. Nothing appeared to escape him. He was here, there and everywhere. He mingled freely with common folk, was companionable to a degree, and his "Now, gentlemen, in the interests of the race, won't you please stand back?" had more effect on the crowd than any other one thing. He climbed fences, sat crosslegged on the officials' stand, and bore the almost incessant fire of a score of cameras with unfailing good nature. When, early in the day, word came that one of the contestants had been killed, he took a doctor in his car and speeded to the rescue. It proved a false alarm, but he was not satisfied until he had seen the alleged victim in person. When, after the race, young Clement came up to lodge his protest, Referee Vanderbilt had the laugh on the newspaper men who crowded around. None could understand French. The referee was familiar with it, and only he was able to comprehend what Clement was saying.

Not so conspicuous, but very much in evidence, was A. R. Pardington, the chairman of the A. A. A. racing board and of the Cup commission. The brunt of the work had fallen on his shoulders, and for a month at least he had had few minutes that he might call his own. Witnessing the fruit of his hard labor well performed, he was as quiet

A GLIMPSE OF THE GRANDSTAND—THE VANDERBILT BOX.

and unassuming as ever, but he looked worn and weary, and as if he longed for the rest that would soon be his.

WHAT THE SPECTATORS SAW.

Approaching the grandstand was a bend in the road that hid the cars from view until within a quarter of a mile of the line. It was not until the cry "Car coming!" was heard and taken up and repeated that the crowd scampered and formed the narrow human lane through which the flying cars passed repeatedly, or until near the end of the day, when a rope was obtained and stretched, forcing the crowd back to the edge of the road and thus widening the lane somewhat. To descripe one lap is to describe all.

"Car coming! Stand back!" . . . Scarcely has it died away and necks have scarce been stretched to better see it than, "It's Gabriel!" goes up. . . . A whizz. . . . A thundering white beetle of heroic size fairly skimming the earth darts by. . . . A buzz of conversation; a fluttering of programmes. . . . A tall, cadaverous individual places a megaphone to his mouth and faces the grandstand. . . . "Car num-ber 2; time, twen-ty-six min-its, fif-ty-sev-en a-n-d two-fifths sec-onds," he would drawl. . . . Pencils seek programmes. . . . A buzz of conversation.

Nine times this happened, while the sun

HEATH IN PENSIVE MOOD.

waxed warm and men and women doffed their furs and became less like Esquimaus and more like Americans.

Several times the cry, "Two cars coming!" added a thrill of excitement. But the cars did not fly past abreast. One merely trailed the other in "After you, sir," aspect. The moment, or the next moment after, they cleared the clustering crowd the rearmost would pull to one side and in a flash dart past the other. It was at such times that the grandstand was at a disadvanatage. Necks were not long enough to follow the scene. The men on the road had a clear view and could see it all. Possibly it was because they realized their advantage that they held so tenaciously and regardless of danger to their positions.

THE MAN WITH THE MEGAPHONE.

The megaphone was a useful institution. Spectators were kept intelligently informed. They knew what was occurring. At the great races abroad they either guess at it or suck their thumbs in ignorance. It was so at the Bennett Cup race in Ireland; it was so when the contest for that trophy occurred in Germany. In this respect the Vanderbiltonian affair was distinctly superior. When a contestant was overdue, the splendid telephone system kept the officials informed of the cause, and the megaphone man as promptly shared the information with the public. The people knew when Tracy broke his shaft and when tire troubles and other mishaps delayed others. In the main they were knowing spectators, too. When Gabriel came by rather slowly their quick ears discerned something wrong. "His motor's skiping," was the word that passed along.

THE HEATH-CLEMENT DUEL.

For more than six hours this sort of thing continued. Once it was relieved by Heath. At one of the controls he had been told that

Digitized by Google

he was leading. When he passed the grandstand he removed a hand from the steering wheel and saluted. The crowd responded with mild applause. Then Heath had his tire troubles, and the young Frenchman, Clement, tucked snugly in what looked like the footgear of the "Old Woman who lived in a shoe," began to crawl up. The crowd showed its excitement. On the eighth lap Clement forged ahead. He passed the official stand more than two minutes to the good. The crowd applauded, and not a few of the many Frenchmen who were in evidence at all points betrayed symptoms of incipient hysteria. The French lad was still ahead at the close of the ninth lap—1:48 to be exact.

HEATH WINS AND KEEPS RIGHT ON.

Heath had picked up a few of his lost seconds, but it did not now seem that he would win. It all seemed over but the shouting. But the crowd had its doubts, and remained on edge until word came from Queens that at that point Clement was one minute behind. There was an animated buzz of relaxation, and when Heath hove in sight he was acclaimed heartily. It was the first outburst of real enthusiasm. The referee and donor of the cup forgot his position and joined in it. Heath displayed no consciousness of it all. He drove full tilt up to the line and over it. If in his make up there is aught of the "grandstand player" he gave no evidence of it. Each second was doubtless too precious. He gave no heed to the cheers, if, indeed, he heard them. Without slackening his pace a jog, he went on. He did not stop until he reached his garage, five miles distant. That is why a number of checkers were mystified and why Heath appears on their sheets as having passed their stations eleven times. Never was there a more modest victor.

CLEMENT LODGES HIS PROTEST.

It seemed much longer than it really was before the "Car coming!" cry denoting Clement's approach was heard. There were still others making the rounds of the course, but they were far behind, and the crowd had now no thoughts of or for them. The loser's lot is rarely a happy one. But he had been such a good loser and put up such a grand fight for 250 miles at least that when Clement dashed across the line he was as wildly cheered as Heath. When, ten minutes later, he came back on foot, supported on either side by friends and with a retinue of jabbering Frenchmen in his wake, which was constantly being increased by curious Americans, the crowd gave him an ovation. But Clement seemed deaf, indeed, he looked like a wild man. He had doffed his leather headgear and his goggles, and only the upper part of his face was white; the rest of it was black with grease and grime. His eyes rolled and he was wildly excited. He sought the referee, and found him in the press box.

THE CROWD BREAKS; RACE STOPPED.

The word passed that he was lodging a protest. It was enough for the crowd. It broke like a drove of sheep scampering after a bell wether and charged the press box, where Referee Vanderbilt and young Clement were exchanging a rapid fire of French. While the road was thus congested a couple of cars parked in the field at the roadside pulled out on the course and headed in the direction of New York; others immediately "took the cue" and did likewise. The officials and constables, or some of them, made manful efforts to beat back the tide. They pleaded and stormed and swore, but to no purpose. At any moment one of the giant racing cars might swing around the bend in the road. A frightful tragedy was imminent, or at any rate was being invited. The crowd cared naught, and those who of right and decency were expected to help and obey the officials flouted them. The automobilists simply blocked the road with their cars. There was no stopping them. The race officials were at their wits' end. But quickly it was decided to stop the racers at all hazards. Every telephone to every control and corner was brought into use. "Stop the men at all costs!" was the message sent.

Again was God good to that heedless crowd All the racers were stopped before they reached the surging mass of humanity, and its skin remained whole. But it was a bitter pill for Lyttle and Schmidt and Croker and the others. Officially the road was open to them for more than an hour, and to the men bent on finishing, "no matter how," it is gall and wormwood to be forced to quit. It roiled Lyttle so greatly that after the crowd had thinned he continued around the course for the tenth time that he might say that he had completed the whole distance. But no official cognizance of it was taken.

CLEMENT COMES TO PROTEST.

THE PROTEST AND ITS REJECTION.

When Clement was made to understand that he must reduce his protest to writing, he did so in this communication addressed to the referee:

"Under Article No. 56 of the road race rules, I beg to submit for your consideration the following protest for some penalization on time and loss of time which I sustained on account of timers and checkers applying erroneously some of the rules of the race.

"First, when arriving at Hempstead on my eighth lap the timer gave me my card. My chauffeur then did give some attention to my motor. The timer, seeing this, protested that I had no right to do any sort of repairs while in neutralization, and asked me to hand him back my time card. I at first refused, but fearing unknown decisions I handed back my card.

"The timers counted carefully the time I spent fixing up my motor, and put in my box the newly corrected card. As I had full right to attend to my motor personally while inside the neutralization, I claimed that this change in my time was unduly done, and to have the same deducted from my total time.

"Second—At Hicksville, while I was at the line ready to leave, I wanted to spend the remaining time in giving some little attention to my motor, but the timer absolutely prevented me, and in spite of my protests stated most strongly that he would not permit me to do so. I therefore had to push my car out of the control to attend to my business.

"In not respecting my rights the timer has been the cause of my losing the remaining time to expire before my order to leave plus the time I spent in pushing my car out of control after being given my start. This occurred twice at the same place, and cost me one minute, at least."

At about midnight Referee Vanderbilt announced the disallowance of the protest in this language:

"In answer to the first specification of M. Clement's protest I have decided as follows: That M. Clement had no right to stop and make repairs undertaken after entering and before proceeding through the control; having been warned by judges and timekeepers, his original card was recalled and properly corrected on his failure to comply with instruc-

Digitized by Google

ttions, and that M. Clement, if he had followed the order given, would have consumed, as required by the governing regulations, six minutes in passing through the confines. Therefore his claim for lost time in making repairs after due instruction of judges and timekeepers is disallowed.

"In answer to the second specification, alleging that he was obliged to push his car from the exit of the control, the evidence does not sustain the statement."

At the "Curve of Death" in Jericho.

At Jericho, a scant three miles from the starting point, was what those wise and thoughtful exponents of journalism known as the "yellows" termed the "Curve of Death." Approaching the town is a sharp Y; in the apex itself is a stout tree; in line with the apex of the Y is a country store, in which is located the postoffice; immediately adjoining is a grocery. The "yellows" had resorted to lemon hued mathematics, and figured that if a snorting "red devil" attempted to tear around the curve at a million miles a minute it would fly off at a tangent, split the little postoffice into kindling wood, paste postage stamps on the pickles in the grocery and smear the landscape with rich, golden butter and axle grease, while postmaster, grocery boys, chauffeurs and a few spectators would become angels and soar in company to the pearly gates. It was an alluring picture, full of "action," excitement and color. And as immediately after rounding the sharp bend there was another wide, sweeping curve which skirted a little pond, the combined prospect of probable "developments" was enticing. "Go to Jericho" was the injunction of every man to every other man when a desire to find the best place to witness excitement was expressed. Every newspaper man coveted the berth. They all scented a "story." The "yellows" all had men and cameras trained on the spot. The picture of a big automobile butting into a United States postoffice, with the attendant mangling of limbs and splashing of red gore, would be worth "big money" to any paper, whether red, white or yellow. It was worth "going after"—worth waiting for. In consequence of the "fame" thrust upon the little dot on the map there was a fair crowd and at least a dozen automobiles gathered at the Jericho turn. There were many women and children in the assemblage. Apparently they had not read of the fearful prospect outlined for the postoffice and grocery, for fully three-quarters of them congregated on the front stoops of those very buildings—and not a hair in their heads were harmed; not a baby boohooed for fear of the "red devils" during the whole long day. In fact, one of the women, whose garb betokened wealth, stood with a little boy under the tree in the very triangle formed by the fork in the roads. The little fellow wore a Buster Brown outfit, and the lady was evidently his mother. Just as one of the "demons" waltzed not ungracefully around the turn she was heard to say to him:

"Some day you may be driving one of those," indicating the disappearing car. "Won't that be nice?"

The little fellow seem to have doubts on the point.

"Why, it isn't every little boy that has the chance," she responded.

If a real yellow journal had heard the remark it might well editorialize on the degeneracy of womankind and the perils of the future generations!

In the early morning a far distant click, click, click, that seemed to come from over the hills in the rear of Jericho, was the first thing to convey the knowledge that the race had started. It was not realized at the time, but as the day wore on the meaning of the sound—the echo of the approaching car—was realized. The click would be heard long before the car hove in sight.

It is not to be denied that on the first lap or two there was apprehension. When the cars came near to the turn the crowd instinctively moved out of its "angle of action." The two signalmen, with their flags, moved with the rest, a little slower perhaps and somewhat sheepishly, but they moved. When a spectator sought the protection of the lone tree in the triangle, one of the white flag wavers expressed himself.

THE "CURVE OF DEATH!"

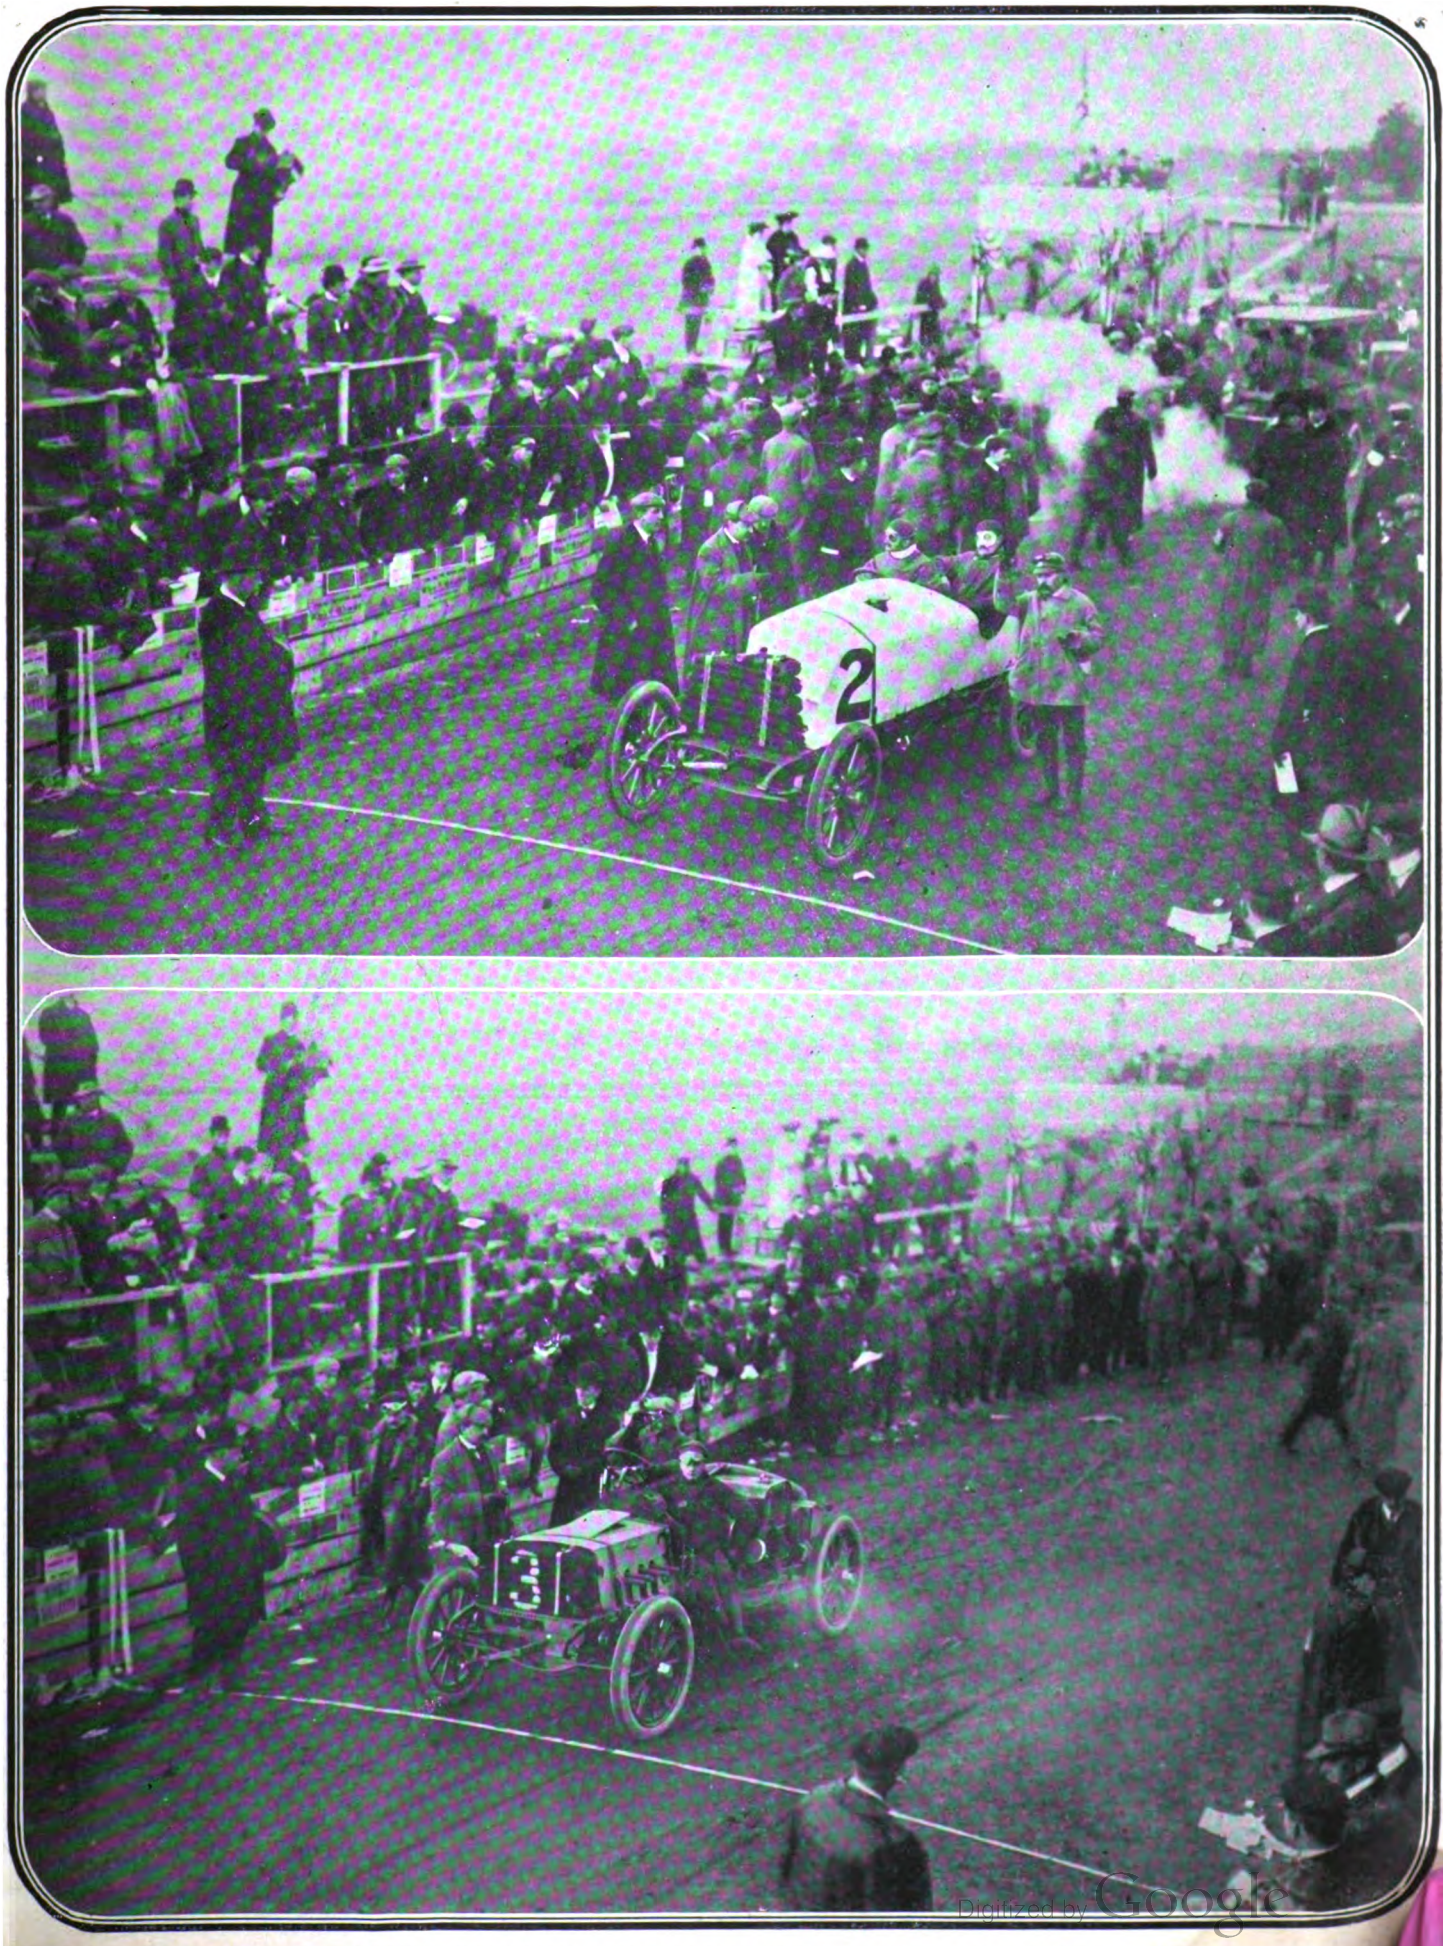
"Better get away from there!" he advised almost authoritatively and with one eye down the road.

"Want it for yourself?" asked the other fellow, half derisively.

The drivers, like the spectators, gained confidence on each succeeding round. On the first lap Heath, Teste and Croker negotiated the curve in splendid style, Teste perhaps best of all. But it was Croker who evoked the first few cheers, of which there were not many at any time. While all of the others cut off power or reduced speed before reaching the Y, the big, good natured son of the "ex-boss of New York" came up like a cannon ball, and was rounding the corner itself before he seemed to slow ever so little. He swung wide, and his engine emitted a noisy volley of "backfires," but he was safe, and it was so spectacular that a buzz of admiration swept the crowd and a few cheers broke. When Hawley came up he seemed timid or undecided and slewed away over. Bernin and Clement also skidded badly, but it was not until Wallace approached that there was a vestige of excitement. Fire and smoke were shooting out of his engine and his gears were grinding. He made the turn and came to a stop. His gears had locked fast. His chauffeur leaped out, and it seemed scarcely a minute before he had made matters right and resumed his seat. The car started slowly and seemed about to stop. At the first sign the chauffeur jumped out again, and as he did so the big car bounded forward and knocked down the chauffeur, the rear wheel passing over his leg.

HOW WALLACE EXCHANGED CHAUFFEURS.

Then followed a remarkable exhibition of quick wit and agility. A little foreigner who was standing near grasped the situation in a twinkling and leaped aboard the car, and was off with it while the crowd was yet groaning. It all happened so quickly that it is safe to say that Wallace did not know of the accident or realize the sudden and unexpected change of chauffeurs.



"If he stops again he'll have an interesting time," remarked a man who picked up Wallace's starting crank, which had been dropped in the road during the flurry.

The injured chauffeur was carried to the Diamond Rubber Co.'s tent nearby, and soon recovered, and within half an hour was regaling himself at the hotel bar, unconscious of the wild rumors of his death that swept the course. The watchers at Jericho did not realize how alarming had been the rumors until Referee Vanderbilt himself dashed up in his car with a doctor to learn the particulars. He was not content until he had interviewed the man himself.

During the day Jericho itself heard rumors of various killings, based on garbled and confused reports of the Arents accident, and also heard that the telephone man at Hicksville had been mobbed. But the closest resemblance to an accident that the crowd saw

was on the second lap, when Luttgens, driving Isidore Wormser's Mercedes, swung around the turn. He skidded frightfully, ploughed up the sand in the roadside ditch and seemed about to upset. There was a breathless moment, then the left front tire exploded with terrifying force. Luttgens stopped for a moment and then went on with his tire flat. Only the American tire makers had stations at Jericho. There was no help for the German there.

WHEN CROKER'S TROUBLES BEGAN.

On the very next round Croker exactly duplicated Luttgen's performance, and while his noisy motor cannonaded the atmosphere he pulled out of the sand with his left front tire flat and wobbly. His car was fitted with Diamond tires, and the Diamond tire station was on the spot. The car pulled to one side, the Diamond men went at it with a will, and in fourteen minutes by the watch all was well again. During the operation Croker, wearing a sweater and headgear, and looking for all the world like a stalwart college football player, was calm and collected, just as his chauffeur was all excitement. Only once did Croker seem perturbed. There was some fumbling in inflating the tires and they were not pumped hard enough. He saw seconds slipping away. "Pump 'er up! —— —— it! Pump 'er up!" he finally exclaimed in vigorous English. The chauffeur added a few selected words of his own. The repair completed, Croker took his seat in the car while his "man" turned the crank. The engine did not start promptly. The man threw expletives at it and got it going. They moved a few yards, then stopped, then started, then stopped again. The chauffeur hopped out. Even the insects in the air fled from the heat of his words. The second speed was found to be stripped. Croker threw in the "high" and was off, the cannonade of the motor fairly awaking the echoes.

THE YELLOW "EXTRA" ARRIVES.

On the second round Gabriel was away ahead. It induced a young man with a roll of bills to produce them and offer to bet any part of $400 that the Frenchman would win. Later he changed to Heath, but he could find no takers and drove away in disgust in a buggy. Gabriel seemed to be a favorite with the Long Islanders, and they followed him closely. About noon a couple of men with armsful of a New York yellow journal appeared. They must have known the predelection of the residents and that Gabriel had joined the ranks of the missing. "Extra! All about Gabriel killed!" they shouted. They charged five cents for the penny sheet and reaped a small harvest. The men did not linger, and perhaps it was well. There was not a line in the paper about an accident to the Frenchman.

The most reliable budget of news that Jericho received was when Joseph Tracy arrived, not in his Royal racer, but as a passenger in a White touring car.

"First broke my transmission rod," he said when questioned, "but found a blacksmith shop and made a new one. Then two cylinders cracked, and as there wasn't a foundry convenient I had to quit."

CHAIRMAN PARDINGTON.

Some one who heard him ventured to remark the great superiority of the Awerican drivers and to disparage the foreigners. "You ought to see the Americans make these turns," he added.

Tracy refused to agree with the sentiments, and said so.

"The Frenchmen may not slam around the turns," he said quietly, "but they make them and get away a great deal quicker, and that's what counts."

And so the day at Jericho wore on. The "red demons" and "devil wagons" resolutely refused to kill any one or to demolish the postoffice. The postage stamps and the pickles remained safe to the end.

DISGUST!

"Say! Wouldn't this make you tired?" disgustedly said a long Island resident toward the close of the race. "I picked out this place and have hung around all day to see something doing, but I'll be damned if I haven't seen more excitement at the horse races on the road at Huntington—and nobody ever tried to stop 'em with an injunction, either."

In the Hicksville Control.

Compared with Hempstead, Hicksville was a minor control—one of but three minutes. But it made its share of history, and it was proud of its "bicycle boys" that piloted the big cars through the town—and, b'gosh! most of the boys beat the ortermobeels to the tape, too. Most of the pilots on bicycles really did seem possessed of the idea that it was necessary to see how fast they could cover the four-tenths of a mile between the two tapes.

Hicksville also had the honor of "entertaining" the first unfortunate, William Wallace. On the very first lap, and less than six miles from the start, he arrived with the spring of the clutch of his Italian F. I. A. T. broken and impossible of release. The car was drawn to the side of the street, and remained there, though a half dozen men tried vainly to repair it. Wallace meanwhile roamed restlessly. He had practised self-denial for two months in preparation for the race, and the thoughts of what he had missed appeared to come before him.

"For two months," he remarked half ruefully, "I refused every drink that was offered me, and I am afraid none of my friends will invite me now."

SARTORI'S GREAT SURPRISE.

Mr. Wallace is also a member of the A. A. A. racing committee and of the Vanderbilt Cup commission. He was in Hicksville when the long delayed Sartori arrived in A. G. Vanderbilt's car—also a F. I. A. T. It was at Hicksville that the telephone message to stop and inform him of his disqualification overtook Sartori. The control judge duly informed Sartori of the fact, and waved him to the side of the road. The judge speaks English only; Sartori speaks only French; ditto his chauffeur. The judge was having a hard time of it trying to make himself understood when one of those Frenchmen who seemed to be all over Long Island stepped up and offered to act as interpreter. The offer was not refused. When Sartori grasped the meaning of it all the amazement that overspread his features was a study for an artist.

"Pour quoi? Pour quoi?" he asked.

"Pour quoi? Pour quoi?" echoed his chauffeur.

None could give him more information than that he had "disobeyed the orders of the referee."

More amazement. More "Pour quois."

Finally Wallace stepped up and learned the cause of the argument.

"Let him finish the round," he suggested.

The control judge refused to go behind his instructions.

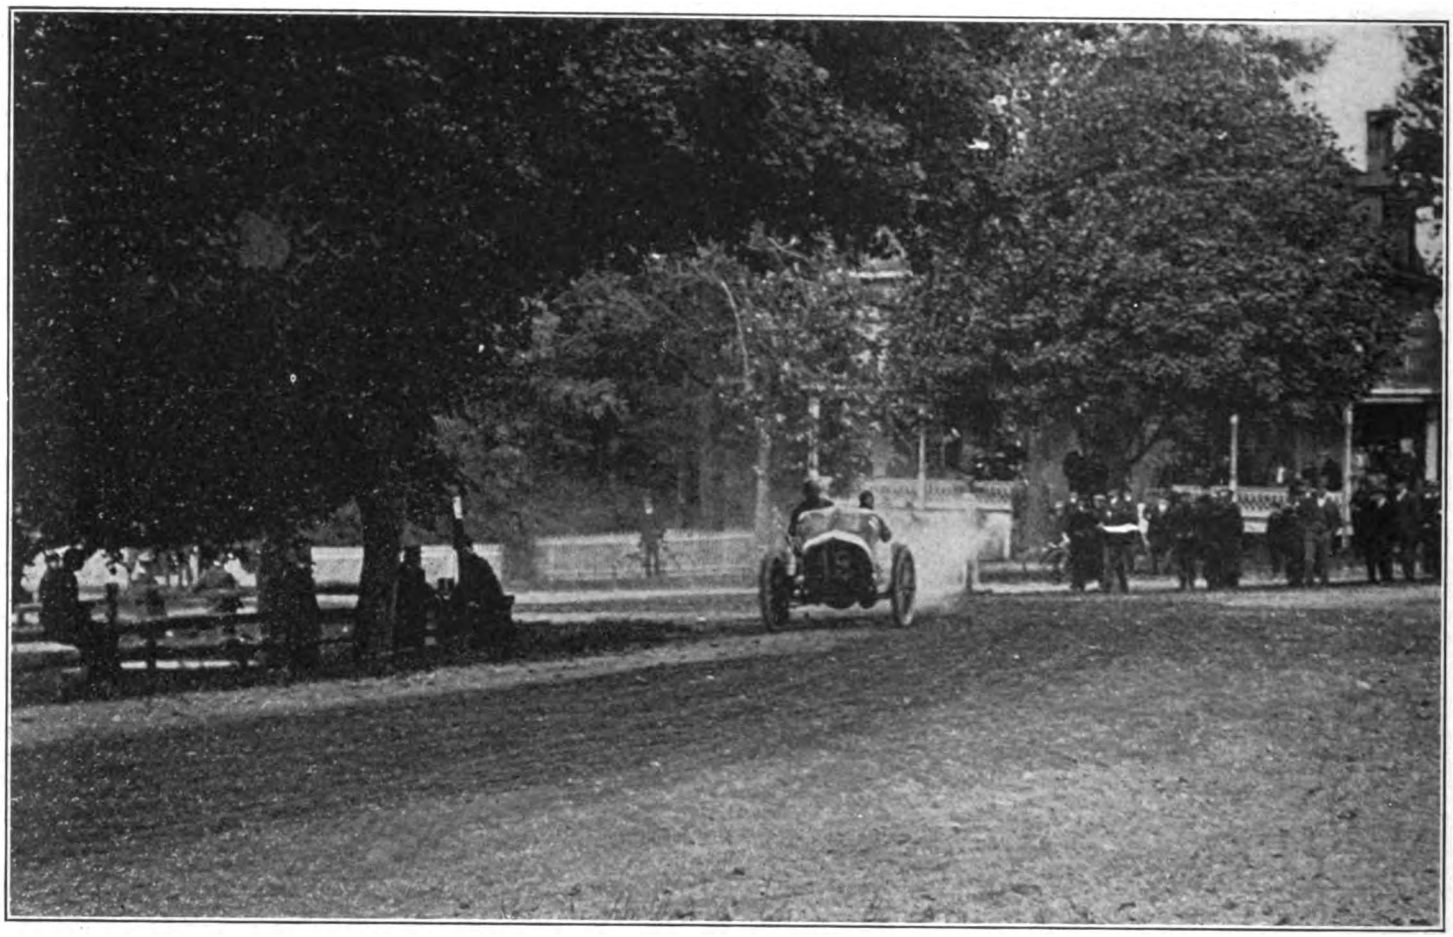
"Damned shame!" ejaculated Wallace.

"Will you speak to Mr. Pardington?' asked the judge.

"You bet I will," and Wallace repaired to the telephone and spoke with him for quite some time.

The upshot of it all was that Sartori was permitted to restart, but he did not go far. The clutch of his car went wrong exactly as Wallace's had gone wrong, and he was not seen in Hicksville again.

It was while all this was going on that a young couple stood on the sidewalk surveying the scene.



"Isn't it terrible?" remarked the young woman.

"I don't see anything terrible about it," responded the young man in a tone that implied either brother or husband.

"Well, I do," she retorted decisively, "and I think those men ought to be able to find something better to occupy their time."

Negotiating the Turn at Jericho.

Digitized by Google

THE EXCITABLE CLEMENT.

It was at Hicksville, too, that Albert Clement performed some of his choicest genuflections and gesticulations. It has been said that he learned English in two weeks; and perhaps he did. But his hands and his eyes talk a language of their own. He and they seemed always quivering with excitement. Once he drove over the boundary line of the control.

"Where in hell are you going?" was the question that promptly assailed him.

He must have understood that English, for he jumped out like a shot and helped push his car back to the line. Clement seemed to have an argument ready nearly every time he came around. He had been stopped once while making some minor repairs within the control limits, but the very next time his chauffeur again tinkered with the motor while it was on the line. Again was he ordered to stop.

"Ha! What I do?" he asked volubly. "They say I can work. He say no." The remainder was lost in the lingo of France.

GABRIEL DOWN AND OUT.

It was at Hicksville, too, that Gabriel—Gabriel, the renowned and the daredevil—hauled his De Dietrich to the side of the street and left it there. He previously had had carburetter troubles, but it was an overheated engine that caused his pretty white car to hug the Hicksville curb for so long. Not all the Frenchmen in Hicksville could get it going again.

It was here also that Croker sustained another puncture and again effected a repair in fourteen minutes. Previously Luttgens had arrived with not only a flat tire, but a flat rim. He lost twenty-five minutes while both were being remedied.

At Plain Edge—Another "Curve of Death."

Plain Edge, a couple of houses surrounded by pumpkin fields, and marking the crossing of the Hicksville-Massapequa and Bethpage roads, was another "Curve of Death," where, according to the "yellows," lives probably would be snuffed out as a sacrifice to "speed mania." Reporters and cameras were there to record the snuffing. The fact that the two roads crossed at right angles and formed an acute angle which on the narrow road absolutely prevented turns at speed was apparent to all thinking beings, who quickly eliminated Plain Edge from their lists of "danger points." Only the officials and "yellow" reporters gathered there. It was the loneliest spot on the course, and the little crowd faced starvation. They were saved only by the opportune and unexpected arrival of an itinerant pie wagon. Although the owner of the pies might readily have obtained triple prices for his wares, he asked only "usual rates." This was the rule everywhere. The Long Islanders made no effort to fleece their visitors. Two or three enterprising natives erected "grandstands" along the course, and were really the only ones badly bitten. The stands were absolutely deserted. The chief cry was for food and drink, and as the forenoon aged some of the natives awoke to the fact, and the sandwich was paraded in force and silenced the growlings of many empty stomachs.

Like all of the other corners, the Plain Edge turn played its full part in playing havoc with tires, but the only real thrill that was experienced by the watchers was when Gabriel overtook Lyttle. The latter ran wide, seeing which the sharpeyed Frenchman cut the corner and passed the American on the inside. It was a beautifully executed movement, which gave rise to a cry of "Foul!" on the part of a few patriots. They conceived that Gabriel had crowded Lyttle. But the charge was baseless. Tart was another man that evoked admiration by the way in which he made the sharp turn. He would cut of power, apply the emergency brakes and simply skidded around—a delicate manœuvre that he repeated skilfully several times.

CONSTABLE REALLY MAKES AN ARREST.

It was at Plain Edge that the only known arrest of the day was made. A party in a touring car essayed to pass while the racers were approaching, and was stopped and warned away. The driver did not accept the warning in good part, and a heated argument ensued. It was finally ended when some one whispered into a constable's ear:

"Pinch him! He has no license number on his car."

The constable performed the "pinching," and never was a man more taken aback than when the obstreperous individual found himself under arrest.

At the Hempstead Control.

It would naturally be supposed that at Hempstead, which is, next to Queens, the largest town on the course, a considerable number of spectators would have gathered. This was not the case, however. At six o'clock, the hour of starting, a score or score and a half would be a fair estimate of the number scattered along the main street of the town. As the morning wore on others came, some from the adjacent residences, others from greater distances, until there were close to one hundred people standing watching the race and discussing its various phases. Probably a quarter of these were congregated at the beginning of the control.

"Here comes one! Clear the way there; make room for it!" shouted one of the beribboned and soon to be hard worked officials of the race, as he waved his arms at the handful of spectators gathered at this point to urge them to seek places of safety.

The car was not yet in sight, but from the east came the subdued but sharp, spiteful staccato sound of an exhausting engine, rapidly increasing in intensity as the invisible monster drew nearer. A slight bend to the north, not quite a mile away, shut off further view. It was broad daylight, although the laggard sun was hidden behind gray clouds. The air was still keen, although greatly moderated from the frost point of the pre-daylight hours. A faint mist was slowly and reluctantly withdrawing, as if it recognized the futility of longer resistance to the onslaught of the strong waxing day.

WHEN GABRIEL REACHED HEMPSTEAD.

"There she is! Ain't she coming?" cried a voice suddenly; and, "Yes, yes; see her?" chorused half a dozen more, as an uncanny looking and swiftly moving object swept round the bend and came into plain view. It was low, and at that distance resembled nothing so much as a gigantic beetle, with rounded nose close to the ground.

"It's No. 2," cried a dozen voices in unison, as the outlines of that numeral, Brobdingnagian in size and covering the entire front of the bonnet, were revealed to view. Straight as an arrow, and with speed that seemed to double with every second, it came, looming bigger and bigger, and the thunder of the exhaust filling the air. Some of the bystanders who had retired to the side of the road went back still further as the fearsome looking thing came on without a suspicion of speed slackening. But suddenly, when still 150 and 200 yards away, the clutch was slipped out and the throttle closed. On she came with scarcely diminished speed, but at about thirty or forty feet away from the tape the brakes were applied with such force as to lock the rear wheels and cause the heavy car to slide along and come to a stop two or three yards beyond the tape; its driver, the cool and self-possessed Gabriel, goggled, gloved and well wrapped, little of him showing except his black mustache, shifting his position slightly as if to relieve himself.

An alert and businesslike official stepped up, marked the time of arrival on the piece of yellow cardboard, calling "6:19," as he did so, and nodded to the Frenchman to go on. A boy bestriding a bicycle, on his arm the inevitable broad ribbon—white and inscribed "Pilot"—started in front, but soon pulled to one side as Gabriel pressed him close, and the two disappeared down the road.

He had scarcely cleared the next block when another car, which hove in sight as Gabriel entered the control, dashed up at a pace scarcely less swift than the latter's. This was No. 1, the Stevens Mercedes, driven by Campbell, who had started from Westbury two minutes ahead of the Frenchman and been caught and passed before half the first lap had been covered.

"Six twenty!" called the timer, as Campbell came to a full stop. Waiting only to have his card vised, he released the brake lever, threw in his clutch and was off, in company with a second pilot.

SPEED LAWS ARE ABROGATED.

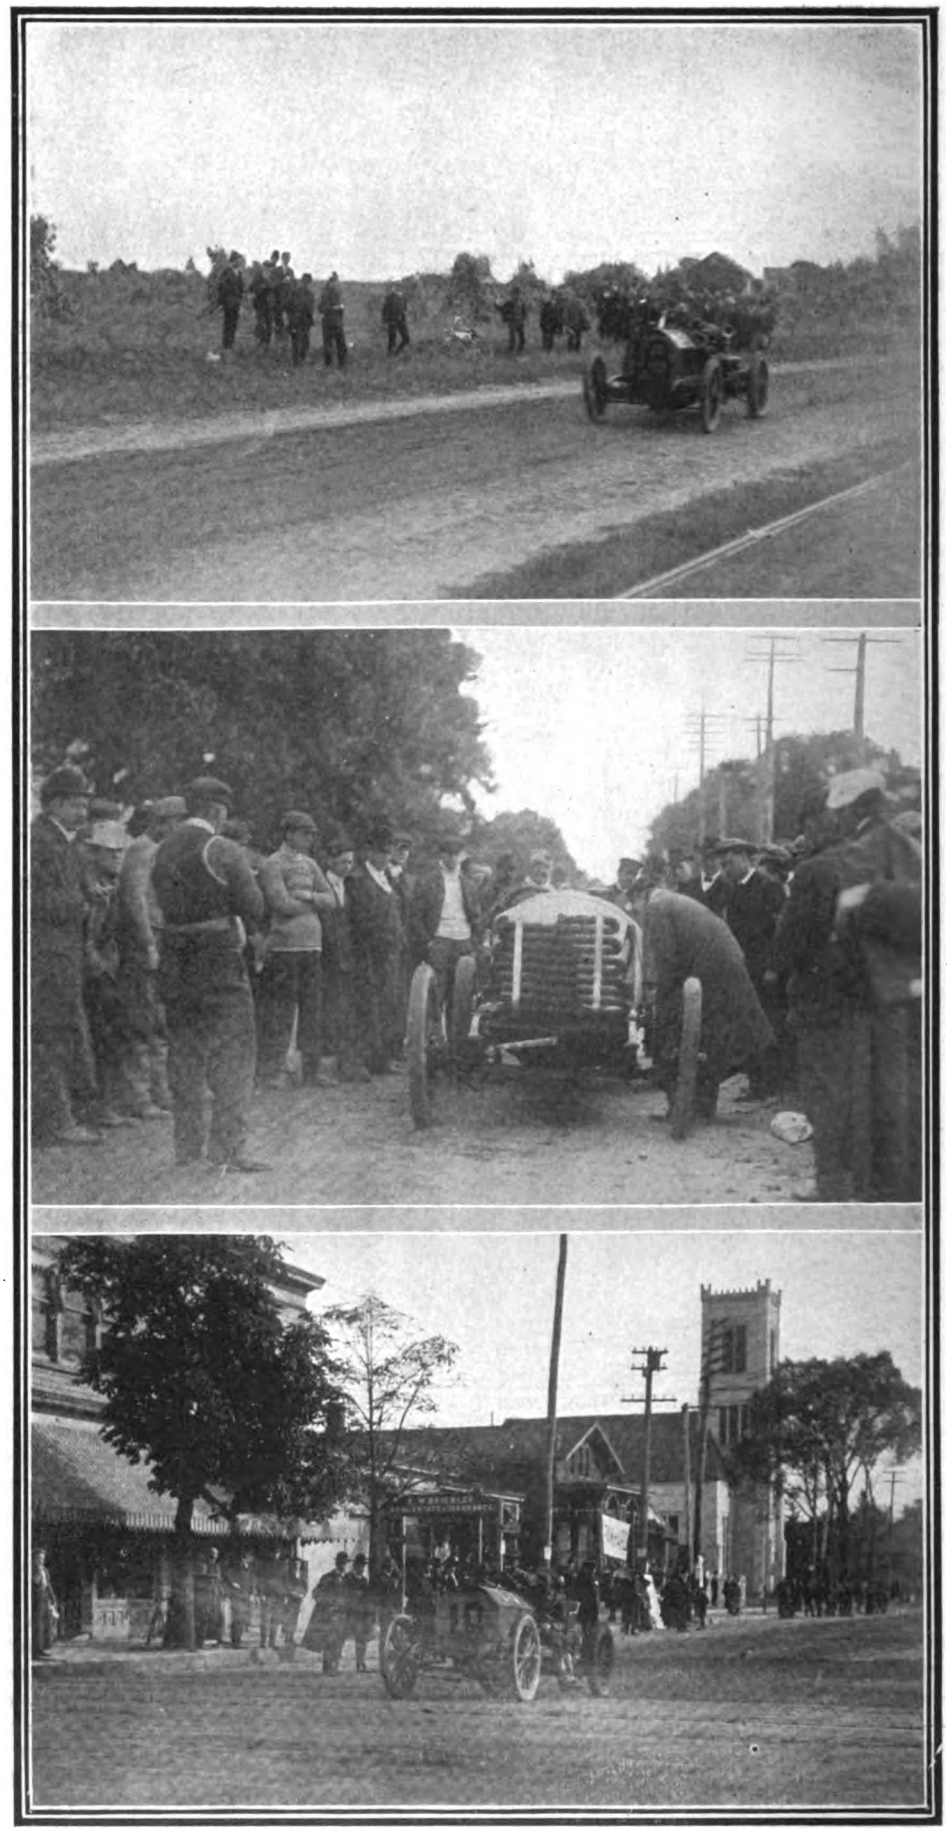
"Gosh! They didn't lose any time gettin' here," remarked a native who had been an interested spectator of it all. "Guess they didn't stop to observe no speed laws."

Located at the eastern and western ends of Hempstead Village, the control measured 1.4 miles. The cars were given six minutes in which to cover this distance; if they took less than that time they were held at the

Digitized by Google

western end until the six minutes expired; if more than six minutes were taken a penalty was imposed. They all took less than six minutes—very, very much less.

At the eastern end of the control two tapes were laid across the road, about twenty-five feet apart. Between them each car had to come to a full stop, its time being taken then and not before. Overhead, pendant from a wire strung across the road on poles, was a piece of bunting lettered to denote the control station. At the side of the road was a high platform, on which were perched the three timers and scorers. Everything had been capably planned, and the plan carried into execution. The precaution—a very necessary one as it proved—of raking a covering of gravel and sand over the oiled road between the tapes and for about twenty fet behiud the first tape had been observed; in this way the wheels of the oncoming cars would get plenty of traction and be able to check their speed quickly.



ARENTS'S FIRST MISHAP.

Several minutes elapsed after the passing of Campbell before the next car was heard in the distance. As it approached the exhaust was seen shooting out from the side of the bonnet, and it scarcely needed the sight of the number to see that it was Tracy's Royal, which, starting two minutes behind Gabriel, had lost four minutes. A short distance behind him came A. C. Webb in the 60 H. P. Pope-Toledo, while right on the heels of the latter was the Arents Mercedes. In his eagerness to catch Webb, Arents came on too fast. Too late, he put on his brakes so hard that his car skidded, went to the right hand side of the road and ploughed a deep furrow in it, turned half way around and burst a tire, at the same time dislodging the mecanism from his precarious seat and landing him in the road. Nothing daunted by this contretemps, however, Arents continued on after getting his time, with his tire flat and bumping on the rim.

"Guess I'll climb a tree if any more come like that," remarked the native already referred to, after Arents had disappeared down the road. This raised a laugh, as he had been one of the first to run for cover, and the car had never got within a dozen feet of him.

TAKING CHANCES WITH FLAT TIRES.

Heath, who went through Hempstead at 6:30, was even then a marked man. He handled his car with rare skill, coming fast to the control but stopping it without locking the wheels. Indeed, after the first round or two, all the contestants learned to gauge the distance better. Lyttle, in his little 24 H. P. Pope-Toledo, entered the control with Hawley in the E. R. Thomas Mercedes; both were given the same time. The next four men were Bernin (Renault), Clement (Clement). Tarte (Panhard) and Teste (Panhard), who passed in that order after a remarkable speed duel; each had made up some of the distance on the driver in front of him, Teste having gained more than a minute on Tarte. Teste travelled the fastest coming into the

WHERE THE CROWD DID NOT ENCROACH.

GABRIEL IN HEMPSTEAD.

CROSSING THE HEMPSTEAD CAR TRACKS.

Digitized by Google

control of any of the contestants, yet he made a splendid stop.

That the drivers were bent on taking desperate chances was shown on the second round. Gabriel had just gone through when Campbell came into the control. His left hand front tire was gone completely, yet he shook his head when it was pointed out to him, and went off at once.

BICYCLE PILOTS "CHUCK IT."

At a few minutes after 7 o'clock the bicycle pilot brigade gave out. There were only half a dozen boys in it, and they had volunteered to take the cars through the control at the legal speed and see that no repairs were made within the boundaries. There were not enough boys, in the first place; and it proved to be too strenuous a life. The racers paid little attention either to the boys or to the speed limit; they outspeeded both, and the boys came to the conclusion that the sensible thing to do was to "chuck it," which they did.

Although six minutes between control bounds was obligatory, few of the contestants took that much time. Twenty or twenty-five miles an hour was as slow as most of them seemed to want to go. The foreigners, in particular, were troublesome. In the centre of the town, near the corners of Fulton and Main streets, was the police station, and adjoining it the railroad station. In front of the former a stout policeman took his stand and attempted to restrain the impatient drivers.

FAT POLICEMAN'S PROTEST.

As Heath approached on his second round the stout myrmidon of the law struck an impressive attitude and raised his hand and cried:

"Go slow there; go slow."

Heath gave him a look out of sleepy looking eyes, and went by without slackening. The officer looked disgusted.

Then Charles Schmidt, crouching low in his seat and going nearly thirty miles an hour, hove in sight. Again the policeman sought to check him, and with an equal lack of success. A third time he tried, one of the Frenchmen being the offender. The latter looked at the policeman inquiringly but uncomprehendingly—and drove on.

"Do you see that?" he inquired, turning to a bystander. "That's the way they observe the speed limit. If I had my way I'd stop them.

"What is the use of it all, anyhow," he went on. "They're crazy. Everybody's going crazy over automobiles. Ripping around the country in this fashion! It's disgraceful, that's what it is."

"Why don't you get out in front of them and make them stop?" asked a man in overalls—evidently a railway engineer or fireman—with a wink to a group of interested spectators.

"Stand in front of them? Think I'm a fool to let one of them jabbering Frenchmen run over me? Not on your life," sputtered the officer. "That ain't what I'm hired to do"—and, seemingly to prevent further discussion of the matter, he walked up to the corner and took his station there.

It was now nearly 8 o'clock, and the crowd was slowly increasing in numbers. Commuters would stop a few minutes and watch until a car whizzed by and then take their way to the waiting train. Teams would drive up and discharge a load of people who had evidently come to stop and watch the race. From the trolley cars which crossed the course at this point parties disembarked, many of the with newspapers in their hands, which they scanned as each car went by and so identified them. Everybody was interested in the race; those who had the time to spare devoted it to watching the contest, while those not so fortunately situated looked their regret.

"Goin' to watch them, Bill?" asked a friend as a man with a big basket in each hand stopped on the sidewalk for a minute.

"No, I got to 'tend to my orders, darn it," was the reply.

PHOTOGRAPHIC SUPPLIES EXHAUSTED.

Enormous was the demand for photographic supplies, but the supply was infinitesimal. The Motor World man wanted a roll of films, and he waited patiently for the only photographic establishment in Hempstead to open. Seven o'clock arrived and passed, and half past seven likewise; then eight o'clock, and still the place was closed. A Winton car drove up and a couple of men alighted and rattled the door, but without avail. A few minutes later the much sought merchant came strolling up and was immediately surrounded by a group of would-be customers.

"Awfully sorry," he said, raising his hands deprecatingly. "But I'm all sold out. That's the reason I did not think it worth while to open sooner. The only thing I have left is a few rolls of films for the smallest size cameras.

"Next time there is a cup race down here I'll be prepared for it," he continued. "Why, I have been overrun—completely swamped. Sold out late yesterday afternoon and thought I had supplied everybody within fifty miles of here.

"How much stuff have I sold?" he repeated, in response to the Motor World man's inquiry. "Well, I usually carry stock enough to last me three weeks. In preparation for this race I laid in a double stock on Thursday. Yesterday afternoon it was all gone. Why, I even sold a $25 camera to a man who bought it principally to get the films it was loaded with. He said he didn't want the camera particularly, but he did want the films.

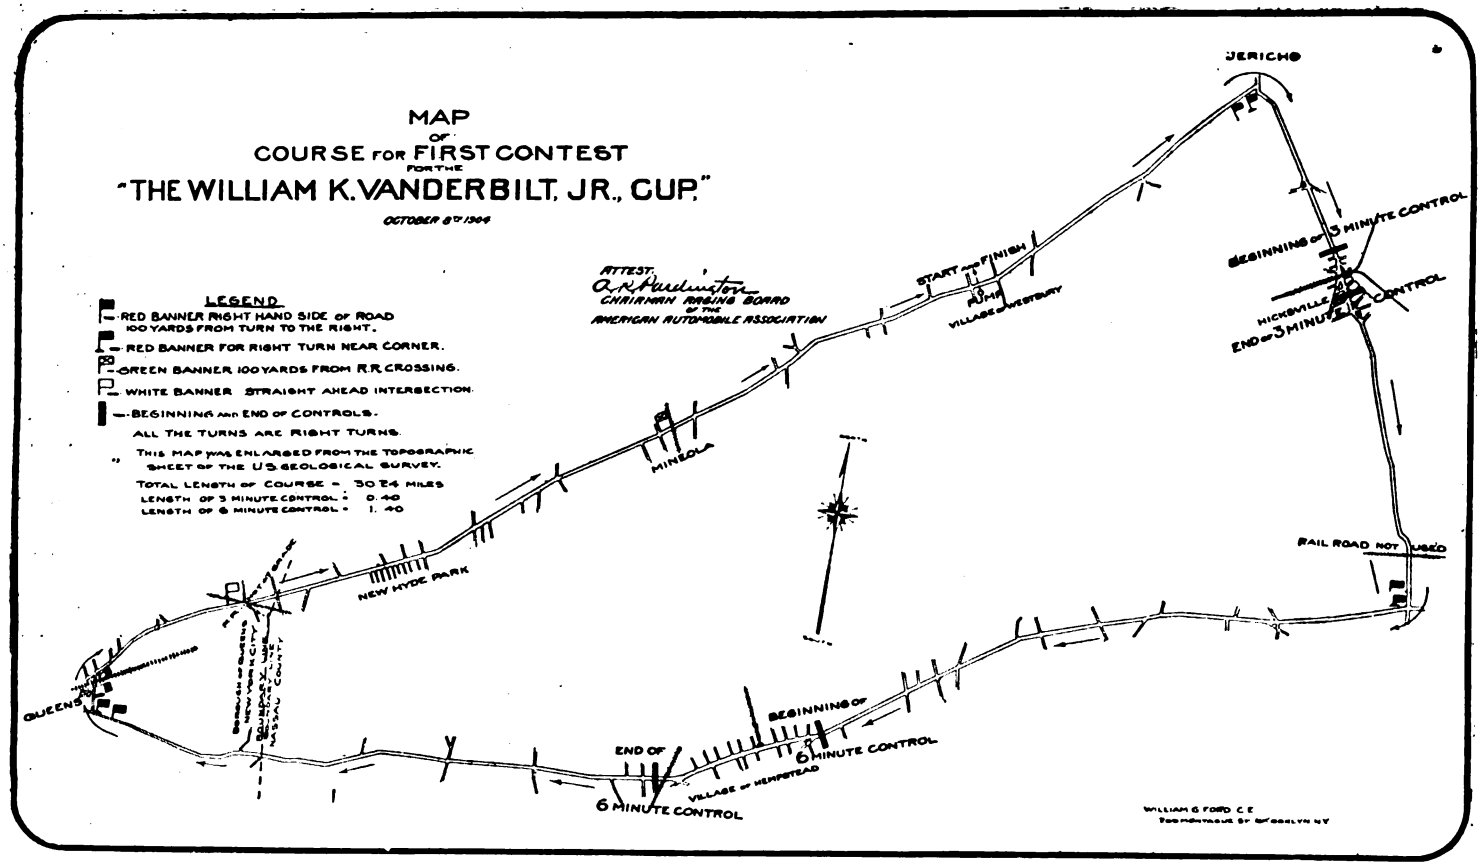
"No, you can't buy any films any place else in Hempstead. Hicksville and Jamaica are the nearest places, and I shouldn't be surprised if they were sold out, too."

A TIRE REPAIR.

At the end of the Hempstead control matters moved with clocklike regularity. Beribboned officials were there ready to take the cards of the arriving contestants and hold the latter until the six minutes allotted for traversing the control had elapsed. On the south side of the road was a telephone box, from which the arrival and departure of each car was reported to headquarters. A man with a rake put a fresh coat of gravel on the road in front of the tape at frequent intervals. In a field at the north side of the road was a Diamond tire repair station, which, however, had nothing to do. A tent had been pitched, and inside of it was a goodly stock of tubes, covers, lugs, etc., while in front of the entrance, ready for instant use, others were disposed.

"PANNE" THAT DEFEATED CLEMENT.

It was just 8:40 when young Clement got the word to go, but instead of darting off at breakneck speed to finish his fourth round he drove over to the side of the road and stopped his car. Then he descended, followed by his chauffeur, and looked at his engine with a mixture of disgust and despondency.



"De feet pipe," he said, in his imperfect English as an official approached him.

The latter walked over to the telephone, called up headquarters, and said:

"Clement, No. 12, has a broken feed pipe, and has pulled out of the control to repair it."

Both Clement and his mecanicien sized it up as a bad job. The former, who stood with goggles pushed up over his cap, had his face around the mouth covered with oily dust; and the contrast between the grimy spot and the white of the upper part of his face where the goggles had protected him was grotesque in the extreme. He surveyed the car for the space of fully half a minute, then said something quickly in French. Instantly the two men set to work. The mecanicien raised the bonnet, exposing the engine, while Clement brought out a couple of boxes filled with tools and odds and ends of all kinds. The pipe which fed gasolene to the carburetter was almost broken, one end just hanging by a thread. The mecanicien took it off and the two men selected a piece of rubber from one of the boxes and set to work to splice it to the pipe that was fast to the engine. It was a small job, apparently, but it took about twenty minutes, and the Frenchmen's looks showed plainly that they

Digitized by Google

regarded it as putting them out of the race for first place.

As it proved, this was Clement's only delay of consequence. Every other lap was made in good time, and it was only the accidents the other contestants encountered that later brought Clement into the first place which he lost to Heath on the last round.

HEATH WEARS HIS DIAMOND.

Clement was still at the control, on his fourth lap, when Heath entered it on his fifth round. While waiting for the signal to start Heath's mechanicien tinkered with the engine, adjusted a nut or two, and took off the cap of the cooler to see that the water supply was all right. He then made as if he would unfasten the bonnet, just as Heath said to the timer:

"How long have I?"

"Twenty seconds," replied the official.

"Assez!" cried Heath. "Sauter!" ("That will do; jump!") Each word was like the report of a pistol.

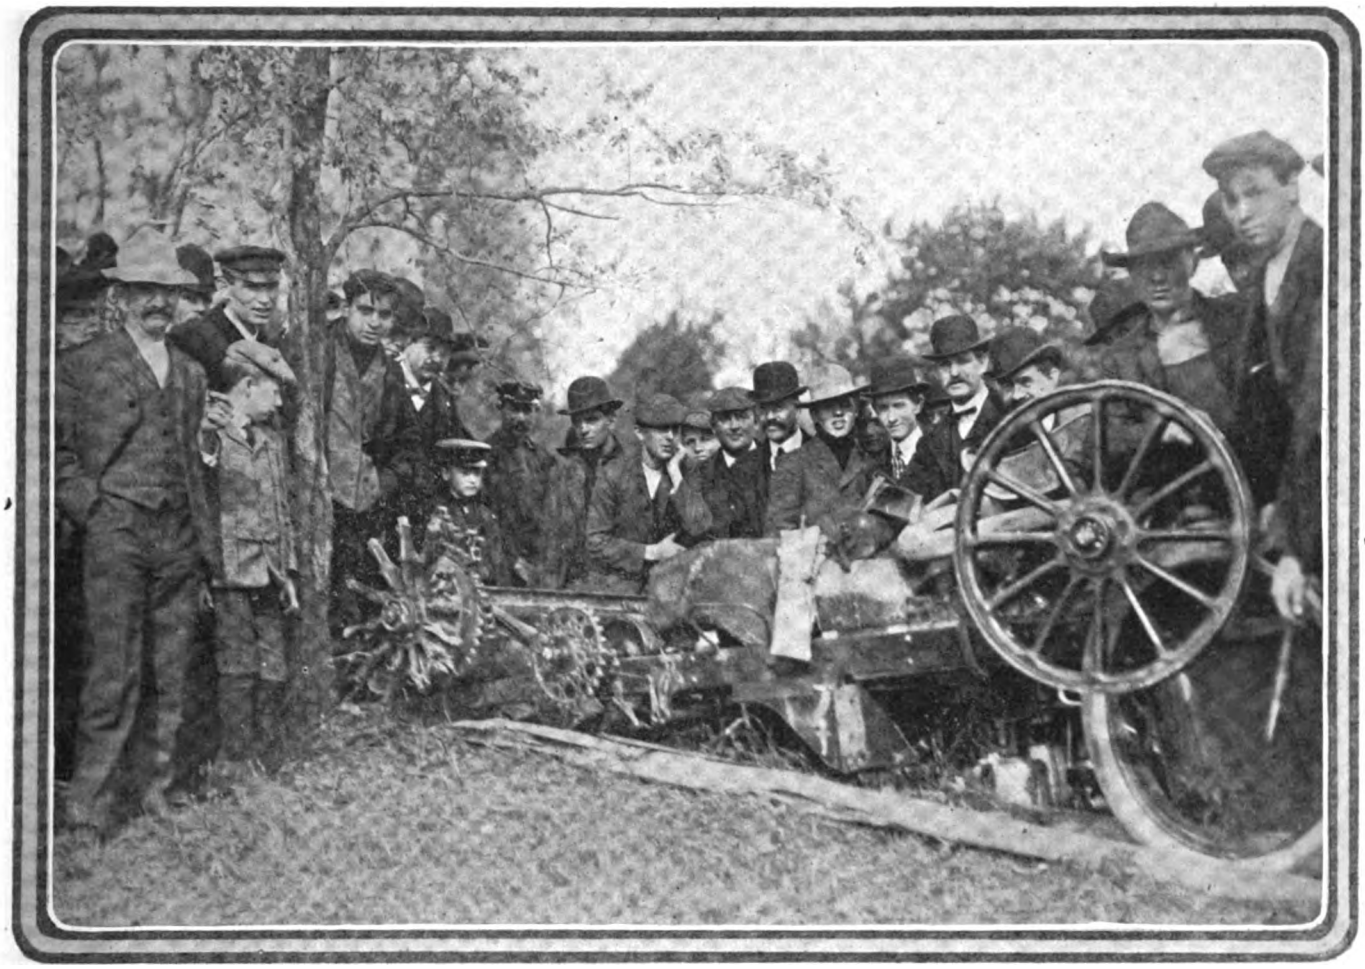
The mecanicien started as if he had been struck, dropped the bonnet fastening and hurriedly scrambled into his seat beside Heath. The latter sat quiet, but intent, waiting for the starting signal. His face and mustache were covered with dust, clear up to the goggles. A glimpse could be caught of a negligee shirt of mixed pattern, over which was a dust bespattered puff tie that had once been white; its folds were held in place by a diamond cluster pin. Around his neck the pendant ends half concealing the tie, was knotted a handkerchief. His hands were enclosed in gauntletted gloves, a check cap covered his head and his tall form was enveloped in a long coat, which just permitted a view of legs clad in plaid woollen golf hose. He was a picture of repressed energy and grim determination.

"Go!" cried the starter, and then a marvellous thing happened. The car leaped forward as if discharged from a catapault; on the smooth road immediately in front of the tape appeared as if by magic two straight lines of oily gravel, marking the course of the rear wheels. The Motor World man looked at the two little ridges of dirt dumfounded; there seemed something uncanny about it, a bit of necromancy that sent cold shivers cavorting along the spine. The car had disappeared in the distance, leaving its trail behind, caused, no doubt, by the suction of the tires when the power was applied with full force.

RUMORS THAT WERE AFLOAT.

The air was full of rumors of accidents. There was a bystander knocked down and fatally injured at the Queens turn. Over at Jericho a car had dashed off the road and killed both driver and mecanicien! A few miles west on the Hempstead road a car, said to be No. 5, had turned turtle and killed both men! So the stories ran, with no one to vouch for their accuracy.

THE TIRE AND SUPPLY MEN.



It was at the repair and supply tents of the various and automobiles represented in the race that the arrival of each car caused real action. To see the men rip off a flat tire, replace it and inflate it was a scene calculated to make men blink, but it was as nothing to the scene when a car arrived and supplies were necessary. It was seen at its best at Hempstead, where most of the tents were located, just outside the control lines. A dozen men would jump for the car as if to storm it. One had the wrench necessary to remove the tank cup, another held the funnel ready for insertion the minute the cap was removed; at his elbow was the man with the gasolene. Three other men performed similar service with lubricating oil, while other men stood ready with buckets of water for whatever purpose. It was an inspiring sight, and the French concerns, rich in experience, had their men well drilled, and their system acted like clockwork. Occasionally there were mixtures of French and American oaths and shouted orders, but usually every man knew his duty and performed it well.

THE DIFFERENCE IN FRENCHMEN.

It was at these places, also, that the calibre of the contestants came to the surface. Men like Clement and Teste were all excitement, and fretted and fumed volubly over the slightest hitch, while others, like Heath and Tart, were as cool as cucumbers. Tart, who had made great gains and seemed a likely winner, was unruffled even when it was found that his refractory clutch could not be repaired. He heard the news without demonstration, and accepted it like a philosopher. He said nothing, and sat down as calmly and unconcerned as if in his own house.

The road between Hempstead and Queens, while not so good as the Bethpage pike, was wider and sufficiently smooth for the racers to let out almost to their limits. On the left hand side of the road going towards Queens ran the trolley tracks, and it is typical of the

Digitized by Google

THE WRECK OF ARENTS'S MERCEDES.

disregard of danger shown that the line was in regular operation throughout the day. What might have happened had one of the swiftly moving trolley cars and a more swiftly moving motor car met at any one of the several sharp turns in the road is a speculation not to be relished. No accident of the sort occurred, however, and, as elsewhere, Providence watched over the crowd of pedestrians, cyclists and motorists who heedlessly made use of the road during the contest, and who massed at the dangerous Queens turn in goodly numbers.

THE ACCIDENT TO ARENTS.

The Arents accident happened on the second lap, and, as stated, the car turned completely over, pinning the chauffeur under it and crushing his skull so badly that he died shortly after reaching the hospital at Mineola, to which he was carried in the ambulance which forethought had waiting at the Queens corner. Arents himself was thrown clear of the machine, and he too was picked up unconscious and carried to the hospital. He remained unconscious until Tuesday, and, while badly hurt, his recovery is now assured.

What happened is largely conjectural. It seems probable that a burst tire or tires was the root of the trouble, and it is not entirely uncertain that the excitement under which Arents appeared to labor throughout the race was a factor in the case. How he ran into the curb at the Hempstead control, burst a tire and spilled his chauffeur has already been told. There is also in evidence an affidavit made by an attache of the Continental tire station at Hempstead, that on the fatal lap Arents arrived at that point with a flat tire, which the Continental men replaced. The affidavit recites that the connecting hose of the pressure tank burst, hearing which Arents and Menzel mistakenly conceived it to be the inner tube that had exploded; they waved the tire repairers aside, pulled off the good tire and put on another one themselves. Both men were all excitement, and so very anxious to make off that they did not wait to have the lugs properly tightened.

HEARD TWO TERRIFIC EXPLOSIONS.

One of the motor bicycle checkers a short distance outside Hempstead testified that he saw Arents stop in sight of his station and almost immediately make off. E. W. Wyatt, captain of the Alpha Motorcycle Club, who was also one of the checkers, located nearer Queens, appears to have been the official nearest the accident. It occurred just around a turn of the road where he was stationed. He states that the first suspicion of trouble that he had was the sound of two terrific explosions. He immediately ran to the scene and found the car overturned in the middle of the road, and pointing in an opposite direction from that in which it had been moving. Leaving the work of rescue to others, he at once repaired to the nearest telephone booth and called the ambulance. According to Wyatt, both rear tires were off, one of them, at least, being blown to bits. The lip of one of the rims was almost worn away, indicating that it had dragged tireless on the road for a considerable distance, bearing out what some of those at Hempstead claimed to have been the case, i. e., that Arents left Hempstead with one wheel minus a tire. These surrounding circumstances make it appear most probable that as Arents rounded the bend in the road and his tire or tires exploded, a wheel collapsed and he jammed on the brakes and caused the upset.

SPECTATORS SOUGHT GREWSOME SOUVENIRS.

When the crowd gathered at the scene of the accident the car still lay in the centre of the road, where a following car had difficulty in passing. So, after the two men were on their way to the hospital, a score of willing hands lifted it up and rolled it over and over, across the trolley track and up a four foot bank into a field. Souvenir hunters were soon at work, securing bits of wood and metal, to carry home as mementoes of the grewsome tragedy. All through the morning people along the course were on the lookout for stray souvenirs, and their richest find was in the shape of bits of tires that were discarded or blown off.

Digitized by Google

At the Turn in Queens.

That there was not a slaughter of the ignorant at the Queens end of the course partakes of the marvellous. If some of the silly motorphobes, who have been belaboring the Nassau County supervisors for "depriving the owners of the roads of their use" could have seen the way the populace literally swarmed over it at their own free will and pleasure on Saturday, they would have recanted—perhaps. For if there ever was an injunction disregarded and made farcical it was that laid on the people to "venture on the course at your own peril." In the first place, as all those really posted knew, there was no closing of the road to its habitual users; such prohibition would have been clearly illegal. All that was done was to request the people to keep off the roads. This request was utterly disregarded. For nearly a mile on the Hempstead road, an equal or greater distance on the Jericho road, and the few hundred yards of connecting highway at Queens, the racers drove between living, elastic walls, which opened just sufficiently to clear the oiled stretch of road and closed automatically immediately the car had passed. It seemed like sheer bravado; in reality it was ignorance, with a touch of American indifference and recklessness.

That the crowds were not decimated at some points was due to a variety of circumstances, among which luck played no small part. The drivers of the flying cars guided them straight and true, swerving neither to the right nor the left; the system of signalling was finely conceived and splendidly executed, so that ample warning was given of the coming of each car; and, lastly, the people had sufficient gumption to move quickly once the signal to clear the road was given. This happy combination of circumstances eliminated casualties; but there were occasions where it was touch and go, and where only by the hardest kind of work was the way cleared by the police.

POLICE HAD STRENUOUS MORNING.

The latter had their hands full. They passed a strenuous morning, and looked the worse for wear at the finish. At each of the Queens turns were stationed two mounted officers and half a dozen policemen on foot. When an oncoming car was signalled they began their endeavors to get the crowd back. With voice and strong arms they labored, always successfully, but often barely so. From 10 to 1 o'clock people came in droves—the majority of them city folks, but a number from the countryside. The former came in trolley cars, on foot and a few in automobiles; the latter in teams and on foot. They massed on the turns, sizing up the situation and then distributed themselves along the road.

The first turn at Queens was worse than its mate. It was a right angled turn, with the travelled road hugging the sidewalk closely and coming perilously close to a telegraph pole. On the outside of the curve several

ONE OF THE TELEPHONES.

wagon loads of sand had been dumped and spread over the turn so as to form a rude sort of banking. It was rarely needed, however, as the drivers had a wholesome respect for the turn and slowed down sufficiently to take the turn without trouble. In reply to the question whether all the racers took it so slowly, one of the policemen replied:

"All of them except Gabriel. Sure, he is the devil himself. He flies around here on two wheels and is gone before you can see him."

At the second turn the men pursued somewhat different tactics. They slowed before reaching the turn, swung wide, then quickened their speed and shot around very rapidly, opening wide the throttle as soon as they straightened out.

WHERE THE RAILROAD CROSSED.

Between the two turns, and much nearer the second one, the Long Island Railroad crosses the road at grade. The road is slightly depressed here, and the racing cars dipped down and shot up the next rise at a tremendous pace. The system of signalling at this point, as elsewhere, was beyond praise. At the first turn, already referred to, a man with a white flag was stationed; it was his duty to signal the approach of a car along the Hempstead road, and the signal was taken up by a man stationed midway between the first turn and the railroad. At the latter point were stationed two men, one having a white and a red and white flag to signal the oncoming car, the other, a railroad employe, having the familiar red and white bits of bunting with which he signalled the railroad trains.

The precautions taken to avoid a catastrophe were made plain at a little before 12 o'clock. An eastbound passenger train had stopped at Queens station and was ready to proceed to the next stopping place. The bell clanged and the big driving wheels of the locomotive began to revolve.

"STOP YOUR TRAIN!"

"Wait! A car is coming!" cried the signalman of the American Automobile Association to the railroad signalman. "Stop your train."

The red flag was waved at the train, which came to such a sudden stop that it brought passengers' heads out of the windows to see what was the matter. Meanwhile the A. A. A. signalman waved his red and white flag to show that the track was not clear; then, as soon as the train had come to a stop he substituted the white flag, and this clear signal was repeated by the signalman between the railroad and the turn and taken up by the man at the turn itself. In an instant the road was filled with waving white flags, through which a flying car sped rapidly. A second and a third car crossed the railroad before the stalled train was permitted to proceed.

The railroad men took a deep interest in the race. One of those employed around the station called to the operator in the signal tower, who was dividing his time between signalling trains and watching the space devourers:

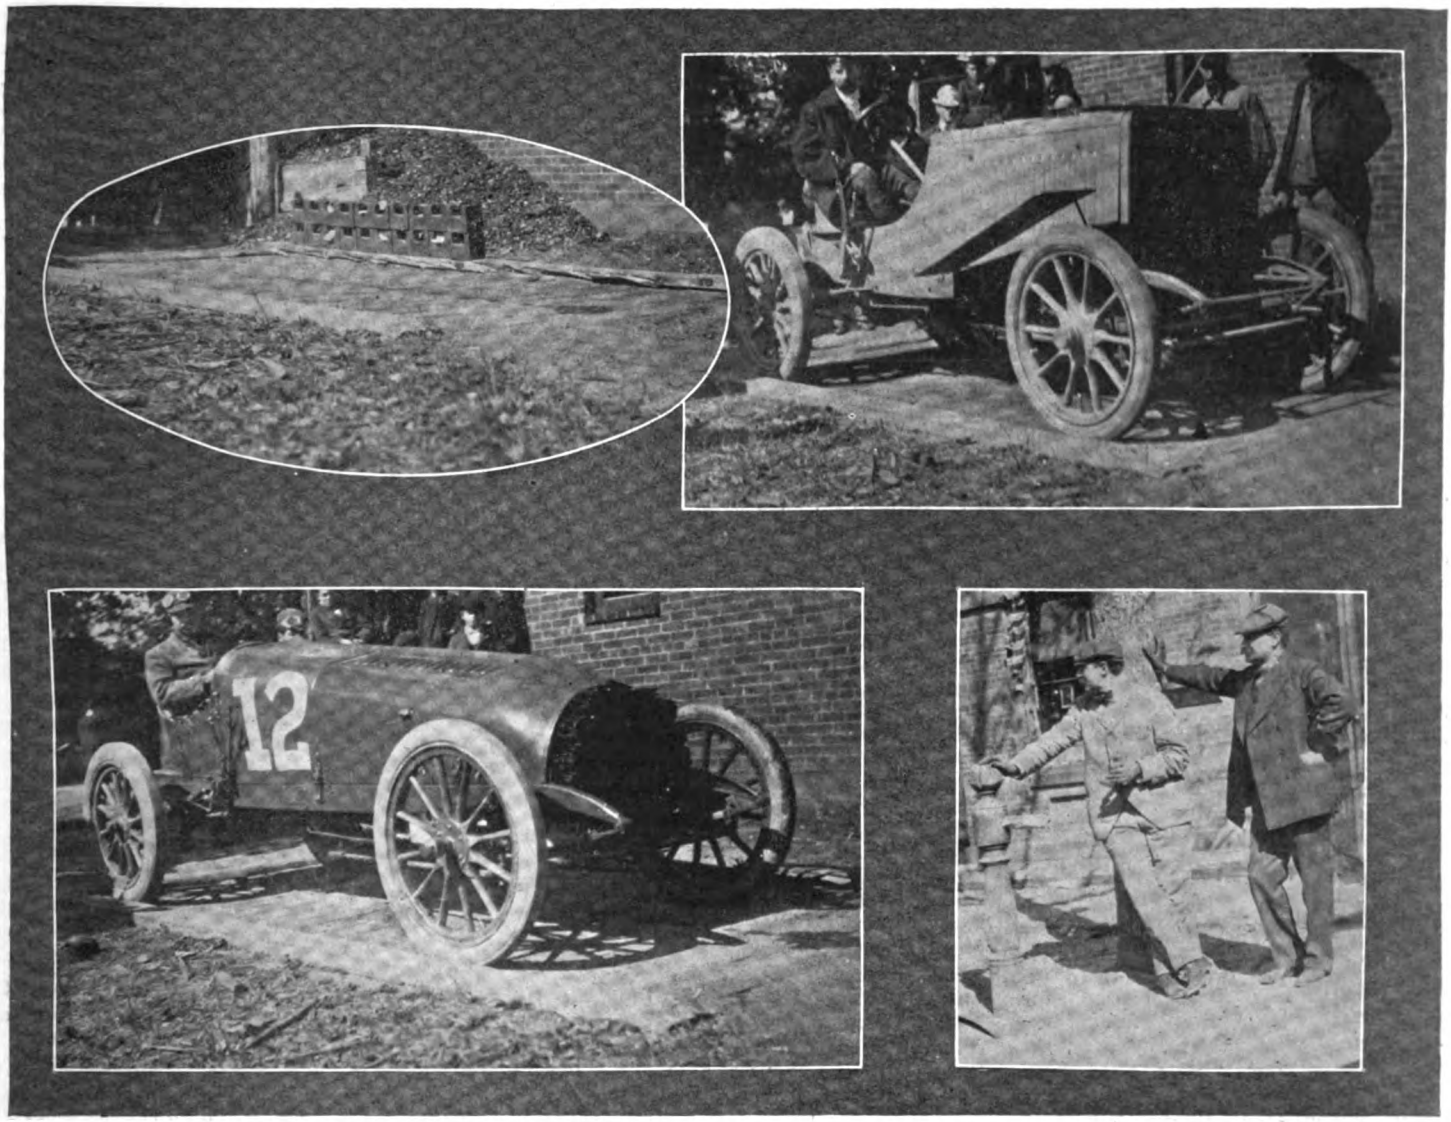
"How many do you make it are still running?" to which the tower man responded:

"I make it five. Is that what you have it?" Receiving an affirmative reply, he turned again to his work.

Over in the Continental depot, a few yards from the railroad, interest was still taken in the race after the Mercedes cars were all out. First place was certain to go to a car with a French tire, but it was the Clement that was favored. At this station there were pails of water containing cloths to be applied to heated tires, but no cars stopped there to make use of them.

At 12 o'clock the crowd had become enormous. It was apparent then that the race lay between Heath and Clement, and both men were cheered as they passed. The popular favor was with Heath, however, and he received salvos of applause.

On each of two of the corners of the second Queens turn there were churches. On trees in front of them were big placards in red letters reading: "Dangerous; keep off the turns." They might just as well never have been printed. Scores of people walked in the road, hundreds of others lined the turn and sat on the lawns in front of the churches. As each car went by there was a rush to see it, and it was as much as the policemen could do to open a fifteen or eighteen foot pathway for them. It was a good natured, heedless crowd, out for a holiday and bent on enjoying itself. That the middle of the road must be kept clear was recognized; but that there was any danger from the swerving of an unmanageable car did not seem to enter people's heads. By great good fortune no car got from under control, so this belief was not shaken.



"IN THE AIR" AT QUEENS.

Upon leaving Queens and entering the Jericho road a pretty good imitation of the "rocky road to Dublin" was encountered, minus the rocks. For about one mile this highway is within the limits of Greater New York, and, like most city roads, it presents an unpleasant contrast to the smoother and

THE SCALES IN THE COAL YARD.

HEATH ON THE SCALES.

CLEMENT "WEIGHING IN."

WEIGHERS RIKER AND BIRDSALL.

better kept highways of Nassau County. This particular piece of road was utterly unfit for the excessive speeding that was done on it. In places it was in waves; again there were holes and hillocks; over these the cars, pushed to the extreme limit of safety and sometimes beyond it, fairly bounded, touching only the high spots. As Joseph Tracy put it, the cars "were in the air most of the time"; when they came down it took sound construction and strong springs to withstand the shock; and driver and chauffeurs alike were required to hold on like grim death itself to escape being jolted out. The wonder is not that springs were broken and so much other damage inflicted, but that any of the cars emerged scathless from the terrible ordeal.

It was on this stretch that Heath had his tire trouble which so nearly put him out of the race. The 60 horsepower Pope-Toledo was also put out here. The driver, A. C. Webb, had put on speed upon leaving Queens, when his car bounded from one hummock to another until he realized that his control of the steering was gone. Mindful of the danger of jamming the brakes on suddenly, he applied them gently in hope of stopping. Finding that he was heading straight for a tree, however, he jammed on the emergency brake; the car skidded, struck the tree and went into a ditch. The mecanicien jumped, and Webb landed, catlike, on all fours. The car was badly damaged, but the men were unhurt.

RUMPUSES AT THE WEIGHINGS.

Young Clement made things interesting at both the "weighing in" on Friday and the "weighing out" immediately after the race.

The scales were located in a Garden City coal yard, and several days before the weighing James L. Breeze, of the Cup commission, found that they were the typical coal man's scale. They weighed 28 pounds over in the thousand. As a result they were officially adjusted and the beam set at the weight limit of the cars—1,000 kilograms, or 2,204 pounds. When Heath and Clement learned on Friday that it was the intention to take their cars from them and keep them under lock and key overnight, there was a mighty protest. Heath said decidedly that he would not submit to the rule, which had been adopted a week previous. He did not purpose permitting his car to leave his possession. He would pack up and go home first. Clement said the same thing, but took many more words to say it, and lashed himself into a great state of excitement. The official measurers, A. L. Riker and E. T. Birdsall, had no voice in the matter, but finally carried the matter to the race authorities. Heath and Clement refused to recede from their decision and protested against the imposition of a rule of which they knew nothing. A compromise was effected by the adoption of a "weighing out" rule. The finishers were required to present their cars after the race for weighing.

The actual operation of weighing in was marked by one other incident. A cute young American who doubted the weight of his car removed its reversing gears, and when Mr. Riker ordered him to reverse was considerably embarrassed and stammered a very lame excuse.

The weight of each car was not taken. Each

Digitized by Google

in turn was run on the scale, the beam of which had been set to 2,204 pounds. If the beam was not depressed it was evident that all were within the limit, as proved the case.

At the weighing out, of course, only Heath and Clement presented themselves. Heath conducted himself like a quiet and dignified gentleman. Clement acted like a schoolboy or a hen with its head off. When Heath's car was on the scale he demanded to see its exact weight. Measurer Riker had passed it as O. K. and had verified the seals that had been placed on the several parts at the weighing in, but the excitable little Frenchman and his jabbering retinue were not content. They prattled like a lot of parrots with high-speed tongues. Riker's face was livid with rage that his word should be doubted. If he had presented one or more of the excited Frenchmen with an uppercut on the chin or given them a jab in the stomach none would have been surprised. He contained himself, however, and finally called on Chairman Pardington, who refused to interfere. The Niagara of French and the waving of arms were then resumed with redoubled energy. But Riker held to his position, and Clement was still jabbering like a crazy man when he left the spot. Incidentally, Clement's car was not "weighed out" at all.

THE OFFICIALS OF THE RACE.

These were the officials of the course:

Referee—W. K. Vanderbilt, jr.

Judges of start and finish—Harlan Whipple, president A. A. A.; Frank G. Webb, president L. I. A. C.; Winthrop E. Scarritt, president A. C. of A.; W. C. Temple, president P. A. C.

Judges of control—Hicksville control, G. Von Wagner, jr., and Peter Grupe, Hempstead control, H. C. Hackstaff and John D. Hackstaff, jr.

Judges of turns—Jericho, William Milne; Plainedge, Theodore Heilbron; Queens-Hempstead, R. Healy; Queens-Jericho, Frank L. Evans.

Judges of weighing in—E. T. Birdsall, A. L. Riker.

Timer—S. M. Butler, A. C. of A.

Starter—C. H. Gillette, secretary A. A. A.

Assistants to starter—George E. Farrington, A. C. N. J.; Emerson Brooks, A. C. A.; M. M. Belding, jr., A. C. A., Robert Lee Marshall, A. C. A.

SOCIETY PRESENT IN FORCE.

Officialdom and society were both well represented in the grandstand and along the course. Mayor McClellan was present, driving down in an automobile, accompanied by Commissioner of Street Cleaning Woodbury. His Honor watched the race for some time, and seemed to take a keen interest in it. Later in the day he was entertained by Mr. and Mrs. Egerton Winthrop, jr., the Mayor being Mrs. Winthrop's brother-in-law. President Harlan W. Whipple of the American Automobile Association and President Winthrop E. Scarritt of the Automobile Club of America both had parties of friends at the course.

In the person of "Willie" K. Vanderbilt, jr., donor of the cup and the one chiefly instrumental in promoting the race, the official—he was, of course, referee—and the social luminary were joined. He was here, there and everywhere, the observed of all observers. Sartorially he was a marvel; his rapid changes of garb will linger long in the minds of those who witnessed them. In Mrs. "Willie K." the cup donor had an able and willing coadjutor. No person present took greater delight in the proceedings than she, or evinced her pleasure in more vociferous fashion. Her head, crowned with a red picture hat, and her face, flushed with excitement, she was the most lively person in the grandstand. She led the cheering and the handclapping—when there was any. When Heath flashed by at the finish she jumped up on a camp chair and waved her hands rapturously.

Of the other society people, the Long Island colony—and the Meadow Brook set in particular—were most numerous. The races at Morris Park, the horse shows at Tuxedo and Morristown and other social functions prevented many people from attending. In the boxes and stands were such well known automobile enthusiasts as Colonel John J. Astor, who arrived late; Mr. and Mrs. O. H. P. Belmont, who had a large house party at their residence and entertained them at a function which broke up at daylight, so as to give them time to get over to the start; Mr. and Mrs. Harry Payne Whitney, Mr. and Mrs. Victor Sorchon, Mr. and Mrs. Sidney Dillon Ripley, James L. Breese, Mr. and Mrs. Foxhall Keene, and Alfred G. and Harold Vanderbilt. Many of these people never left their seats from just after daylight until the race was finished. In a number of cases servants served refreshments in the shape of coffee and sandwiches at about 9 or 10 o'clock in the morning; and such people as Mrs. W. K. Vanderbilt, jr., Mrs. O. H. P. Belmont and Mrs. Herman Oelrichs nibbled and drank unceremoniously between cars. Wet goods—bottled beers, whiskies, etc.—were also passed around in the early morning to keep the cold out.

THE TRADE WELL REPRESENTED.

Thomas B. Jeffery and George W. Bennett, of T. B. Jeffery & Co.; M. J. Budlong and F. C. Armstrong, Electric Vehicle Co.; George H. Day; R. D. Chapin, Olds Motor Works; Harold O. Smith and President Prenner, Premier Motor Mfg. Co.; Bert York, B. F. Goodrich Co.; Wm. E. Metzger, Cadillac Automobile Co.; Henry Ford, of Ford Motor Co.; Arthur Philip, Morgan & Wright; D. J. Post, Veeder Mfg. Co.; E. E. and Edgar Apperson; L. A. Hopkins, Brooklyn Automobile Co.; Harry G. Fisk, Fisk Rubber Co.; President Shirmer, J. A. McCrea and Archie McLachlan, Royal Motor Car Co.; W. S. Gorton, Standard Welding Co.; L. P. Kittredge and L. P. Mooers, Peerless Motor Car Co.; W. A. Gray and F. E. Castle, of Gray & Davis; L. J. Keck, Badger Brass Mfg. Co.; George Worthington, jr., and W. J. P. Moore, Worthington Automobile Co.; Walter and Harry Allen and Mr. Halle, Allen, Halle & Co.; F. A. La Roche and A. J. Picard, Am. Darracq Automobile Co.; George Weiss, of Cleveland Car Specialty Co.; S. T. Davis, A. L. Riker, the Locomobile Co. of America; W. B. Miller, O. J. Woodard and P. Bradley, of Diamond Rubber Co.; Windsor T. White and Rollin White, White S. M. Co.; M. L. Goss, of Baker M. V. Co.; Orlando F. Weber, of Chicago; Arthur Pope, A. L. Pope, jr., and Charles E. Walker, Pope. Mfg. Co.; A. H. Funke; Arthur Hyde, Whitlock Coil Pipe Co.; Percy Owen, Winton Co.; S. D. Waldron, sales manager, Packard Motor Car Co., Detroit; J. S. Bretz, Corbin Motor Vehicle Corp., New Britain, Conn.; E. R. Thomas, president, E. R. Thomas Motor Co., Buffalo; J. D. Anderson, vice-president, Hartford Rubber Works Co., Hartford; H. A. Githens, G & J Tire Co., Indianapolis; A. E. Schaaf, Pope Motor Car Co., Toledo; L. B. Gaylor, general manager, Waltham Manufacturing Co., Waltham, Mass.; Charles E. Miller, New York; H. A. Lozier, jr., Lozier Motor Co., New York; J. W. Bowman, sales manager, Fisk Rubber Co., Chicopee Falls, Mass.; H. P. Maxim, Electric Vehicle Co., Hartford, Conn.; Henry Souther, Hartford, Conn., and John C. Spiers, general manager, Autocar Co., Ardmore, Pa.; Harry Fosdick, Boston; George H. Lowe, Boston; C. E. Whitney, Hartford.

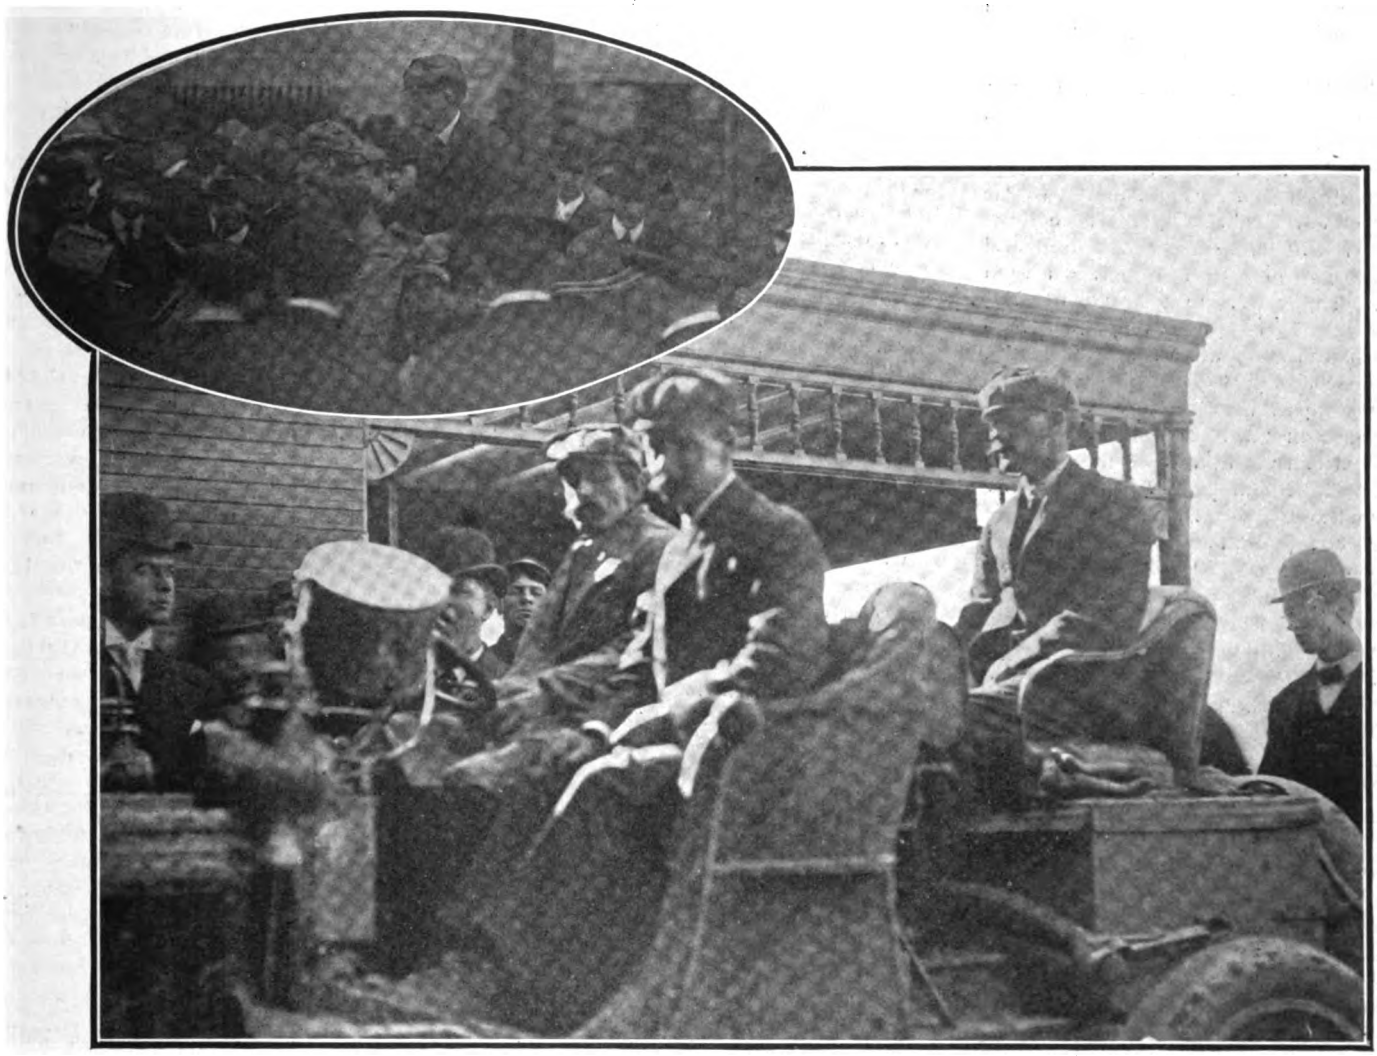
ABOUT HEATH, THE WINNER.

George Heath, the winner of the race, is a man of means who has been an enthusiastic automobilist since motor vehicles were introduced. He gained distinction this summer by winning the Circuit Ardennes of France, a road race of 375 miles, without a stop. Clement finished third in this race.

In an interview after the contest Heath, who is a strapping man a little more than six feet in height, with the droop of an Englishman, said that this race, despite the many turns, was not so trying as the Circuit Ardennes, because the two controls and ten laps gave a driver twenty chances to rest.

He explained the fast time as due to the absence of hills, but said the course was not so good as those of France. He also said that he did not run at full speed all the times he could have, from fear of killing some one, but let out when on the last lap, because he heard at a control that Clement's time was better than his. Mr. Heath was born in Astoria, L. I., forty-two years ago. When asked how long he had lived abroad he answered:

"I am ashamed to say that it is fifteen years."



While driving the car the only sustenance he had was a few raw eggs eaten in the controls. Save two tire troubles, his car sustained only a broken spring. He said he rather expected to break all of them.

Albert Clement is only twenty-one years of age, and his only other performance of note was winning third place in the Circuit Ardennes. His father is the well known manufacturer of the Clement-Bayard cars, one of which the son used.

Columbia Crew Cracks Chicago-New York Record by more than 14 Hours.

ARRIVAL AT THIRTY-NINTH STREET, NEW YORK.

CROSSING THE HUDSON ON THE WEEHAWKEN FERRY.

As was predicted in last week's Motor World, the Columbia car is once more the holder of the Chicago-New York record. The much coveted distinction was won on Thursday, October 6, when Bert Holcomb, driving the 30-35 horsepower Columbia car, reached Weehawken at 1:35 p. m., and the store of the Electric Vehicle Co., Thirty-ninth street, New York, ten minutes later, making his elapsed time 58 hours and 35 minutes at Weehawken and 58 hours and 45 minutes at New York. These figures replace those made last August by Ellis and Schmit, viz., 72 hours and 46 minutes.

The record breaking journey was signally successful. It was carried through almost exactly as planned, the schedule laid out being followed with remarkable fidelity, with the finish coming a little more than an hour ahead of the sixty hours called for. But for several times straying from the road owing to bad piloting, thereby losing a lot of valuable time, the record would have been still further cut. The big slice carved out of it last week seems destined to preserve it from further attack for this season at least.

The 1,108 miles between Chicago and New York—as shown by odometer measurement—was covered by Betsy II, as the car was dubbed by its crews, without engine or other constructional troubles of any kind, save those connected with tires. Three punctures and one cover replacement, necessitated by its being cut by a stone, constituted the sum total of these. The repairs were quickly made, the new Dunlop detachable tire, which was used, proving itself susceptible of very rapid manipulation. From twelve to fifteen minutes was all that was necessary to take out the inner tube, insert a spare one, replace the cover and inflate. In addition to the slight delays from this cause there was a delay of an hour and five minutes in Buffalo, and three hours were lost between Cleveland and Binghamton through straying from the road. The actual running time was 51 hours and 5 minutes, an average of 21 2-3 miles an hour.

The start was made from the Chicago Automobile Club house at 2 a. m. on Tuesday, October 4. The route lay through South Bend, Cleveland, Buffalo, Elmira, Binghamton, Kingston and Weehawken. Two entire nights and part of a third were consumed in the running, the car being driven through day and night. The driving was divided into four stages, and three crews took turns at them. Holcomb began the journey, and covered the stage from Chicago to Cleveland, a distance of 382½ miles, which was covered in 15 hours and 35 minutes; then Lawrence Duffie took the wheel, and did not relinquish it until Buffalo, 208 miles further, was reached, this run being made in 11 hours; at Buffalo (his home city) "Eddie" Bald took charge, and got the car to Binghamton, 225 miles, in 19 hours and 32 minutes; here Holcomb again assumed control, and brought the car to Weehawken, 265 miles, in 16 hours and 45 minutes.

The fastest run of the trip was made from Chicago to South Bend, Ind., a distance of 110 miles. This was covered in 3 hours and 35 minutes, an average of more than 32 miles an hour. The car was travelling faster than this, in spite of its being pitch dark, but when thirty-two miles out of Chicago Holcomb, who was worn out by worry and loss of sleep owing to the unsuccessful attempt of the day before, dozed, and before he could recover himself ran the car into a ditch. No injury was done, however, and

Digitized by Google

the car was driven out to the road and the journey resumed. That he did not lose any time, however, is proved by the fact that he averaged 24 miles an hour to Cleveland.

The record breakers were favored with good weather for the greater part of the distance, and but for sand between Cleveland and Buffalo would have called the roads good. Upon reaching Binghamton, N. Y., heavy rains were encountered, which made the roads heavy and slippery. The fact that this stage was taken at night added to the difficulty of covering it. By the time Newburg was reached the rain had ceased and the roads began to dry. Before Weehawken was reached they were in good condition.

It was just 1:35 p. m. on Thursday, 58 hours and 35 minutes after leaving Chicago, that the car driven by Holcomb drove up to the ferry slip at Weehawken, where a special boat was in waiting. A car containing Manager Armstrong of the Electric Vehicle Co.'s New York branch and other Electric Vehicle officials, and also a Motor World man, had been driven to Weehawken to meet the voyagers. It proceeded several miles up the road, and had stopped at a roadhouse to telephone for news of the car when suddenly the latter hove quickly in sight and was gone in a flash. There was a hurried scramble into the waiting car, which set out in hot pursuit, and the ferry slip was reached just before the lines were cast off. A quick passage across the river was made, and Thirty-ninth street reached ten minutes after leaving Weehawken.

Holcomb and Duffie are old hands at the record breaking game. They piloted the 24 horsepower Columbia car from Chicago to New York in September, 1903, when the distance was made in 76 hours. This was cut to 72 hours and 46 minutes in August last by Ellis and Schmit.

The car used on the present trip was a 30-35 horsepower four cylinder Columbia car, fitted with the new American Dunlop tire. A Whitlock cooler was fitted, and worked splendidly throughout the run. The same is true of the Whitney chains, with which the car was equipped.

After the completion of the run a dinner was given to the participants and a number of guests by the Electric Vehicle Co.

To Check a Car on a Hill.

If for any reason a motorist should miss his gear or stop his engine in ascending a hill, and his brakes refuse to hold him from running backward, his best plan is to steer to the near side of the road, holding the brakes as hard as he can, then, if the momentum of the car is not too great, bring the rear of the car right round in the road so that it faces uphill. Even if the road is not wide enough to make the complete turn, his car will be stopped by running backward ito the fence, and no great damage will be done.

Looking After the Ninety-nine.

City Auditor Noble, of Columbus, Ohio, has issued 227 automobile licenses. It is estimated that there are 90 more automobile owners who have not registered.

KANSAS CITY'S POOR SPORT

Small Attendance, Squabble and Cold Weather Combine to Hurt Race Meet.

The six hundred spectators who journeyed to the Kansas City (Mo.) Driving Park on October 5 to witness an automobile meet came away with only a half pleasant impression of the sport. There was one good contest—that between Webb Jay (White) and Will Goodrich, the local crack, who drove a Ford, in which the latter came out first best. These two drivers accounted for nearly all the prizes given. In the motorcycle race the men refused to start until they saw the prizes; in the end a compromise was reached, and the promoter deposited $25 as a guarantee that they would be forthcoming.

Webb Jay, the only out of town driver to attend, and who won three races with a regular White stock car, drove with an ease which astonished the spectators. He "seldom had more than one hand on the steering wheel, and seemed to spurt at will." The five hundred spectators got cold between the races, and the most faithful were restrained from leaving only by the comfortable picture of Jay sitting on the warm boiler of a White with steam curling about him. Summary:

Five miles, for vehicles from 881 to 1,432 pounds—Webb Jay (10 horsepower White), first; E. P. Moriarty (7 horsepower Stevens-Duryea), second; Will Goodrich (10 horsepower Ford), third. Time, 9:40.

Three miles, for vehicles from 1,432 to 2,204 pounds—Webb Jay (White), first; D. L. Whitford (10 horsepower Franklin), second; Ralph Baker (White), third. Time, 5:43 1-5.

Five miles, for motorcycles—Charles Dinklege (1½ horsepower Indian), first; A. O. Brooks (Indian), second; Walter Lindell (3 horsepower Marsh), third. Time, 8:32½.

Three miles, free for all—Will Goodrich (Ford), first; Webb Jay (White), second; D. L. Whitford (Franklin), third. Time, 8:50.

Three miles, for vehicles from 881 to 1,432 pounds—Will Goodrich (Ford), first; Webb Jay (White), second; D. L. Whitford (Franklin), third.

Three miles, for motorcycles—C. C. Hahn (Indian), first; Charles Dinklege (Indian), second; Walter Lindell (Marsh), third. Time, 5:10.

Five miles, match race between Webb Jay and Will Goodrich—Won by Jay (White); Goodrich (Ford), second. Time, 9:11.

A. C. A. Reception to Foreign Cracks.

Of the foreign racing men, in whose honor the function was held, Albert Clement alone was present at the smoking concert given by the Automobile Club of America at their clubrooms in this city on Tuesday night. George Heath, the winner of the Vanderbilt Cup, had sailed that morning on the Kaiser Wilhelm der Grosse, while Gabriel, Teste and Tart were engaged in sightseeing prior to their departure for France the next day. The presence of Clement, Frank Croker, E. E. Hawley, H. H. Lyttle and A. C. Webb, however, gave the affair a distinctive race flavor, each of those mentioned being heartily cheered.

President W. E. Scarritt opened the proceedings with one of his characteristic speeches, in which, after deploring the public clamor against automobiles, he launched into one of his eloquent flights eulogistic of the self-propelled vehicle. Continuing, he dropped some hints concerning the 1905 Vanderbilt race, which he seemed to regard as a certainty, and intimated that it would again be run on Long Island roads. He made light of the obstacles which were put in the way of this year's contest, saying it was beneficial in the same way that "a few fleas are good for a dog, to make him active."

Clarence Gray Dinsmore, the club's foreign representative and a great patron of road racing by proxy, spoke, commending American cars, which, he said, had made an excellent record for reliability, if not for speed, in the cup competition. He hoped American manufacturers would feel sufficiently encouraged to build cars for the next international cup race in Europe.

He then told of the great preparations being made by Germany to regain the international cup. For the first time, he said, the Mercedes makers are building special racing machines for the event, and he predicted that all former speed records would be smashed by them.

After a few more speeches, the entertainment proper, consisting of a smoking concert, with monologues, and supper, was inaugurated. There were about seventy-five members and their friends present.

Price Handicap Brighton's Feature.

A handicap race with the starts allotted entirely on price will be a novel feature of the forthcoming race meet to be held on the Brighton Beach track, this city, on October 22. The event is open to all cars selling at $1,000 or less, and a car will be given a yard handicap for each dollar that is costs less than the $1,000. Cars that sell for $1,000 will be on scratch, while an $800 machine will be given 200 yards start. The distance will be a mile.

Among the other events is a mile dash for touring cars for the Coney Island Cup, in which each car will be required to carry three passengers, and the operator must crank the machine after the word "Go!" is given; a two-mile race for the Amateur Championship Cup; a free-for-all event, in which cars must be driven by their owners; the International Cup race, with heats at three miles and a five-mile handicap, open to all.

St. Louis Buys Vehicle Licenses.

Contracts have been let by the St. Louis (Mo.) officials for 64,000 vehicle license plates, to cost $2,426.50. They are divided as folows: 1,500 automobile plates, 5,000 bicycle plates, 25,000 dog plates and 12,000 one-horse wagon plates.

COACHMAKER AS CRITIC

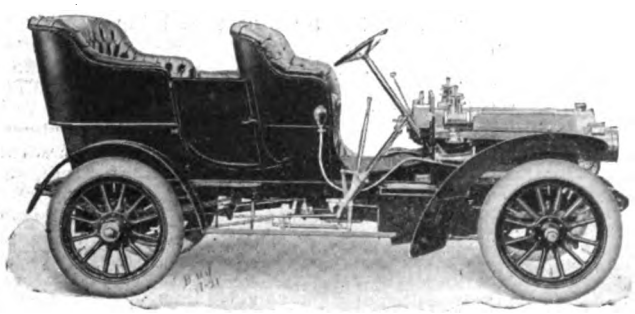
Britisher Discusses the Automobile and Finds Many Things That Displease Him.

Notwithstanding their early aloofness, carriage makers are watching the automobile industry with increasing attention. This is only natural, in view of the fact that, up to the coming of the automobile, they virtually controlled the manufacture of road vehicles. The experience of centuries has placed them in a unique position with respect to constructional details. Consequently any criticism of the automobile as a road vehicle, aside from its driving mechanism, is both timely and interesting. Such criticism is contained in a paper read before the Congress of the Institute of British Carriage Manufacturers recently by J. Boarland, excerpts from which follow:

"The best horse drawn vehicles have been produced, but the people want to go faster, unfettered by rail tracks or tramways. The motor car has come to stop because it goes faster than horses, and humanity desires to go faster. There will, perhaps, be a great many horsedrawn carriages used in the future; some may be displaced by the motor car, but the number of drawn and propelled vehicles owned by those whom we call carriage people is likely to remain the same, and in addition, there will be the probable demand for the middle classes, who are likely to find something within the reach of their income. There is nothing to alarm the coach maker in this evolution, except he has a rooted conviction that the world is at a standstill. There is money in it, and coach makers can cater for it. We have centuries of experience and good taste to help us, and it only remains for us to study how to keep our own work in our own hands.

"We have instinctively copied the parabolic curves of the most graceful of animals. Coach makers have for generations kept to this ideal. Only once did they depart from it, when some ingenious vandal (probably thinking to cheapen production) discarded sweeps and substituted straight lines. The straight line craze caught on, until it was found that other wood workers, with half the coach maker's experience and none of his good taste, could bolt together a number of straight pieces of wood into the form of a box, mount it upon elliptic springs and call it a dog cart. This was utility without beauty, and in a few years we had lowered the public desire for good design. The railway carriages on most lines furnish an example of utility without beauty. The production of the motor car is largely a question of design. The engineer's draughtsman is ready to produce something made up of straight lines and circles. He frames his work strictly in accordance with the parallelogram of forces with a few arcs of circles thrown in. He can construct a frame upon which sheets of metal may be placed, and strips of wood nailed on the latter for mouldings. Stresses are his first consideration, gracefulness comes second.

"The present time may be considered the iron age of the motor car. Coach makers have been familiar for years with the suggestion to substitute various metals instead of wood for panels. The idea has been condemned again and again, only to be reiterated by some one else, and in connection with this new industry it has actually taken shape, and we have not only metal panels, but in some cases metal frames also. The reasons for condemning panels of this description are many. The thin metal shows the battens which are inserted in the frame to give rotundity of appearance. They are easily bent or buckled. In the case of sheet iron, they rust through under the trimming, and they add to the vibration of the car. With mild mahogany panels the shape can be neatly rounded and the battens are not seen through them. When properly filled up they give a good foundation for highly finished coach painting. They are stronger than metal panels. The difference in weight between mahogany and sheet iron is trifling. Panels may be shaped in mahogany to such designs as would require templets in the case of metal, and instead of being planted on strips of wood tacked on for mouldings, showing all the nail heads, proper English ash framing can be made without nail heads to be an eyesore, and with very few joints visible. The wings of a motor car when made of sheet iron are noisy; not even the raised border milled round them stops the drumming sound. The same material should be employed in motor bodies as coach bodies are made from, viz., wood, and I will be glad to hear what the exponents of metal panels have to say in their favor. I believe that the best way to make a carriage perfect is to try to remedy its defects. In this paper I will only point out a few defects, but will not suggest remedies. We will begin at the back of the car, and the door of the tonneau must be voted a nuisance when it does not shut properly. How many coach makers in this institute would dream of sending out a wagonette with a door which would shut so badly as that of the ordinary armor plated tonneau motor body? The coach maker who does not forsake the principles of construction used in his trade can make a body the doors of which will open and shut properly. The dash, upon which the bonnet hinges, is often an inferior piece of wood, utterly unfit to carry the number of articles which are bolted upon it, and soon succumbs to the heat from the engine. The steps are poor and badly placed. The engineer takes upon himself the selection and the placing of the steps upon the frame, with the result that they are similar in design and general inconvenience to those upon a locomotive engine. The coach maker has spent many hours of his working life in spacing the height from the ground to the bodies of the carriages which he builds, in considering the proper size and shape of the treads, in booting them and in rendering them safe, so that the carriage user may enter and (what is equally important) may alight in safety, whether in the day or night.



"The bucket seat has its advantages. It separates the servant from the owner of the car, and it gives support to the sides of the occupant, as well as to his back. The angle of inclination may be right for a car running at thirty miles an hour, and for fast touring cars perhaps it is best, but for the smaller cars and for such persons as do not care to go fast, I am inclined to think that the strained, anxious looking forward position hardly gives that idea of comfort which one is likely to associate with people who are enjoying their ease and the scenery at the same time. The canopy of the touring car may be made dainty or clumsy, according to the taste of the builder. The curtains, which are hung on rings sliding upon a rod attached to and under the roof, and which are gathered round the standards and tied much after the style of a cotton umbrella, may be effectual in keeping out the storm, but I must intrude my personal opinion and state that they do not look smart. The curtains which are cut to the rounded shape of the car and are made to hang without wrinkles give the canopy a more dignified appearance. The sliding wind shield perhaps gives the coach maker most trouble. After he has made it to work properly and fitted so that it will not rattle either when down or under the roof, he finds that the dainty French fasteners which keep it in position are badly fitted in themselves, and make noises when the car is running. Might I appeal to those members who belong to one of the accessory trades to produce a fastener which will not rattle; something which may be turned with the wrist and not with the thumb and finger?

"With regard to the trimming and painting very little can be said, because the taste of the purchaser has to be consulted. Personally, I think that in a climate where from October till April the sun is but an inconstant visitor, bright warm colors are preferable to deep cold shades. Human nature is paradoxical, for we see the carriage users who in times gone by complained of the slightest noise in their carriages now taking no notice of such things when driving in motor cars. Motoring is new, but when the novelty has somewhat worn off it is not improbable that noisy doors and windows, and the various things which were found fault with in horse drawn carriages will be commented upon by the users of motor cars. When that time comes some of the attention which is now centred upon the engine will be diverted to the body, and a good body will be considered as essential to a motor car as a good engine now is. To sum up, the British coach maker in building motor bodies should keep to his old ideals of good workmanship and graceful designs, of utility coupled with beauty. He should model them on the shapes used so long in horse drawn carriages and build them of similar materials."

Peerless

The Car of Achievement

Supreme in every day use as in public contests.

A Peerless owner in Detroit after a long Canadian tour writes us: "I never thought it possible to make a motor that would give such absolute satisfaction."

From far off Montana comes the following: "We have just returned from a trip into the Salmon Country, spending some ten days there. On this trip, we crossed the Continental Divide, over 7,000 feet high. . . . We experienced absolutely no trouble with the machine."

After a 1,000-mile trip through Wisconsin, a Milwaukee owner writes: "I have nothing but praise for the Peerless car and am proud of owning one."

Toledo Club Has a Joke Map.

Members of the Toledo Automobile Club are having considerable fun at the expense of the committee that was appointed some time ago to furnish road maps of the country adjacent to Toledo.

It appears that the committee engaged an engineer to do the work, and the latter charted the map from a government survey that was anything but accurate, the result being that there are a number of roads on the map that do not in reality exist at all. Besides this, some of the roads that are charted "lead to nowhere" and are nothing but blind lanes.

The other day one of the members of the club bravely started out, confident in his ability to penetrate all the recesses of the country, for he had one of the maps securely tucked away in an inner pocket.

After he had got some distance from Toledo he pulled out his map, so it is said, and decided to take a certain road that was marked therein and which was supposed to lead him to Stony Ridge. He had not proceeded far when the highway began to assume all the aspects of a lane, and the traveller, almost before he knew it, was brought up into a farmer's barnyard. Another member of the club followed one of these "roads" for some distance, only to find himself in a field surrounded by cows.

The maps cost the club somewhere in the neighborhood of $200, and some of the members are wondering whether it is really a joke, after all.

Side Entrances for Short Chassis.

The question of mounting body work on short "chassis" in such a manner that side entrances are possible, has been occupying the attention of most of the leading Paris coachbuilders. The long frame has been found so unwieldy in crowded thoroughfares, so awkward at taking corners, and to some people, so expensive, that there has been almost a unanimous demand for some style of body capable of being mounted on the ordinary short "chassis," and yet at the same time permitting the introduction of the now essential side entrances.

To solve the promiem, the Paris firm of Kellner has devised an appliance, which it is about to introduce. It is an extensive modification of the old "siege tournant," and the first is being fitted to Frank Munsey's 18-horsepower Mercedes. In order to obtain access to the rear part of the vehicle, it is only necessary to open a small side door. This, in opening, forces upwards by means of angle pinions the driver's seat, giving a clear entrance to the back seats, if on an open body, and to the interior if closed.

Autos Affect Price of Horse Flesh.

Dealers in horseflesh are said to be feeling the effect of the automobile in many ways. The dropping off of sales in high-class coach and carriage horses is felt seriously. Customers who annually bought spanking, high-priced teams are scarce, and that class of people are restricting their purchases to an occasional animal for station use or a saddler for a constitutional through the park. It is the opinion of many of the horse dealers, however, that the automobile craze, like the bicycle exodus of a few years ago, has reached its limit, and will in time revert back to team driving.

Dealers report a fair demand for saddle and general business horses, but prices are low and may continue so during the winter months. The bottom has dropped out of "speed" sales, and prices are ruinous to the dealer who goes West and ships his horses East, expecting big profits.

Branford Re-enters Racing Field.

The management of the Branford (Conn.) fair are contemplating the addition of automobile races this year. If the effort to add such races is successful—and of course the number of entries in a large measure will determine that point—one day of the fair will likely be devoted to them.

Most people have forgotten it, but it was at Branford that the first regularly organized automobile meet in this country was held. This was five years ago. Although successful from a sporting viewpoint, the attendance was very slim, and the races have never been repeated.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—At Low Prices: Standard 4 Cycle Motors; Single Cylinder, 3½ H. P.; Double Cylinder 8 and 12 H. P. for Automobiles. Same with bases for launches. N. B. HARRINGTON & CO., 106 Broadway, Buffalo, N. Y.

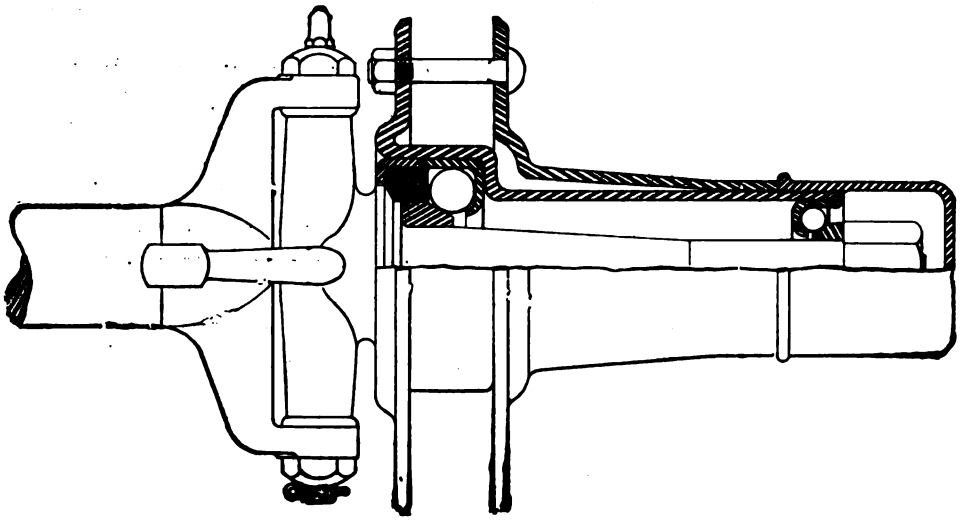
Made Drunk Pay for Ride.

An Illinois judge has decided that it is legal to charge a drunken man $7.50 for driving him around in an automobile until he was partly sobered up.

It appears that while Frank Whiting and Morris Smith were riding in a rented automobile one evening in Peoria, Ill., they found William Laughlin lying helplessly intoxicated on the sidewalk. In response to his request for them to take him to the Hotel Lud, they placed him in the automobile, and he, being then and there much befuddled, told them that he would give them $5 for the service. After he got in the seat he further promised to raise the bill to $7.50 if they would ride him around for an hour until the evening air cooled his fevered brow. They not only did so, but doctored him with bromo seltzer, and by the time they delivered him at the Hotel Lud he was in pretty fair shape.

After he got sober he repudiated the bill and then they sued him. The case came up in the court of Justice Schofield, and it was decided against the defendant, a judgment being rendered in favor of the automobilists.



Another Club for Vermont.

With twenty-five members, an automobile club has been formed by motorists of Burlington, Vt. These officers were elected: President, Dr. D. C. Hawley; vice-president, O. S. Presbrey; secretary, E. A. Brodie; treasurer, G. A. Churchill.

'Frisco Supervisors Fix Prices.

After deliberating for several months and taking a great deal of testimony, the License and Orders Committee of the San Francisco Board of Supervisors has made a report on the rates to be charged on hiring automobiles. It recommends that $3 be the maximum charge for the first hour and $1 for each succeeding half-hour. An effort was made to place the first hour figure at $2.50, thus cutting down the present figure by half, but a protest from the automobile dealers prevented this.

The proposed ordinance is to apply to machines carrying four persons or less. There is to be no reduction for fractions of hours or half-hours.

THESE HUBS are drawn from Sheet Steel.

Extremely light and strong Hubs with a smooth surface for finish are obtained.

Center line of Spokes is close to Steering Head. Smooth and Easy Steering is obtained.

Races are GROUND IN POSITION.

Cones and Cone Seats on Spindles are GROUND TO GAUGE.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

The Week's Patents.

771,272. Resilient tire. Sam T. Richardson and Richard Price, Birmingham, England. Filed October 30, 1903. Serial No. 179,215. (No model.)

Claim.—1. A pneumatic tire or other resilient tire, made with depression such as b2 on its inner periphery at regular intervals apart and adapted to engage with corresponding studs or projections at the bottom of the trough section wheel rim so as to prevent the tire from creeping, said depressions forming dome-shaped projections in the interior of the tire, substantially as set forth.

771,320. Internal combustion engine. Oscar P. Ostergren, New York, N. Y., assignor to Fuel Oil Power Company, New York, N. Y., a corporation of the District of Columbia. Filed October 2, 1903. Serial No. 175,462. (No model.)

Claim.—1. In an internal combustion engine the combination with a cylinder and a piston therein, of a fuel admission valve communicating with the interior of the cylinder, and a compressor comprising a cylinder and a piston, for operating said valve, the piston of said compressor equalized as to fluid pressure within the said engine cylinder by admission above and below same of fluid from the working end of said cylinder.

771,332. Induction coil. John Splitdorf, New York, N. Y. Filed February 23, 1904. Serial No. 194,794. (No model.)

Claim.—1. An anxiliary condenser for spark coils, the opposite terminals of said condenser being, respectively, connected in the primary circuit at opposite sides of the engine make-and-break device.

771,456. Suspension device for differential gearing. Auguste E. Brillie, Paris, France. Filed December 29, 1903. Serial No. 186,974. (No model.)

Claim.—1. The combination, with a driving axle, a differential shaft, and a bearing therefor, of a suspension device secured intermediate its length to the bearing, a collar carried by one end of the device for engagement with the driving axle, and a connection between the other end of the device and a fixed support.

771,492. Carburetter for explosive engines. Charles F. Parmenter, Portlandville, N. Y. Filed March 12, 1904. Serial No. 197,791. (No model.)

Claim.—1. In a carburetter, a capillary disk or partition, in combination with a pair of connected tubes for conducting liquid hydrocarbon of different qualities, a discharge nozzle supplied by said tubes and valves in close proximity to said nozzle for controlling said tubes individually and changing the fuel instantly at any moment substantially as set forth.

771,511. Speed regulator for explosion engines. William C. Tompsett, Warren, Pa. Filed October 6, 1903. Serial No. 175,925. (No model.)

Claim.—1. In an explosive engine, a hollow shaft having a flattened peripheral portion, a valve operating cam mounted upon such flattened portion and supported thereby, a rod arranged parallel with the shaft and connected to the cam, and a governor connected to said rod.

771,538. Wheel rim for hollow tires. Elmer M. Downs, Chicago, Ill. Filed January 11, 1904. Serial No. 177,627. (No model.)

Claim.—1. The combination with a wheel rim having marginal flanges, and a hollow or pneumatic tire casing divided longitudinally to provide opposite base portions adapted to engage the rim flanges, or a centrally arranged independent binder adapted to engage the two base portions of the casing, said binder being transversely divided and arranged to be drawn and wedged against the base portions of the casing and in alternation therewith to be lifted up within the chamber of the casing; a rotary and longitudinally adjustable key adapted to detachably interlock with the binder and supported for adjustment radially as to the wheel rim to draw the binder against the base portions of the casing and in alternation therewith to raise the binder within the chamber of the casing according to the direction in which the key is longitudinally adjusted; and means for adjusting the key in a direction radially toward the centre of the rim.

771,565. Automobile. Henry Nyberg, Chicago, Ill. Filed September 13, 1902. Serial No. 123,255. (No model.)

Claim.—1. In an automobile, the combination of a supporting frame mounted on a pair of axles; an engine frame rigidly secured to said supporting frame; a driving shaft journalled in said engine frame; said engine frame being separable on a plane extending through the axis of said driving shaft in a suitable manner to permit the removal of said driving shaft without disturbing the connection between said engine frame and supporting bar; a flywheel rigidly secured to one end of said driving shaft; a driven shaft mounted in alinement with said driving shaft, and having its end which is opposite said driving shaft journalled on said frame; a ball and socket joint connecting the adjacent ends of said shafts; suitable yielding connections between said driven shaft and said flywheel; and suitable mechanism connecting said driven shaft with one of said axles, substantially as described.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

Auto-talks No. 1

In this, our first "Auto-talk" to the readers of Motor World, we do not intend to discuss speed, control or any of the technicalities of automobiling.

What we do want to talk about this time is *value*.

A sensible man doesn't want to pay any more for a thing than it is worth—he wants a thing to be worth all he pays for it.

He doesn't want to pay a big price just because the maker thinks he can get that price, and he doesn't want to be told that a machine is a *good machine*, when it is really only good for the money.

Naturally he asks "Why cannot the automobile business be put upon a solid footing of *cost* and *worth*?"

It was to answer this question that we started a great automobile plant eight years ago.

And to-day we offer to the public the **Autocar**—*an automobile that is built and sold on a commercial basis*—and the only one.

The Autocar is beyond the experimental, feeling-the-way stage.

It costs what it is worth—it's worth what it costs.

Every part from motor to minutest detail of mechanism is built upon lines that have been demonstrated by test and practice to be correct.

The Autocar has all the features of comfort, convenience and safety found in the highest priced car. Every part is instantly accessible. It is built throughout in the best manner of the best materials and finished in the finest possible style.

The Autocar has a speed of from 3 to 35 miles an hour. Extreme ease of control is attained through an unusually simple arrangement of levers.

The price of the Autocar touring car shown above is $1700—the Autocar runabout $900.

In our next month's talk we will give you more details of the Autocar's construction and performance. In the mean time we ask you to send for our booklet, in which are found addresses of our dealers throughout the country. There is one near you.

One thing is certain, you cannot afford to buy an automobile without investigating the Autocar.

AIR COOLED. DIRECT RADIATION.

The following letter speaks for itself.

Chicago, Sept. 12, 1904.

PREMIER MOTOR MFG. COMPANY,
Indianapolis, Ind.

Gentlemen—I wish to take this opportunity to tell you that I am more than satisfied with my machine. It has averaged seventy-five to a hundred miles daily since I purchased it. On the hottest day of this season—July 15th—Mr. George Elmslie and myself left Chicago, making a run of one hundred and thirty-eight miles without a stop save for luncheon.

I have made two trips to Oconomowoc without stop and return, and have stopped but twice or three times for insignificant repairs since using it.

I have had a great deal of experience in the last five years, and have decided that this is the best machine for my daily work and pleasure. All I need now is a coupe top for Winter work.

Cordially yours,
F. H. BLACKMARR, M. D.,

MORE ABOUT

WINTON

POLICY FOR 1905.

Automobile manufacturing success depends upon three principal considerations:

1.–Studying the desires of the buying public, to know ***what is wanted.***

2.–Designing and building to ***gratify that want.***

3.–Having complete manufacturing facilities, making it possible to ***deliver the goods*** when they are wanted and at a ***reasonable*** and ***attractive price.***

With our elaborate manufacturing facilities (our plant is the largest and best equipped in the world), we are most thoroughly able to produce and ***deliver the goods*** at a price which will certainly be ***reasonable*** and ***attractive.***

We have, during the past year, studied most carefully the desires of the buying public. We are very certain that the models decided upon will win increased fame and popularity for the house of WINTON.

The automobile purchaser to-day ***knows what he wants.*** And he also knows somewhat of values.

The new WINTON models, which we will very soon announce and be ready to market, have been designed and developed after very carefully considering, down to the minutest details, the wants of the buying public.

In fact we are going to provide some radical improvements in the direction of ***simplicity*** and vastly increased ***motor efficiency,*** of which Sales Agents and users have no thought at the present time. And these improved features will be ours exclusively. We own the patents and propose giving WINTON purchasers the full benefit.

To the hundreds of inquirers who ask whether Mr. Winton has designed a four-cylinder vertical motor incorporating all the advantages of our horizontal construction, and at the same time eliminating all the annoying disadvantages of the present day vertical motor as designed by other manufacturers, we are obliged to report our decision to hold off a week or two more before announcing our complete manufacturing policy for the ensuing year.

Sales Agents not now in touch with our Sales Department are respectfully asked to communicate.

To all responsible Sales Agents this word of advice: Don't "load up" with a line of uncertainties. Wait. We will soon announce a most complete line of cars. The different models will please you because they will please your customers. We will do business with you and you can do business with a large percentage of prospective purchasers if you control WINTON products in your territory during 1905.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, October 20, 1904. No. 4

TO SUPPLY GAS IN TANKS

Company Formed to Extend Avery System—One Maker Adopts it for His 1905 Cars.

In Indianapolis last week there was completed the organization of the Concentrated Acetylene Co., which had been forming for some little time. Carl Fisher is president and sales manager, and J. A. Allison, secretary and treasurer. P. C. Avery is general manager. Its capital is $10,000.

Headlights and other lamps will be included in the new company's productions, but its more immediate and chief purpose is the exploitation and extension of the Avery system of acetylene lighting. In a small way, Mr. Avery himself has introduced the system during the past year, but if the plans of the Concentrated Acetylene Co. attain fulfillment, there will result at least a partial revolution in the manner of illuminating automobiles. Briefly, they purpose supplying steel tanks charged with gas which, when the supply is exhausted, will be exchanged for full ones. The tank is of seamless tube, and is 20 inches long, 6 inches in diameter and weighs 24 pounds; it is fitted with a ground joint union and valve at the upper end and a pressure gauge at the lower one. This gauge is so made that it will hold gas up to 550 pounds; that pressure will open the valve and permit escape, thus absolutely eliminating danger of explosion. The tanks are charged with gas compressed to 250 pounds, and contain 50 feet at this pressure, which is sufficient for two lights for 100 hours, or, with average use, for about three weeks; the charge for recharging is $1.50.

It is the intention of the company to establish agencies throughout the country, at which empty tanks may be recharged or exchanged for full ones. At least, one concern, the Apperson Bros. Co., of Kokomo, Ind., will make these tanks a part of the regular equipment of their 1905 cars.

The Concentrated Acetylene Co. has a new factory under roof and almost ready for occupancy. It will have a capacity of 25 tanks per day.

Diamond Men in New Settings.

A shift in the selling forces of the Diamond Rubber Company, which has been under consideration for some time, was effected this week, during the visit of Secretary W. B. Miller to New York.

Due to it, O. J. Woodard, manager of the New York branch, becomes general representative, and, while his headquarters will continue to be in New York, he will act as the company's general selling representative among the large trade. S. F. Randolph, manager of the Philadelphia branch, succeeds Mr. Woodard as New York manager, but will also retain control of the Philadelphia branch. G. L. Bradley, who has been Mr. Woodard's right hand man, goes to Cleveland to become manager of the Cleveland branch.

Long Pending Patent Finally Issued.

There was issued on Tuesday of this week patent No. 772,571, which, it is intimated, may have a considerable bearing on the electric vehicle trade. The patent, which has been pending since September, 1897, covers the general arrangement of control and reversing lever, and applies also to battery construction, connection and control. The inventions covered are those of H. P. Maxim, Harry N. Pope and Herbert W. Alden, all of which were assigned to the Electric Vehicle Co.

Atkins Resigns; Gould Moves Up.

Owing to continued ill health Arthur L. Atkins, long identified with the Pope interests and latterly manager of the Pope Mfg. Co.'s Chicago factories, has resigned that office. His successor is D. W. Gould, formerly assistant manager. Atkins has been ill for a year or more, and several times was so badly off that he was obliged to refrain from work and seek other climates. It was during these absences that Gould proved his possession of the ability that led to his promotion.

Banker Confesses Judgment.

Upon a confession signed by Albert C. Banker, president of the Albert C. Banker Automobile Co., Chicago, Judge Holdom last week issued a judgment of $353 against Banker. The action was instituted by the Winton Motor Carriage Co. for October rent of premises occupied by the Banker company at Michigan avenue and Thirteenth street.

PROTESTING THE AWARDS

Findings of Exposition Juries do not Pass Unchallenged—How the Decisions Were Reached.

Although the St. Louis Exposition awards, as exclusively announced in last week's Motor World, had received the approval of the Superior Jury, it is understood that several strenuous protests have been filed. Whether they will affect the findings cannot be foretold, of course, but that the bestowal of at least one of the grand prizes fairly staggered the industry is not to be gainsaid.

The methods employed by the juries of award in reaching their decisions are not generally understood. The average person labors under the impression that the awards are based wholly on mechanical excellence, but this proves not to be the case. This is made clear by Henry Souther, the well known expert, who served as a member of the automobile jury, who, in response to the Motor World's inquiry, explains the system that prevails in this wise:

"In the first place, there are five grades of awards, given in order of merit—the grand prize, gold medal, silver medal, bronze medal and honorable mention.

"There is no limit to the number of each grade that may be given. If all the exhibits were of equal rank, and of the highest possible quality, all would get a grand prize. If, on the other hand, all the exhibits were of inferior quality, all would receive a lower mark.

"As a matter of fact, it is not very difficult to classify all the exhibits under some one of the above five classes, and award in accordance with the relative standing. It must be understood at the outset that an exhibitor may receive only one medal, no matter how many different kinds of automobiles he may manufacture. A medal is not awarded for any one particular vehicle, as distinguished from the remainder of the product.

Many points are considered, such as the age and standing of the company in the financial world, its size and integrity; then

Digitized by Google

the character of the exhibit, as presented at the Exposition—whether representing the entire product, or some one portion of it only. Then comes a detailed examination of the machines actually on exhibition, the machinery and its finish making one detail—a certain percentage of the whole; the body and its finish making a second, and the general considerations above mentioned influencing the whole.

"Another thing is the importance of the product in the commercial world; whether or not it plays any considerable part in the market for automobiles, or whether it is a highly specialized thing, having a very limited sale.

"After making all these notes, and completing the round of the entire exhibit, the juryman has pretty well fixed in his mind the general comparative standing of each exhibitor, as compared with all others.

"With all these facts and impressions in mind, the jury gathers about a table, consulting notes and data, and makes the award, consideration being continued until the vote is unanimous.

"It is not always an easy task at the best. There are some exhibits that are exceedingly hard to classify, but, as a rule, there is enough difference, all things considered, between the best and the worst to make a reasonable set of awards."

Suits Against the Sandusky.

A number of suits have been brought against the embarrassed Sandusky Automobile Co., of Sandusky, Ohio. The first of these is an action brought by the Mahin Advertising Co. to recover $1,000, with interest at 6 per cent, on a note given the Mahin Advertising Co. by the Sandusky Automobile Co. and J. J. Hinde and J. S. Bennett. When the note had matured there was no money to pay it. A second cause of action is for another note of $1,000 with interest, which has not been paid. Plaintiff prays judgment for $2,000, with interest at 6 per cent per annum from June 29, 1902.

Next, the Savings Building and Loan Co. of Sandusky filed foreclosure proceedings in five cases against the Sandusky Automobile Co. One case is against the Sandusky Automobile Co. and John Keimer for a loan of $900, alleged to have been made July 7, 1904, and one is against the Sandusky Automobile Co. and Charles Knupke for $900 for a loan alleged to have been made July 7, 1904.

The other three cases are against the Automobile Co. for the following alleged amounts: $800 on July 6, 1903; $950 on May 14, 1904, and $1,100 on May 14, 1904, all due the Savings Co.

Parker Becomes Advertising Manager.

After serving a term in the sales department, Burton Parker has been appointed advertising manager of the Olds Motor Works, Detroit. He is no stranger to either the duties or the trade, his long connection with the Hartford Rubber Works Co. having made him well and widely known.

SCHOOL FOR CHAUFFEURS

Locomobile's Experiment Panning Out Well—How the Pupils are Instructed.

While comparatively little has been said of it, the school for chauffeurs which has been maintained during the year by the Locomobile Co. at its Bridgeport factory, has achieved some happy results. The practical experience and knowledge of details that is gained by such a course of instruction is invaluable, and has boosted many young men into berths and wages that previously they hardly dared dream of. The school has really not received the attention it merits; indeed, the exact course which the pupils must follow was not known until last week, when John A. Kingman, advertising manager of the Locomobile Co., outlined the details. He said:

"We usually start a man assembling finished cars, and keep him there about a month. This gives him a good idea of the location of all the parts and how they are fastened together, and which means that he will know how to get them apart. This latter is very important knowledge.

"We then put him assembling the engine proper, which gives him the same knowledge in detail of the engine that he gains of the whole car in his first month's experience. We usually keep him on the engine job a month, completing his instruction, thereby instructing him in the testing of an engine for horsepower developed.

"The man is then transferred to the electrical department for about a week, where he has a chance to observe and work on the various electrical devices, which thoroughly instructs him in their maintenance and enables him to overcome difficulties he may meet with—the wiring system, dynamo, batteries, switches, etc.

"The man is then ready for the road, where he is given an hour or two of instruction each day for a couple of weeks, in the meantime working in the repair department, where his finished and perhaps best knowledge of the difficulties he may have to contend with are brought to him.

"For such instruction he is expected to willingly give his time without pay. Even in such cases we have found it unprofitable to continue instructing certain applicants. In most cases we discontinue on account of the applicant's total lack of necessary fundamental knowledge.

"The best men are recruited from the ranks of machinists, repair men, or assemblers, and especially those that have had practical shop experience in construction work, and more especially when such work has been in connection with gas engines, either for automobile or other uses to which the gas engine is put. Such men develop much faster than men who have had no shop training of one sort or another.

"Shop training of one sort or another is absolutely essential to the making of a first-class chauffeur. By this is meant one who can maintain as well as operate his car. It is, of course, possible to make a good chauffeur out of a man who has not had mechanical training, but it takes very much more time to do it."

New Chips off the Diamond.

Pursuing its policy of expansion, the Diamond Rubber Co. has opened new branches at Minneapolis and St. Louis. At the latter R. L. McCrea, who has long been identified with the Chicago office of the company, will be in charge at No. 3,966 Olive street, and at Minneapolis W. E. Roby, who has been looking after trade for the Diamond company in that section for some time, will take care of the business, the stores being located at No. 611 First avenue, South. Complete tire stocks will be carried at both new branches, which will begin business on or before November 1.

Motor With a Push Button.

The Detroit Auto Marine Co. has succeeded the Detroit Lackawanna Co., which latter was selling agent for the Lackawanna Motor Co. in Detroit and the West. They will market a new type of engine for automobiles and boats, and have their new models nearly ready for the market. It will be known as the "automarine" engine, and has been perfected so that it may be started with a push button. They are now fitting one of these in a car for exhibition purposes. The company will also market a new circulating pump, the Bradbery "Bi-Centro."

Wayne's Work Progressing Well.

The Wayne Wagon Works, the big implement and wagon concern at Richmond, Ind., which are likely to prove a factor in next year's trade, are progressing famously with the car on which they have been at work for some time. It is of the four cylinder, air cooled type, and the enormous facilities at the command of the company indicate that once under way there will be nothing lacking.

Waltham Adds Two New Cars.

For the 1905 season the Waltham Mfg. Co. will market, in addition to their buckboard, surrey, runabout and small tonneau, a four cylinder, side entrance car at about $2,000, and another car at about $1,500. These new cars are building under the eye of the Waltham company's new superintendent of construction, Leo Melanowski, formerly with the Winton Motor Carriage Co. and previously with Clement & Co., of Paris.

Where Wheels are Whirling.

The extensive plant of the National Wheel Co., Jackson, Mich., which had been shut down for thirty days for needed repairs and alterations, is now running again full time and full force. Manager Mercer states that they were never before so greatly rushed, the demand for their wheels forcing them to begin operations before the alterations had been entirely completed.

Digitized by Google

LOGAN BEGINS TO LOOM LARGE

Western Concern That has Made Good Progress —Builds New Plant and has New Car.

Although it was accomplished without fuss or fireworks, the Logan Automobile Co., Chillicothe, Ohio, is one of the comparatively little known concerns that scored a very emphatic success this season. A 33 1-3 per cent dividend and a new factory are the substantial evidences of it. They have just taken possession of the new plant, which is shown by the accompanying illustration, and which

is admirably equipped for its purposes; in it the work on the Logan cars for 1905 is well advanced. There will be two of them—the touring car, which will be of 20 instead of 15 horsepower, as before, although the price will remain $1,500, and the "Logan Junior," a small two passenger car, of 8 horsepower, at $600.

The touring car will employ a two cylinder double opposed motor, 5x6 inches, with mechanical valves, and will have a side entrance tonneau, of course. The frame will be of angle iron, trussed, and be made in the Logan factory; the wheel base will be 94 inches. The Schebler carburetter, chain drive, sliding gear transmission and a clutch ingeniously operated by a flange on the flywheel, and which is claimed to entirely eliminate jerking and jumping, will be used.

Not the least feature of the Logan will be an adjustable steering post—one that may be shortened or lengthened, according to the height of the driver.

The "Logan Junior" will have an 8 horsepower air cooled engine under the hood, a wheel base of 90 inches, 32-inch light artillery wheels and solid tires.

Winding Up the American.

The affairs of the American Motor Carriage Co., of Cleveland, Ohio, which have been in the hands of the Prudential Trust Co. as receiver for many months, are about ready to be closed up, and the attorneys of the trust company will shortly file the formal report of the situation.

The property has been sold, and the entire assets are now in cash in the hands of the receiver. There will be a very severe loss to the creditors, as the situation now indicates that the creditors will receive but about 30 per cent of the amount of their claims. The company owed about $55,000 when it failed.

The Week's Incorporations.

Topeka, Kan.—The Smith Automobile Co., under Kansas laws, with $100,000 capital.

Chicago, Ill.—Garfield Automobile Co., under Illinois laws, with $15,000 capital. Incorporators: N. E. McDaniel, George Schien and Justus Chancellor.

St. Louis, Mo.—Original Automobile Supply Co., under Missouri laws, with $10,000 capital, half paid. Stockholders: A. L. Dyke, Carrie Dyke and Charles Peters.

Brooklyn, N. Y.—Brighton Beach Automobile Club, under New York laws, with $2,000 capital. Directors: W. A. Engeman, A. H. Battersby and C. H. Hyde, Brooklyn.

Memphis, Tenn.—The Memphis Motor Carriage Co., under Tennessee laws, with $100,000 capital; to manufacture steam automobiles. Officers—W. T. Watson, president, and Herbert H. Pilcher, general manager.

Detroit, Mich.—Schwarz Motor and Fire Truck Co., under Michigan laws, with $25,000 capital. Incorporators: Carl Schwarz, William H. Drittler and William J. G. Mourer, of Hancock; Byron J. Hart and Fred P. Obenauer, of Detroit, and William C. Bryant, of Brooklyn.

HOW THE DIAMOND DIFFERS

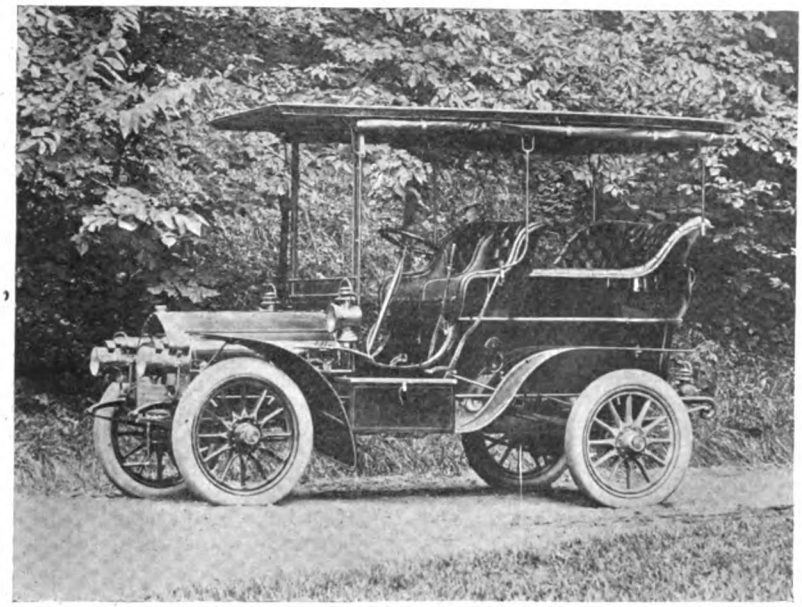
1905 Pattern of Famous Tire Embodies Many Substantial Alterations—What They Are.

Just what was meant by the announcement that the 1905 Diamond tire would be "still better and a full year in advance" was disclosed this week, when the new model was placed on view at the New York store of the Diamond Rubber Co. That the change is one of appearance as well as in construction is apparent at the first glance. Instead of being oblong in shape, as formerly, the tire is now nearly circular, thus being fashioned, as Manager O. J. Woodard put it, "in its natural shape."

It is in its construction, however, that the chief changes have been made. Instead of, as formerly, being cured in one piece, the main portion of the outer cover and the tread are now made separately, thus rendering possible the employment of two entirely different methods of curing. That of the cover proper is of a nature to insure the highest possible amount of durability and tenacity, to enable it to successfully withstand the various stresses and strains that are imposed on it in its capacity of a fastening. The tread, on the other hand, being merely a shoe, does not have to take any strain, and an entirely different method is adopted in curing. Thus each part is peculiarly adapted and constructed for the part it has to play when the complete tire is assembled.

In place of the smooth rubber tread hitherto used on Diamond tires, the 1905 pattern will be moulded with a cloth finish, such as marks a well known foreign make of tire. Experiments have demonstrated that this roughened tread acts as a partial preventive of side slip. With it the tendency to slip on greasy asphalt or macadam is considerably lessened, thus rendering it easier to control a car.

The method of attachment is, of course, retained unchanged, as is the well known Diamond lug, inner tube, etc.



Pope to Exhibit in Paris.

The Pope Motor Car Company has engaged space at the Paris show, which opens in the French capital in December. They will exhibit some new models that have never been seen before in public. Herbert H. Lyttle, whose clocklike work with a stripped 24 horsepower Pope-Toledo car attracted so much favorable comment in the Vanderbilt Cup race, will be sent over to act as demonstrator of the company's product.

Zent Will Make Air Cooled Cars.

The newly formed Zent Automobile Co., Bellefontaine, Ohio, will manufacture an air cooled car invented by S. W. Zent, after whom the company is named. The fact that a real automobile factory is to be located "in its midst" has aroused the town to a considerable pitch.

The Chauffeurs' Stipend.

As many employers have learned to their sorrow, it is a foolish policy to save a few dollars in the chauffeur's monthly stipend. A competent driver is worthy of a fair wage, and if he does not get it he is pretty sure to make up for it in other ways. Likewise, an incompetent driver will cost his employer dollars where the latter saves dimes in wages. Inefficient running of the car and excessive repair charges are the unerring signs of one and sometimes of both these employes, and the owner of the car should be sufficiently on the alert to detect the trouble and put an end to it.

Frequently, however, the difficulty is to satisfy one's self of the competency of the chauffeur. Unless the owner is a practical man and thoroughly familiar with the management of a car, he cannot be sure, however much he may suspect, that his driver does not know his business. And if he feels that he is not qualified to pass on the point, and looks around for expert and at the same time disinterested opinion, he is at a loss to find it. His tradesman will do what he can to help him out of his difficulty; but often it is very little that he can do. His hands are, in a measure, bound, owing to the fact that the supply of capable chauffeurs is not equal to the demand, and that he must, therefore, avail himself of the services of those in the market, as well as recommend them to his customers. It will not do to be perfectly honest and say, in effect, that So-and-So is a mighty poor chauffeur, but he is the best you can get and you might as well take him. That would repel the customer at once and make him forever dissatisfied.

It is scarcely an exaggeration to say that this scarcity of good chauffeurs is one of the most unsatisfactory things about the automobile industry to-day. Tradesmen everywhere are confronted with it. "If you will get me a good chauffeur I will buy this car," is a not uncommon proposal, and what response the dealer makes is not difficult to guess. He does the best he can, and if that is a mighty poor best he cannot help it.

There is every reason to believe that the automobile schools and classes which are being arranged for in many cities all over the country will do considerable to relieve the present scarcity of chauffeurs. They make the opportunity which so many ambitious young men are looking for; and that many of they will grasp it is beyond reasonable doubt.

Intelligent Assembling.

A few days ago a machine came out of the manufacturer's shop and was turned over to a customer. It ran beautifully until one day it began to skip a little, and as he was a long way from home he thought he would take a look at his spark plugs.

He hunted up his big wrench, 8-inch or 10-inch; fitted it to the spark plug, pulled at it, hammered it with his fist; got another wrench, and hammered it with that; and the plug still stuck.

Then he went and got a piece of a fence rail that he could use as a club, and, after a while, he got one of his spark plugs out. This happened to be the one that was not giving any trouble.

Then he tackled the other; but the position was not quite as convenient, and, after fifteen minutes' fruitless effort, he gave it up for a bad job and went home on "one leg."

The concern was a fine one, the mechanics were fine; but think how they hurt the reputation of that particular machine by this kind of assembling. There is no reason why a spark plug should not be tightened with an 8-inch or 10-inch wrench only with a slight pressure. A well fitting spark plug will almost be tight from hand tightening. The least touch of a wrench is all that is necessary.

This seems like a small thing to read about it, but you may be sure the man with the wrench, the wooden club and the blackened finger nail did not think it small.

As a matter of fact, it was just as bad as though some more seemingly important part had gone wrong.

The skilled mechanic, with his specially fitted socket wrench and his conveniently long levers to pull on and his hammer to rap it with, is a nuisance. Less brute strength and more intelligence in the assembler would be a fine thing.

The fact that all trouble was cured at the works by removing the plug having a cracked porcelain, and substituting one of the owner's extra plugs, did not make him feel any better. A simple thing like a tight plug had spoiled a good ride.

Effects of Side Entrances.

It is believed that the forthcoming Paris Salon will reveal a marked advance in the matter of body construction, as instanced more particularly in the cars with side entrances, which promise to almost monopolize the exhibition. Paris coachmakers, who have for years designed and built the great majority of automobile bodies, are known to have been laboring earnestly to evolve the ideally practical body, and from the hints that have been given out from time to time there is every reason to believe that they have achieved coach work that satisfies them.

Of course, it is the side entrance that has caused attention to be centred on the body and led to the striving after the something in advance of past creations. For two or three years the side entrance has been a characteristic of French and German cars, with the result that the tonneau has fallen more and more into disrepute. But with the general adoption of the side entrance has come the necessity for a settlement of many problems which have long perplexed both coach and automobile builders. Foremost among these is whether a long or a short chassis shall be utilized; while the shape and

Digitized by Google

size of the body has come in for a great deal of discussion.

Taking the latter first, the most debated question is whether the Roi des Belges body, in its exaggerated and bulging form in such general use, shall continue to be put forth as in the past. This pattern of body, originally designed for the Belgian King by a famous French coach builder, was purposely made bulging and rotund, although only to an extent that was founded on experience, and it had never been proved to be dangerous in any sense of the word. As such a design could not be patented in France the body in question has been extensively copied or rather distorted. These imitations, with their sweeping curves and projecting flanks, might give a fraction more comfort to the traveller than the original, but that there was danger in them there was no room to doubt. Experience has shown that when an overhanging body was mounted on a narrow chassis there was considerable sway set up at high speeds, with a consequent loss of stability and strain on the tires. This finally reached a stage where it became absolutely necessary to call a halt. This has at last been generally recognized, and future practice is certain to favor smaller and less bulging bodies than those now in use.

But with the substitution of the side entrance for the rear one used with tonneaus came the temptation to lengthen the chassis. Room had to be found for the side door, and the simplest as well as the most obvious way to provide it was to make the chassis longer; and a large number of makers did this, thus preserving the existing shape of bodies. But as wheel bases, and with them, of course, chasses, were already abnormally long, the addition of even a few inches wrought much harm. In traffic and in turning at high speed such cars were at a disadvantage alongside the old types. The result has been that coach builders have attempted other devices for providing the indispensable side entrances on short chasses, and in some instances with conspicuous success. There is yet room for new ideas, and, as stated, many of these are expected to make their appearance at the Salon in December.

In this country we have only made a beginning with side entrance cars. There is, for that reason, plenty of opportunity to avoid the mistakes of the French builders, and, by taking advantage of their experience, start right by producing bodies that will be as easily handled as the present all pervading tonneau type.

The Influence of Whiskers.

It must have been interesting news to the many men in and out of the trade who interested themselves in and who witnessed the race for the Vanderbilt Cup to learn that they are nothing but a lot of common "gamblers and idlers" saturated with "morbid cravings for excitement."

They probably did not appreciate the fact, and did not realize that the race was a "barbarous exhibition" until they were so informed by the bewhiskered if Horseless Age last week.

These frothings of that sheet would be pitiable if they were not amusing. They suggest an overflow of bile arising from a disordered liver, or of the anguish that comes of untangling knots in frazzled whiskers.

The "idlers" and "gamblers" can afford to view charitably their critic, who apparently did not even attend the race, and who relied on the "yellows" for his information. If the "gamblers" have any liver pills or indigestion powders to spare, they should be gratefully received by the Horseless Age.

Gears and Brute Strength.

If it were made a point to impress upon each purchaser of a car with sliding gear transmission exactly what takes place when a change is made from one gear to another, a great deal of good would be accomplished. We believe that it would pay to rig up a working model so that customers could see the mechanism in actual operation, for then, and then only, could those inferested obtain a proper and adequate idea of the process and see what a strain is imposed on the comparatively frail and highly tempered disks of steel which, with their circumference fashioned into teeth and mounted on shafts, constitute the gears.

Four men out of five will, once the modus operandi of gear changing has been demonstrated to them, exclaim that the wonder is that more damage is not done with chipped and broken gears, bent and twisted shafts, etc. And they are right. It is a marvel. Only good and cunningly manipulated steel, with just the proper amount of temper, would stand the racket. One has only to remember that the gears on two rapidly revolving shafts are thrust in and out of engagement at frequent intervals, ofttimes the manipulation being done by an inexperienced driver, entirely ignorant of the working of the delicate mechanism intrusted to his care, to form a pretty good idea of what might happen. That accidents are rare is one of those things not easy to understand.

It is true that the driver who, with his engine running at full speed on, say, his second, suddenly throws in the lever on the fourth by brute strength, without making even a pretence of "feeling" for the next gear, frequently pays the penalty for his lack of consideration in the shape of damaged gears or shafts. But in such case he invariably blames it on the car or its maker; anything rather than on himself, where it properly belongs.

At the same time it should be remembered that drivers of this class almost invariably err through ignorance. If they could be induced to study the mechanism of the gears by such a method as that referred to, they would undoubtedly become vastly better drivers and their cars would be handled with an intelligence that would bear fruit in insuring increased satisfaction.

On the principle that it is better late than never, the Automobile Club's tardy suspension of Mr. Harkness is to be commended. The Motor World condemned that young man's mad and sensationally touted dash from Boston to New York at the time it occurred, and commended him to the attention of the club. The club's action naturally has caused something of a breeze, but there is a real breeze of longer standing in the organization whose equally mad and more frequent, if unheralded, dashes through Long Island are matters of common notoriety, and who should have some of the wind taken out of his pace if it is impossible to remove it from his name.

The bewhiskered Horseless Age, which did not attend the Vanderbilt Cup race, condemns it as "of no earthly use." In the same issue one of its contributors, who did see it, relates that "during and after the race" he "talked with five different men, all of whom declared their intention of purchasing automobiles," their decision being influenced by the race. It is not the first time that whiskers have become entangled in their wearer's eyes.

It seems about time to cease fooling the public with those photographs designed to show the terrific speed of particular automobiles, the speed being represented by a distorted forward inclination of the car. The distortion is not even a freak of the camera. It is due merely to a trick of the operator in moving the camera as the object moves.

HOW HIS PROFITS SHRINK

Unusual Expenditures Make Big Hole in Retailer's Commission—A 20 Per Cent. Business.

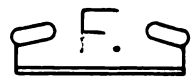
"Most people have an impression that the profits in the retail automobile business are enormous, and appear to think that we should be rolling in wealth. It would surprise some of them to know just how little there really is in it, when a balance comes to be struck," remarked a well known Metropolitan dealer last week.

"Such people merely view the commission received by dealers. They calculate that 20 per cent on a car listing at $1,000 is $200; while on one costing $4,000 it is $800. 'My! What a lot of money!' they will exclaim, never stopping to think that there are expenses of all kinds to be set against this lump sum—expenses entirely separate from the ordinary fixed charges, such as rent, wages, interest, etc., which any merchant has to calculate upon. The automobile business is a new one, and the automobile dealer has to put up with a lot of expense that will not be incurred a few years hence.

"A rough calculation will show that a charge of $200 will frequently be run up against a car by the time a sale is effected and delivery made. To begin with, there is the item of freight; on a big car, if the factory is in the West, that will easily run between $50 and $75. Then comes uncrating and setting up the car and testing it to see that everything is working properly. Next come the demonstrations. There's your supply bill, the time of your salesman or chauffeur—or both—and the thousand and one things that are likely to crop up and entail expense; and, as you are selling an article that runs into thousands of dollars, you naturally do things in a lordly way that recks little of expense.

"By the time it is all through, you are lucky if your outlay stops short of $200. Then there is your establishment to keep up. No one can have an idea of the enormous aggregate of expenses incurred unless one is actually in the business. You have got to do business on a big scale or you can't do it at all. It takes half a dozen men to sell a car, and you don't sell very many in a day. In fact, you don't sell many in a week, yet your expenses run on just the same.

"Any one who enters the retail automobile business thinking that it is a sort of El Dorado is booked for a sudden and sad disillusion. The proper way to look at it is this: It is only a 20 per cent business, as far as profits are concerned, whereas there are plenty of others paying all the way from 25 to 40 per cent; while the expense end of the business has the extraordinary expenditures attendant upon the sale of hazardous goods without the enormous percentage of profit that usually goes with such goods."



France's Enormous Export Increase.

France's imports of automobiles continue to increase enormously. During the first eight months of 1904 their value just fell short of $10,000,000, an increase of nearly 40 per cent over the figures for the same period of 1903.

Returns just published by the administration of the douanes show that there have been exported from January 1 to August 31, 1904, automobiles to the value of $9,895,000, while in the corresponding period of 1903 the figures were $7,295,000, and for 1902 only $3,978,200. For the same period the imports have been: 1904, $471,400; 1903, $133,200; 1902, $119,800.

Fisk Adopts a Rim Brand.

Henceforth the Fisk Rubber Co. mean that the reputation of their tire shall not be endangered by the use of indifferent rims.

To that end, and like other tire makers, they have adopted an inspection mark with which all rims approved as being fit for use will be branded. The mark is of the accompanying design. Only such tires as are used on rims so branded will be covered by the Fisk guarantee.

Three Cylinder Mercedes Coming.

It appears that the Daimler Motoren Gesellschaft (the German Daimler Co.) have been experimenting for nearly two years with a three cylinder motor of 8-14 horsepower, which has been designed to replace the 8-12 horsepower four cylinder Mercedes, model 1901. The rush of business has prevented them from giving so much time to the perfecting of the three cylinder motor as would otherwise have been the case, but it is to be hurried on very rapidly now, and it is probable that cars equipped with it will be on the market by next summer. The output of the great Cannstatt firm for next year is likely to total something like fifteen hundred cars.

Boston Firm in New Quarters.

Reed & Underhill, the energetic Boston representatives of the Knox car, have moved into their new quarters, 222 and 224 Columbus avenue. The building is located in the heart of the automobile district. It is a two story brick structure, and was practically built for the firm, which now occupies the greater portion of it.

The frontage is 45 feet and it has a depth of about 80 feet, being formed in a triangle.

Dayton Dealers Disagree.

Suit has been brought by W. Scott McDonald, of McDonald & Duvel, automobile dealers of Dayton, Ohio, to have the partnership dissolved. He says his partner and himself cannot agree as to the conduct of the business, which is being carried on at a loss.

SUPERVISORS RECONSIDER RATE

And 'Frisco Dealers Present Figures to Show That Rental Automobiles are Money Losers.

After seeming to have been definitely settled, the matter of fixing rates for hiring automobiles in San Francisco has been reopened, and the discussion over it rages more fiercely than ever.

It will be recalled that the matter came before the Board of Supervisors in the shape of an ordinance reducing the maximum charge for automobiles used for hiring purposes from $5 to $3 an hour. This was, after much debate and in spite of strong objections from San Francisco automobile dealers, passed. Last week, however, Supervisor Hocks moved to reconsider the vote by which the resolution had been passed, and this was agreed to in order to hear some further arguments against it.

Max Rosenfeld, of the Pioneer Automobile Co., said his concern had lost $30,000 in a year. The cost of running a machine, he said, was $3.76 an hour. The price fixed in the bill was $3 an hour and $1 for each subsequent half hour. He declared that at $3 every concern would go out of the renting car business. Personally, he would be glad to get cost for his stock in the company. Chauffeurs, said Rosenfeld, were paid $1.50 an hour when they worked. At that rate they earned about $100 a month. In Los Angeles chauffeurs received $40 to $60 a month. Rosenfeld said automobiles were luxuries, and that it made little difference to customers whether the rate was $3 or $5. The big cost of operating a rent wagon was said to be in repairs, due to the bad pavements.

H. L. Morrison, of the Central Automobile Co., made out a very bad case for the automobile livery business. Supervisor Rea remarked that the committee was able to find but one rental agency that was not losing money, but he said it was admitted that with a lower rate more machines would be used.

Supervisor Brandenstein felt that it would be well to go slow. He was not ready to vote. Notwithstanding the assurances of the committee that it was satisfied, he moved that the matter be referred back to the committee to find out the actual profits made from rentals. He said the finance committee would assist, if desired, and issue subpœnas.

The matter was taken up, said Braunhart, on the request of many patrons of automobile liveries, who believed that the rates were excessive. He explained that many agencies rented machines as an aid to advertising. Nothing had been brought forward to show that $5 an hour was not excessive. One firm ran ten machines 1,700 hours in one month. He wished, being author of the bill, that it be referred to the committees on finance, streets and licenses. On a general remonstrance being offered, he omitted the finance. This was agreed to. The clerk was instructed to get rates from other cities.

A Grand Prize

Has been awarded by the Juries of the
Louisiana Purchase Exposition Co. to

THE GEORGE N. PIERCE CO.

On its exhibit of

Pierce Automobiles

In recognition of superior quality in workmanship and materials, together with correct engineering and design.

The PIERCE Line for 1905 will include

PIERCE Stanhope, 8 H.P. - - $1200

Great Arrow, 24-28 H.P., Side Entrance, $3500

Great Arrow, 28-32 " " " $4000

Dealers can secure this splendid line now for all unoccupied territory and correspondence to this end is solicited.

WOOD ALCOHOL SOVLES IT

Expert Souther's Tests Seem to Settle Freezing Problem—How to Use the Alcohol.

During the last severe winter the writer made some practical experiments in the way of finding out what mixture could be used in the cooling system of an automobile that would prevent freezing and at the same time not be in any danger of injuring any part of the automobile.

Various salts, glycerine and wood alcohol were considered.

Wood alcohol was chosen for the first experiment because there was not the slightest chance of its injuring any machine. The success was such and the duration of the test was so long that nothing else was tried.

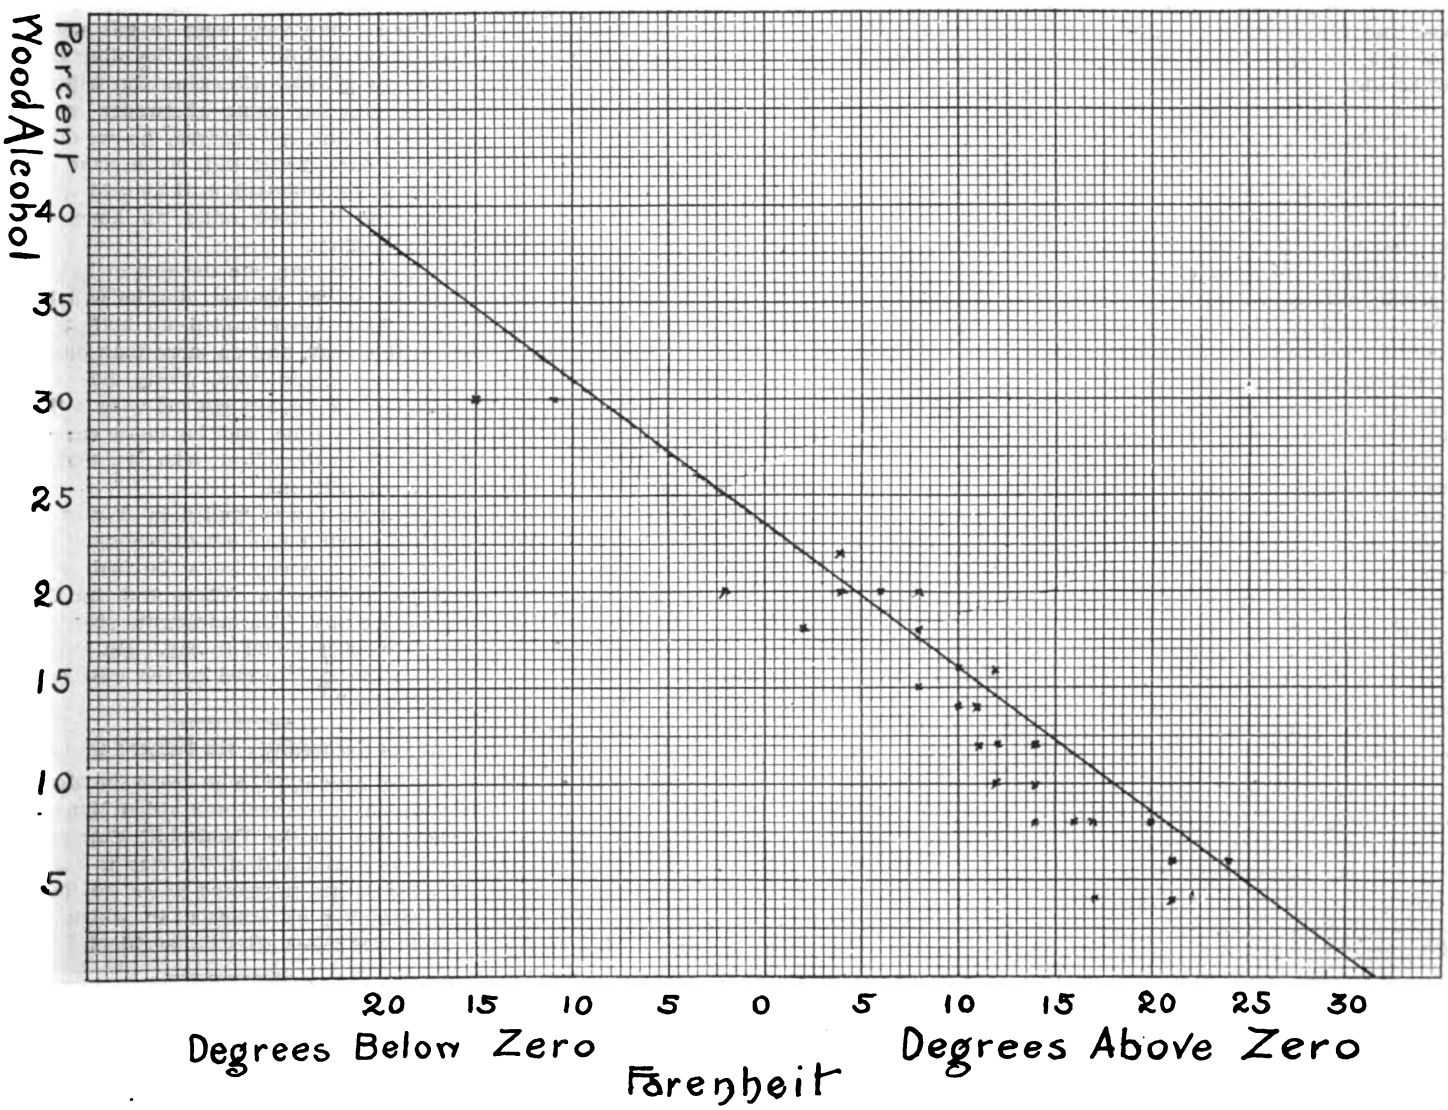
For the benefit of those, however, who care to run a machine during cold weather, the writer gladly gives the results of the experiments. Perhaps the most valuable use that can be made of these results is from now on, at a season of the year when riding is very acceptable during most of the day, but with light frosts at night and a sufficient degree of cold to ruin a cooling system if containing water only.

The character of the experiment conducted was this:

First—A set of laboratory freezing experiments to determine what percentages would freeze under artificial conditions. This showed at once that it was possible to use wood alcohol and water and resist almost any degree of cold.

Second—The next question to answer was whether or not the wood alcohol would separate from the water and waste away so fast that the scheme would be too expensive. Of course, this possibility amounted to but very little in extremely cold weather, but in mild days it was felt that considerable alcohol might be lost.

To demonstrate this point a water cooled machine was taken, and about 18 per cent of wood alcohol was added to the mixture. The whole system contained about seven gallons.



Various experiments were made by connecting a bottle with the top of the radiator into which a pipe led from above the water level, the idea being that any vapor formed would rise into the cold bottle and condense. It was found that, except under extreme conditions, no vapor at all arose. By extreme conditions, I mean any mild day, allowing the machine to run standing still, there being no fan for cooling.

This immediately led to the thought that it might be possible to entirely close the system in cold weather, thus obviating any chance of loss by boiling away. This was done and a pressure gauge put on and connected with the system. The highest pressure obtained at any time and under very severe conditions was six pounds.

This means that there are some machines that can be run with the use of alcohol without any loss whatever, there being a certain number of makes that run with a closed system.

It is also quite possible that many machines can be run with a closed system that now have relief tubes. The safest way to find this out in an inexpensive manner is to take a small bit of rubber tubing, fitting the end of the blow-off pipe, put a wooden plug in one end of it, and slip the other over the tube lightly. Any pressure that would injure the machine at all would blow this off and prevent injury.

Later in the season, when the temperature in this locality was as low as 15 degrees F. below zero, 33 per cent of alcohol resisted

Digitized by Google

freezing perfectly, even when the machine was left out of doors over night.

Within the last week or two the writer has been using 32 per cent of alcohol, with the temperature around 50 degrees F. and 60 degrees F., with a result that the mixture did boil slightly, but not enough to be dangerous.

This simply shows that at this season of the year it is not necessary, nor is it wise, to add much alcohol. It is not probable that the temperature, just now, or up to the 1st of December, will drop below 10 degrees F., in which case 15 per cent of alcohol is enough.

As the season progresses and December is reached and zero temperatures are possible at any time, nothing less than 25 per cent would be safe.

The question will be asked at once how to know whether or not the per cent of alcohol is diminishing in your water system. With nice laboratory instruments, it has been easy for the writer to study this matter, and easy to tell just how much loss there has been. For the ordinary operator, it is not easy, as the specific gravity varies very little from pure water, and it takes a finer instrument and better conditions than are likely to be found under ordinary circumstances. After all, the best and easiest way is by the odor. If the operator will mix up, say, a 20 per cent and a 10 per cent solution, put them in bottles and keep, he can have a standard of comparison that will really be quite accurate, with the assistance of his nose.

Even with the open system, the circulation and the cooler becoming quite hot in mild days, the loss of alcohol by boiling is extremely small. It is apparent that the alcohol does not go away by itself, but that the mixture of alcohol and water goes together, so that the percentage left remains practically the same.

Simultaneous with this practical using test another freezing experiment was carried out.

A number of test tubes were made up containing varying percentages of alcohol all the way from 4 per cent up to 30 per cent in steps of 2 per cent. These were placed in a basket outside of a window in a very cold place, and in the basket also a maximum and minimum thermometer. At 7 o'clock each morning the tubes were examined and the highest percentage of alcohol frozen noted. The results from slow and natural freezing like this, and duplicating the conditions of actual use, were a little different from the artificial laboratory freezing experiments.

The results obtained are shown on the accompanying curve. In drawing this curve the writer has been conservative, and the results possible are a little bit better than the table.

By consulting this the operator will be able to see at a glance about what alcohol is necessary to use, the only caution being not to add any more than is necessary.

The use of glycerine and alcohol seems likely to solve the question for both hot days and cold days; the boiling point of glycerine being considerably higher than that of water will average the low boiling point given by the alcohol, so that the mixture will be reasonably high.

The writer will make practical experiments along this line and give the results as early as possible.

The use of glycerine is a little more dangerous than the use of alcohol because of the possibility of its breaking down in contact with the hot cylinder wall, and partially closing or making a sort of insulation on the walls of the iron. Alcohol is not dangerous in any way. HENRY SOUTHER.

Long Distance Records Go at Cleveland.

The automobile records for fifty and twenty-five miles were broken on Wednesday at the Cleveland Driving Park during a matinee race under the auspices of the Cleveland Automobile Club and sanctioned by the American Automobile Association.

Charles Gorndt drove his Winton fifty miles in 55 minutes 42 seconds, against the former mark of 1 hour, 1 minute, 23 1-5 seconds; and Earl Kiser sent his Bullet twenty-five miles in 23 minutes 59 seconds, as against the previous record of 28 minutes, 40 2-5 seconds.

Were Insured Against Accidents.

According to the New York Journal of Commerce, the liability of the American Automobile Association as regards claims for damages in connection with the Vanderbilt Cup race, were covered by a policy written at Lloyds, London. The risk carried by Lloyds was understood only to apply in case of claims by spectators resulting from accidents and not to cover the participants in the race. Practically all the liability insurance companies doing business here were offered the line, but declined, and the deal was finally closed with the Lloyds by cable.

California Endurance Run Off Again.

After an infinity of talk and a number of postponements, the proposed endurance run from San Francisco to Los Angeles, under the auspices of the Automobile Club of California, has come to naught. The date for the contest was finally decided upon, after much parleying among those interested, for October 12.

Now it has been again postponed, this time to the spring of next year. The decision to postpone the event was reached last week by the executive committee of the club.

When the Police Hesitate.

Chauffeurs of experience soon get to know the processes of reasoning indulged in by their sworn enemies, the bicycle and mounted police, whose duty it is to see that the speed laws receive the fewest possible fractures. As a result, they can form a pretty good idea of the course the minions of the law will pursue in a stated case, and govern themselves accordingly.

"It is not often that I take any chances when I am alone, or with only one person with me in the car," one of the fraternity remarked to a Motor World man recently. "It would be a cinch that the cops would run me in in short order. But if I have two or three passengers I am not apt to be molested.

"You see, it is this way. Every time a cop 'pulls in' a man for speeding and gets a conviction it is credited to him. But if he can't prove his case to the satisfaction of the magistrate and the prisoner is discharged a black mark is put against him. Now, suppose he catches me alone and runs me in; it then becomes his word against mine, and it doesn't take very long to tell what the magistrate will do. If, on the other hand, I have two or three witnesses who will testify that I was not going at twenty or thirty miles an hour, as charged, he would have only his bare word; and, while some magistrates would believe him if he said we were going one hundred miles an hour, others would hesitate.

"So, rather than run the risk of having an acquittal scored against him, he will let me go. I have been hauled up half a dozen times this year, and on more than one occasion I was going—well, pretty close to the limit. But I always got off with a 'I'll let you go this time, but be more careful in future,' from the officer, who saw that I had witnesses with me.

"The time I was 'pulled in' I was alone, and I'll swear I was not exceeding the legal limit. But the cop knew he had a cinch, and he ran me in. There was no trouble convicting me. The magistrate scarcely listened to what I had to say. He slapped a fine on me and turned to the next case in short order."

Arents Recovering; His Father's Gratitude.

George Arents, jr., who drove the Mercedes car which overturned and killed Mensel, the mecanicien, in the Vanderbilt Cup race, is much improved and on the way to recovery. His father has presented $1,000 to the Nassau Hospital, at Mineola, to which young Arents was taken after the accident.

Will Stump State in Motor Car.

Automobiles are to play a prominent part in the campaign to be waged by W. L. Douglas, the millionaire shoemaker, who is the Democratic candidate for Governor of Massachusetts. He will make a tour of many of the towns and villages in a motor vehicle.

To Test Tires and Oils.

Suggestions are already being made in regard to the 1905 British trials. Among them are competitions designed to show the merits of different tires and of various lubricating oils.

C. C. Worthington, president of the Worthington Automobile Co., returned from Europe on Saturday last.

KISER NO LONGER KING

Is Decisively Beaten by Oldfield at Cleveland—New Figures Established for Standing Ten Miles

Looking not at all like a man who had announced his permanent "retirement" after the fatal accident which he was the cause of at St. Louis last August, Barney Oldfield made his appearance on his native heath on the Glenville track at Cleveland last Saturday, and was at least half the attraction of the meet. He set up new world's records for ten miles, from a standing start, and, incidently, smothered the aspirations of Earl Kiser, who for a short time had usurped the title of "King," which had been Oldfield's by popular acclaim.

Four thousand spectators turned out to witness the battle between Oldfield and Kiser, and they viewed with impatience the other contests which were run off between the two heats of the big match race. When the time arrived for the first heat of the match there was a lengthy discussion over the rules. It had been the general understanding that flying starts were to be used in all of the heats, but the racing committee had stipulated that one of the heats should be run from a standing start. It was decided to have the first heat, at ten miles, from a standing start, and the second, at five miles, with a flying start.

When the starting pistol was fired Oldfield's green machine jumped to the front and was at the quarter pole before Kiser could get the Bullet fairly under way. The track was fast, but rain had cut ridges in it in some places, and Oldfield's light car swerved on the turns, though the heavier Bullet was not troubled in that way. Kiser did not seem able to get the big Winton racer working properly, while Oldfield had no trouble with his new machine at all. Oldfield increased his lead with every mile, and won by almost seven-eighths of a mile.

The times for the ten miles was 9:17 1-5, which is 48 4-5 seconds faster than the former record, which was made by Charles Gorndt in the Winton Bullet No. 3 at the same track last August. The first mile was covered in 1:07 2-5, but the slowest mile after that was made in less than 56 seconds. The mile times were as follows: 1:07 2-5, 0:53 4-5, 0:53 3-5, 0:54 2-5, 0:55, 0:54 4-5, 0:54 1-5, 0:55 3-5, 0:53 3-5 and 0:54 4-5.

Oldfield's easy victory in the ten mile heat made him the favorite for the five-mile event, though both drivers were cheered heartily when they came out for the second heat. They rode slowly to the three-quarter pole, where they both put on speed and crossed the line well together. As they crossed the line and the starting pistol was fired, Oldfield again jumped into the lead, and at half a mile was more than thirty yards ahead. He kept on widening the gap between himself and Kiser, and at the end of five miles had a lead of a quarter of a mile.

Aside from the duel of the "Monarchs of Motoring," Webb Jay, and his White steamer furnished the most excitement of the day by emerging victorious in two races. Nor did Jay meet foemen in any way unworthy of his "steam," for in the first event he vanquished two cars of 24 horsepower and he took the handicap from five opponents.

The first event to be decided was a five-mile race for cars with not more than 24 horsepower, to be run with road equipment, though no passengers were carried. Webb Jay, in his White, was opposed by two 24 horsepower Peerless cars, driven by George E. Turner, of Pittsburg, and E. S. George, of Detroit. Turner took the lead at the start and kept it for the first two miles. When passing the grandstand, at the end of the third mile, Jay put on more power, and passed Turner, taking the pole at the quarter mark. Turner passed the White in the next mile and secured the pole again, but Jay took the lead on the backstretch of the last mile and won easily.

The five-mile handicap provided the most exciting competition of the day. In it were Charles Gorndt, with the Winton Baby Bullet at scratch; Carl Fisher, with the Premier Comet, who had received a handicap of 10 seconds but refused it and started from scratch with Gorndt; Joseph Tracy, with the Royal racer, 5 seconds; George E. Turner, Peerless, 20 seconds; Webb Jay, White steamer, 20 seconds, and E. S. George, Peerless, 35 seconds. After the first mile Jay was never in danger, though Turner gave him a good race. Fisher gave a fine exhibition with the Premier Comet, and, though he defeated Gorndt, the other scratch man, and George, the limit man, he finished fourth, Tracy and Turner defeating him, in addition to Jay. It was so late when the regular races were finished that the record trials were called off, though Carl Fisher drove one mile in the Comet in 1:01.

Summaries:

Five miles, 24 horsepower cars, road equipment without passengers—Won by Webb Jay (White); George E. Turner (Peerless), second; E. S. George (Peerless), third. Time, 6:36 1-5.

Ten-mile match between Barney Oldfield (Peerless Green Dragon) and Earl Kiser (Winton Bullet No. 2); standing start—Won by Oldfield. Time, 9:17 1-5. Time by miles, 1:07 2-5, 2:01 1-5, 2:54 4-5, 3:49 1-5, 4:44 1-5, 5:39, 6:33 1-5, 7:28 4-5, 8:22 2-5 and 9:17 1-5. Kiser's time, 10:12 2-5.

Five-mile open, stock cars stripped, 35 horsepower and under—Won by Burman (Peerless); Joseph Tracy (Royal), second; Webb Jay (White), third. Time, 5:37 3-5.

Five-mile handicap—Won by Webb Jay (White), 20 seconds; George E. Turner (Peerless), 20 seconds, second; Joseph Tracy (Royal), 5 seconds, third. Carl G. Fisher (Premier Comet), scratch, fourth; E. S. George (Peerless), 35 seconds, fifth; Charles Gorndt (Winton Bullet No. 3), scratch, sixth. Time, 5:40 2-5.

Five-mile match between Barney Oldfield (Peerless Green Draogn) and Earl Kiser (Winton Bullet No. 2); flying start—Won by Oldfield. Time, 4:43 3-5. Kiser's time, 4:59 2-5.

OLDFIELD RETAINS HIS SCALP

Reprimand will be Extreme Penalty Imposed for Duplicate Race Meet Entry.

Coming hot foot from Chicago last week, determined to rest only after the racing board of the A. A. A. had dealt out summary punishment to Barney Oldfield for his alleged breach of faith in not appearing at the Windy City meet on October 1, President John Farson of the Chicago Automobile Club departed last week in a chastened, even amiable, mood. He did not carry Oldfield's scalp back with him, and yet he was placated and almost ready to forgive the lapse of Oldfield so bitterly complained of only a short time before.

The change was brought about by interviews with Chairman A. R. Pardington and a calm and dispassionate examination of the evidence in the case. This showed that Oldfield was not to blame; or, if to blame at all, so little that his lapse was overshadowed by that of the racing board. The latter pleaded guilty to the charge of mixing dates and of having unwittingly granting conflicting sanctions to the Chicago and Pittsburg clubs. The mix-up occurred through the enormous pressure of work thrown on Chairman Pardington's office by the Vanderbilt Cup race. The mass of detail work entailed by that event was enormous, and during the trying time of dispatching it the sanction imbroglio occurred. By a curious coincidence a similar mix-up occurred between Oldfield and the Pittsburg promotors. A contract to appear at the Smoky City had been made in the summer, and while the dates were shifted around Oldfield's manager, not knowing that the same dates had been given to both cities, signed his principal to appear at Chicago. When it was seen that both meets would occur on the same day, and that only one of the two contracts could be lived up to, Oldfield decided to honor the older one by riding at Pittsburg.

To a Motor World man on Tuesday Chairman Pardington explained the situation.

"We got together last week, Presidents Temple of the Pittsburg club and Farson of the Chicago club, and myself, and thrashed the matter out thoroughly. Both gentlemen appreciated the strain and stress under which the racing board had been working, and evinced a disposition to make allowances and concessions. No official decision has yet been reached by the board, but there is every reason to believe that no drastic action will be taken. Oldfield and his manager appear to have acted without keeping in as close touch with each other as they should. That is really the extent of their transgression."

As a result of the canvass of the membership, there will be no fall tour of the Automobile Club of America; the opinions received made plain that there was no demand and little desire for anything of the sort.

CLEAN SWEEP AT CLEVELAND

G & J Thread Fabric Tire Wins Every Event

AT CLEVELAND (OHIO) MEET, OCT. 15.

Five miles for cars up to 24 H. P.—Won by 10 H. P. White steam car; time 6:36 1-5.

Ten miles match race—Won by Peerless Green Dragon; time 9:17 1-5—World's Record.

Five miles for cars up to 35 H. P.—Won by 24 H. P. Peerless; time 5:37 3-5.

Five miles handicap, open—Won by 10 H. P. White; time 5:40 2-5.

Five miles match race—Won by Peerless Green Dragon; time 4:43 3-5.

Why the New G & J Tire is Fast.

The fabric used in this tire is woven with very strong threads running in one direction, with very light, soft cross threads about an inch apart. In building the tire, the several layers of fabric are placed on the bias, with rubber between each and every layer. The cross threads are made as light and as soft as possible, as their whole purpose is to hold the fabric in proper position until the tire is built. These cross threads have no strength whatever. The rubber between each layer forms a cell about each of the strong threads in such a way that when the tire is completed there is not one thread touching, or in any way chafing against any other thread, and each and every thread bears its full amount of the inflation strain. Where what is termed "square woven fabric" is used, the threads in each direction being of equal strength, there must necessarily be considerable friction at each point where one thread crosses the other, and in fast driving this constant friction develops considerable heat. With our new construction, there is no heat whatever developed except what is generated from contact between the rubber surface of the tire and the road; there is no internal heat. The heating of tires has been the most serious problem in tire construction. It has been one point which tire makers have heretofore been unable to overcome. The heating of the tires causes the rubber to degenerate, and to eventually disintegrate.

Our new tire is far speedier than any tire ever before used, and the exhaustive tests which we have made have proven that the tires are more durable than any ever before used. We feel that this new construction means a long stride in the direction of reducing the trouble and expense of tire equipment to lowest possible point.

Trade Mark.

HUNTING BROUGHT UP TO DATE

Massachusetts Sportsmen Construct a Car in Which to Live While Seeking Game.

With a specially constructed body mounted on the chassis of a 16 horsepower automobile, Freeman N. Young, of Arlington, and Roy A. Faye and Dr. Albert H. Tuttle, of Cambridge, Mass., have begun a fifteen day hunting trip through New Hampshire and Maine. Upon the chassis Young and Faye have built a strong frame of wood, braced with steel rods, sixteen feet long, four feet ten inches wide and six feet high. For about four feet from the flooring the sides and part of the rear end are sheathed and painted terra cotta and then varnished. The roof is of waterproof carriage leather, and extends over the entire frame, the hood in front reaching a foot beyond the front wheels.

Hung from the frame, about three feet below the roof, is a 4x6 foot spring bed. The seat in front will accommodate three, and the bed may be reached from front or rear. Just in front of the steering gear is a curtain, which may be rolled down. A similar curtain at the rear converts the body of the vehicle into a cosy room, which is lighted by an incandescent elcetric light, the power being furnished by storage batteries.

Under the bed is a space three feet high, seven feet long and four feet ten inches wide, in which are stored an aluminum camp outfit, clothing, gasolene and provisions. There is also an electric heater, which may be used as a radiator to heat soldering irons or for cooking purposes in case of emergency.

It is the intention of the party to run night and day, one managing the machine while the other two sleep. As they travel they will select spots for camping when the roads are muddy. Meals will be obtained at farmhouses and hotels, or, when desired, can be prepared in the automobile. While the weight of the car is a little more than that of the regular body, no difficulty is expected in maintaining the speed of the car if the tires withstand the extra strain.

How to Detect Fake Platinum.

The principal metal used in the adulteration of platinum is silver, which does not alter its color, and even in the proportion of three parts of silver to one of platinum will stand the test of strong nitric acid if used cold. The only way of testing platinum is that which is used by refiners, i. e., boiling in strong nitric acid. Any one can do this by purchasing a small glass test tube. If the color of the acid is green after the boiling process it indicates copper as part of the alloy; the presence of silver is easily ascertained by putting common salt in the acid when cool. This throws down the silver in white flakes as chloride of silver.

Locomobile Used by the New York Fire Department.

Buying Cars for Japan's Army?

S. Ubikata, of Toronto, representing K. Ishikwa, of Yokohama, Japan, last week completed purchases which he has been making in this country for his principals. K. Ishikwa is an old established house, which for years was a large buyer of American bicycles, and of late it has turned its attention to automobiles. The latter are too expensive to be sold extensively in Japan, but a very fair trade in them is being built up.

That the war has not curtailed his purchases to any great extent was made plain by Ubikata's guarded remarks made upon leaving Toledo last week.

"Have I been buying motor vehicles for the Japanese government or for the use of the government in the present war?" he repeated. "Now, that is hardly a fair question to ask, and certainly I cannot answer it. The goods are bought here and sent to Ishikawa, at Yokohama, and there they are disposed of to those wishing to buy. I can say, though, that the war has not affected our business to any serious extent."

Motor Cars for Big Railroad.

The Union Pacific Railroad has been converted to the use of the gasolene motor, and, according to a dispatch from Omaha, orders have been placed for the construction of several cars for use on the local lines in Nebraska. The cars are to have a speed of sixty miles an hour, and will be large enough to carry thirty passengers.

During the period from August 11, 1903, until June 30 last, 852 persons in Washington, D. C., were granted permits to operate motor vehicles in the District.

FOR FRIGHTENED HORSES

Owners of Automobile Held Responsible but Appeal is Lodged and Fight is on.

A pretty thorough ventilation of the rights of self-propelled and horse-drawn vehicles, and the liability for damages incurred by one or the other, is likely to be the outcome of a suit now in litigation in the Hartford (Conn.) courts, which is to be carried up to the Supreme Court of that State.

It appears that on August 3, 1901, while an automobile belonging to the Hartford Electric Light Company was being driven through Trumbull street, a pair of horses belonging to the Trout Brook Ice and Feed Company was standing in the street. The horses took fright at the automobile. They ran away and were injured. The company sued the Electric Light Company for damages, and Judge Coats, in the Court of Common Pleas, awarded the plaintiff damages of $325. The Electric Light Company took an appeal to the Supreme Court, and the appeal was argued in the session of the court last week.

On the trial before Judge Coats, it appeared that the horses were left unhitched and unattended by the driver of the team and the lawyers for the Electric Light Company claimed that this act on the part of the driver constituted negligence directly contributory to the injury of the horses, but Judge Coats overruled the claim.

It further appeared on the trial before Judge Coats that at the time the horses took fright the automobile was being driven by Walter S. Swindell, an employe of the Hartford Electric Company, who at the time was going home to supper, and the Electric Light Company claimed he was not then in its employ in the relation of servant to master. It peared that it was the duty of Maurice Cavanaugh, another employe of the company, to take the automobile to the power station on Kinsley street to have it charged. Swindell lived near the power station, and Judge Coats found from the evidence that Swindell often, at the request of Cavanaugh, drove the automobile to the station, and that he was in the habit of doing so was known to the company. The Electric Light Company further claimed that at the time of the runaway Swindell had not been created the agent of the Electric Light Company to take the automobile to the station, and that instead of performing the duty of the master, he with two other employes of the company was taking a pleasure ride.

Judge Coats held that Swindell was acting in the service of the Electric Light Company at the time the horses took fright, and gave judgment for the ice company. The questions of law outlined and other questions formed the basis of the company's appeal.

The Allegheny County Light Co., Allegheny, Pa., has purchased a 10-horsepower White touring car, and will use it in travelling from one plant to another on inspection trips.

Paraded for the "Drummers."

An automobile parade was held in connection with the United States Commercial Travellers' Exposition at Boston last Saturday. Machines of all sorts took part, although the short notice on which the parade was organized was responsible for the small number of competitors. The parade was reviewed by Governor Bates and staff, and also by Mayor Collins.

The prizes were awarded as follows: Gold cup for largest number of entries by one manufacturer, White Sewing Machine Company; gold and silver cup for the best display by any one manufacturer, Pope Manufacturing Company; gold and silver cup for most original feature, a Winton car containing a yak and a leopard from the jungle at the exposition; silver cup for best decorated touring car, Park Square Automobile Station; silver cup for the best decorated runabout, Rambler.

Motorphobes Show Their Teeth

Not deterred apparently by the farcical nature of their attempt to block the Vanderbilt Cup race, the People's Protective Association, composed of residents of Nassau County, L. I., at a meeting held last week, decided to enter the political arena and thus wreak their spite on the officials who opposed them in that matter. They adopted the following resolution:

"Resolved, That the members of the People's Protective Association will do all in their power to defeat the election of the present District Attorney for county judge; and also the members of the Board of Supervisors, should the latter come forward for renomination."

The friends of the officials named assert that they will see that the efforts of the association come to naught.

Harkness is Finally Suspended.

Harry S. Harkness has been indefinitely suspended by the board of directors of the Automobile Club of America, the specific offense being his record breaking trip from Boston to New York on June 19 last. His run was made on a Sunday, and his time for the 245 miles was 6:55:00. One of the officers of the club said that the action had been taken by the directors in keeping faith with the legislators to whom the club had pledged itself to do its part to prevent the violation of speed laws.

Scarritt Declines Re-election.

Winthrop E. Scarritt, president of the Automobile Club of America, has announced that he cannot be a candidate for re-election owing to the demands upon his time of his private business. Though the present one is his first term as the head of the organization, many of the club members had hoped that he would allow himself to be nominated for another year. James B. Dill, the well known corporation attorney, has been mentioned as his successor.

ITS BACKBONE WEAKENS

Untrue to "I Will" Spirit Chicago Club Surrenders—Only Three Members Resolute.

It transpires that the action of the weak-kneed members of the Chicago Automobile Club—who appear to constitute a majority of that organization—in making their peace with the Windy City authorities was taken in the absence of President John Farson, who was in this city attending the Vanderbilt Cup race. Knowing well that Farson, the man with both backbone and brain, was unalterably and vehemently opposed to unconditional submission—or submission of any kind—they seized the moment when he was out of town to make terms with the enemy. In fact, the flabby ones literally tumbled over each other in their eagerness to sign a pledge in which they agreed to henceforth be good and wear the much contemned numbers. The pledge referred to was drawn in a hurry.

Secretary Sidney C. Gorham of the Chicago club is the man who led the revolt against Farson. He recommended compromise, stated that a majority of the club was back of him, and promised that the club would make formal submission.

So it proved. When the directors met Farson and F. X. Mudd were the only members who held out against surrender. Both men stood by their guns to the last. Farson recorded his vote against surrender and then departed for St. Louis before the club meeting was held. Mudd, however, was even gamer, for he appeared at the meeting and spoke vigorously against withdrawing from the contest; in this stand he had one lone supporter, viz., A. E. Tripp, who also went on record against surrender.

With these exceptions, the 150 members present voted solidly to kotow to the city officials. No official action was taken authorizing the withdrawal of the pending injunction suit, but the members who were made parties to the bill were given permission to obey the ordinance by affixing tags to their machines.

Resolutions were adopted, after a long preamble, asserting that the club finds that "adoption of numbers and compliance with the terms of the numbering ordinance is expedient and advisable for the purpose of suppressing reckless driving and an unreasonable use of the streets of Chicago by irresponsible and inconsiderate automobilists."

With the club virtually abandoning the suit by agreeing to use the numbers, City Electrician Ellicott now will devise some other means of stopping scorching than by arresting drivers of all untagged machines as they enter the parks. He has the use of fifty automobiles pledged by the club, and he expects to make a sudden sortie on reckless drivers with a squadron of specially picked policemen, equipped with stop watches.

The club ended its session by deciding on a campaign with a view to increasing the speed limit and defeating the licensing ordinance.

THERY ON ROAD RACING

Visiting French Crack Delivers Himself of Some Interesting Ideas and Opinions

Leon Thery, winner of the James Gordon Bennett Cup 1904 race in Germany, and George Callois, who was fifth in the French elimination trials for the James Gordon Bennett race this year and winner of the Gallion hill climb in 1902, were the guests of honor last Tuesday night at the Automobile Club of America, when the subject, "Automobile Racing in Europe," was discussed. Thery does not speak English, but his companion can express himself very well, and acted as interpreter for his more famous friend. The pair arrived in this country on La Lorraine last Friday, Thery coming here for the purpose of challenging the winner of the Vanderbilt race. Neither made a set speech, the information they gave being called out by questions from members of the club.

In contrasting the course over which the Vanderbilt race was run with the one over which Thery raced to victory in Germany this year, the Frenchmen declared that the American course is much easier than the one in Germany. The Long Island course is almost absolutely flat, while the one in Germany has three bad hills in each of the ninety-mile circuits. In another respect was the Long Island course easier than the German one, in that there are many straight stretches in the thirty-mile circuit, while straightaways were rare and of short length in this year's international cup race. They gave as their opinion that a careful manufacturer would construct entirely different cars for races over the two courses.

In the Vanderbilt Cup race the contestants had but three bad turns in each circuit, and they were all in the same general direction, while in the other big race turns of many different kinds and angles were constantly encountered. They said the difference could be best shown by saying that in the Vanderbilt race but two speeds need be used in gearing a car, while on the German course three or four speeds were absolutely necessary. The three worst hills in the German course were all encountered as controls were left, and it was necessary to set the brakes to avoid running backward while awaiting the timekeeper's word to start again. The three bad hills had grades of 15 per cent, and it was necessary to use the second speed in climbing to the tops of them. Even with the second speed the car would attain a rate of eighty kilometres an hour.

Thery said he would prefer to have long distance races run without controls. In answer to an inquiry if such contests would not be too hard on the drivers, he said that he thought such events were easier for the contestants than ones in which there were many controls.

When asked if he ever feared for his life, Thery smiled for the first time during the inquisition, shrugged his shoulders and said he never thought of it. To be a successful racing man, he said that one must drive as though he were the only man in the race. The others should never be thought of, as the more cool you were so much were your chances of winning multiplied. A racing man should give his entire thought to his car and only consider how he may obtain the most speed from it. If a driver fears he will be injured, he should never do any racing at all. As to danger from punctures or bursting tires, Thery did not seem to think much about it. The only chance for an injury, he declared, was if a tire were to explode when a car was rounding a turn at a high rate of speed. If such an accident were to happen on a straightaway road there would be no danger to a good driver.

The practice of allowing so many entries on a short course of thirty miles is a dangerous one, Thery thinks. He says that only expert racing men should be allowed in such contests. He pointed out that in the races for the international cup only three drivers from each country were allowed, which assured the presence of experts. In Europe this year three big road races have been run and no one has been killed. If there are twenty-five or thirty cars in next year's Vanderbilt Cup race, a longer course than thirty miles will be absolutely necessary if accidents are to be avoided. Sufficient intervals should be allowed between the cars at the start, and five-minute intervals are better than intervals of but two minutes.

Thery said that it was no longer necessary for the mecanicien to hang out from the side of a car as corners were rounded, as the centre of gravity in modern racing cars is so low. Where formerly only the wheels on one side would be touching the ground when rounding corners at high speed, now all four wheels stay on the road. The main thing is to reduce the speed low enough that the corners may be rounded without skidding to avoid the great wear and tear on the tires when skidding. The limitations of tires were responsible for placing the weight limit of cars at 2,204 pounds, because if the racing machines were made any heavier no tires could be made that would stand the strain. If makers were allowed to increase the weight as they pleased, the result would be a lot of "monsters," as Callois called them, that would be only good for racing.

Thery is a powerfully built man of apparently twenty-five years. He has about as much of the proverbial French excitability as an ordinary cigar store wooden Indian. In a crowd he might be picked out as a centre rush on a college football team were it not for the small mustache he wears. He rarely smiles, but has a very pleasant expression. Callois is also a finely built man, and might be a model for a statue of a gladiator. In fact, both of them furnish strong evidence that all Frenchmen are not the puny creatures that so many writers would have us believe. They must return to France for the Paris show in December, but both of them hope to come back here in time to try for records on Ormonde Beach.

Thery has asked Manager Alfred Reeves of the Empire City track to give him an opportunity to meet some of the American drivers of racing cars. Both Thery and Callois had expected to give exhibitions at Brighton Beach on Saturday, but their racing machines will not arrive in this country in time for the race. Mr. Reeves told Thery that he would put on a series of races at the Empire City course on Election Day, November 8.

Dourdan's Much Diminished Glory.

Gone are the glories of the annual Dourdan record meet, its sensational speed flights a thing of the past. Time was when Dourdan was a name to conjure with, but the trials held there early this month attracted little attention, and the only additions to the record table were made in two motorcycle events.

After being postponed, the trials were held on Monday, October 3, on the famous Dourdan road, near Paris. The course was not in very good condition, and the best that the heavy racing cars—650 to 1,000 kilograms—could do was 0:25 1-5 for the flying kilometre and 0:52½ for the standing mile. Both these performances were made by Baras, who drove a Darracq car. The existing kilometre record is 0:21 3-5, made by Rigolly in a Gobron Brille car.

The motorcycle records referred to were both made by Lefranchi, in the class for machines under fifty kilograms. He reduced the flying kilometre record to 0:29 1-5, and the standing mile to 0:57 4-5.

New Body for the Nobleman.

There has been designed by the Paris firm of Kellner for an English nobleman a body which is described as a triumph of the coachmaker's art, as well as a type that is expected to meet with great popular favor during 1905.

It is a double phaeton "Roi des Belges" in form, though it possesses distinctive features of its own, principally in the shape of the side doors and back. It is painted white, and the inside cushions are covered with leather tinted electric blue. There is a removable hood, with side flaps, so that the benefits of a closed "voiture" may practically be obtained in a few moments.

"Twins" and "Triplets" in Tires.

One of the principal reasons why even solid rubber tires have proved unsatisfactory when fitted to vehicles carrying heavy loads was the rolling motion that set up with the progress of the vehicle, and especially in making turns. To eradicate this fault an English maker has introduced twin tires; the bulk of rubber in each tire is reduced, therefore the tendency to roll on the tire is less, and side slip is checked in its initial stages by the edges of the two tires instead of one. He has recently gone further and recommended and introduced triplet tires as being more economical than twins.

When the Battery is Dying.

One of the most misleading and unaccountable faults which may happen, and which the novice may encounter on the road and have trouble in locating, is that due to using a battery which is almost exhausted. Such a battery will give just sufficient current to enable the motor to be started readily, and will run it without misfiring, but immediately the engine is put to drive the car by letting in the clutch, the engine slows down and stops. On fitting a newly charged battery the trouble is at once remedied. The cause of stoppage very much resembles that caused by failure, temporarily or otherwise, of the gasolene supply to the carburetter, only in this latter case some popping in the carburetter will be heard before the engine finally stops.

Believes in the Front Drive.

Another believer in the theory that front driven cars are less liable to side slip than the regulation rear driven type is the Marquis de Chasseloup-Laubat, the well known French motorist. He also says that when completely locking the wheels the tendency to side slip is more considerable than when they are only partially locked. It is, he says, a grave error in driving to completely lock the wheels, even if it is a question of stopping as rapidly as possible.

F. P. Wonson, of Gloucester, Mass., will erect a building to be used as a garage, and equip it to repair and store automobiles.

The Value of the Sponge.

A good sponge, like a good brush, has a value to the carriage painter unexplained by the price paid for it. Nevertheless, a really good sponge has been an exceedingly difficult item of paint shop supplies to obtain during the last eighteen months. The complaint has been universal the country over, and the class of sponges reaching the average paint shop at a price per pound of not less than $1.50 has been of a quality to make a righteous man grieve. The carriage painter may not be deeply interested in ascertaining from whence the sponge supply is obtained, but of all men he is instantly alive, or should be, to the importance of carrying in stock sponges suited to his work.

A soft, fleecy wool or velvet sponge, tough and strong in texture, with a generous water carrying capacity, and quite free of minute shells and foreign accumulations, is the desired quality for carriage work. At a considerable advance in price, such sponges are the most economical to buy. All sponges should, as a matter of preservation and increased usefulness, be kept in dustproof compartments, and after use they should be thoroughly washed before laying away.

Some glues bear more water than others. Those glues which absorb most water are the best and make the very best glue joints. For glue to be at its very best, it is necessary that it should penetrate the pores of the wood, the more penetration the more substantial the joints.

Lubrication of the Crank Case.

After every five hundred miles of running it is advisable to examine the state of the crank chamber. If the oil in it is thick it should be drained off. It need not be thrown away, but if carefully filtered it can be used for filling axle boxes and large bearings. It must not be used again in the engine.

It is an excellent plan to fill up the crank chamber to the normal level with kerosene, run the motor for a few minutes and drain off. Kerosene will thoroughly clean out all the bearings. Generally speaking, the oil in the crank chamber should reach just above the lower nut securing the big end bearing. Before filling up the crank chamber with fresh oil, let the kerosene thoroughly drain out.

Advance of the Bucket Seat.

Even carriage makers, who are not inclined to look with partial eye upon automobile innovations, commend the bucket seat. Unknown to the carriage trade, it early made its appearance on automobiles, and while at first designed for racing cars, it soon found a place on touring cars and even runabouts. Snugly ensconsced in its capacious depths a driver may devote himself to the task of piloting his car without giving a thought to the security of his seat. His vis-a-vis—if he has one—never crowds him, nor does the absence of one affect him.

That Wonderful World's Eclipsing Flight

of Oldfield in the Peerless Green Dragon at Cleveland, Oct. 15th, was achieved with the aid of

G & J THREAD FABRIC TIRES

Ten Miles in 9 min., 17 1-5 sec.

First mile (standing start),	1.07	2-5	Sixth mile,	.54	4-5
Second mile,	.53	4-5	Seventh "	.54	1-5

TO ENCOURAGE TOURING CARS

French Promoters Grow Wise and Hedge Hill Climbing Contests With Restrictions.

Two great French hill climbing automobile races have yet to be run—Thierry and Gaillon—before the close of the season. Contrary to precedent, these trials will not this year be open to tourist and speed cars simultaneously. With the fast cars of to-day the hill of Chateau-Thierry would be dangerous and almost impossible, so that it has been decided to restrict the Chateau-Thierry race to touring cars, and the Gaillon to the speed tests. The Gaillon is a fine straight line, with no dangerous turnings like that of Chateau-Thierry.

The touring car race at Chateau-Thierry—a mile race—will take place on October 23. The motor cars will be classified according to the price of the chassis. First, open bodies; second, bodies completely covered. The price classification of the cars will be as follows: 1, chassis of less than £160; 2, chassis of less than £320; 3, chassis of less than £480; 4, chassis of less than £720; 5, chassis of less than £1,000; 6, chassis of less than £1,400; 7, chassis of more than £1,400.

The organizers, wishing to make of this a practical race, will thoroughly examine the competing vehicles to insure that real tourist cars are presented, and not racing cars rigged up with a more or less comfortable body. Each competitor must also produce a certificate from the maker certifying the cylinder capacity of the car and that it conforms with the commercial pattern. The maker will bind himself to sell similar cars at the same price. Under these circumstances it will be impossible to present a 40 horsepower as a 24 horsepower.

Lastly, in order to encourage the production of real touring cars, a committee will, before the race, award a special prize to the car which in each class appears to them to present the finest effect, both from the point of view of comfort and elegance. This prize will only be awarded if a winning car is classed in one of the categories.

Objecting to Spiked Tires.

The Board of Freeholders of Somerset County, N. J., will make an effort to have the next legislature enact more stringent laws for the regulation of automobiles on county roads. Complaints are reaching the Freeholders from all parts of the county that the macadam roads are being injured by the armored tires that are now being used on a number of the big cars. These tires, which are warranted not to slip, have steel spikes fastened to a heavy leather strap, which is vulcanized on the face of a rubber tire. When travelling at a high rate of speed these machines tear up the macadam roads. A number of roads in Bernardsville have been seriously injured, and it is presumed that the wealthy colony there has adopted the armored tires.

Adds Course of Automobile Study.

An automobile course of study has been established by the Cleveland (O.) Young Men's Christian Association. This course has been added to the scholar's curriculum on account of the success attained and the interest shown in the series of eight lectures given by the association last spring.

It is the object of the course to give a great deal of practical work in the way of assembling, repair work, and actual road practice. The elementary work will consist in the theory of the one, two and four cylinder, the carburetter, igniter transmission, gear and other accessory parts of the automobile. At different stages in the explanation of these parts, demonstrations will be involved. The advance work will be for machinists and draughtsmen who wish to study the construction and repair of machines.

Lectures will be given at the Y. M. C. A. building, while the practical work will be done at the Automobile Garage and Repair Company's, No. 404 Huron street.

Springfield Arranges for Instruction.

For the benefit and instruction of members of the Springfield (Mass.) Automobile Club, a series of meetings has been arranged, covering the details of construction of all standard makes of automobiles. The Knox Automobile Company has offered the use of its factory for an evening, and competent men to explain the construction of the different parts. The Springfield Automobile Company will also throw open its show for one night to allow the members to thoroughly inspect the Locomobile touring cars. A. A. Geisel will entertain the club in his automobile headquarters in Dwight street and show the Winton and Cadillac machines and Whitten & Clark will show the Oldsmobile and Autocar.

It is hoped to give the members a thorough working knowledge of automobile construction in these informal meetings.

Declares Six Mile Limit Unconstitutional.

Judge O. E. Heard, of Sterling, Ill., sitting in the Circuit Court, has declared a Dixon, Ill., city ordinance limiting the speed of automobiles to six miles an hour invalid and unconstitutional, and reversed a police court decision fining a speeding chauffeur $20. He declared the law void because unreasonable and oppressive, tending to create a monopoly in favor of means of travel. He intimated that an ordinance making the limit greater would be valid.

Detroit's Class Studies Steam.

Steam power for automobiles, with a White car as a model, was discussed at the last meeting of the Detroit (Mich.) Y. M. C. A. automobile instruction class. Instructor E. J. Stoddard described the working parts of this car as well as the principle of operation. Up to this time very little has been told of the steam machine in the class, the greater part of the study being given up to gasolene cars.

FOR VON HERKOMER'S CUP

Competition Postponed Until Next Year—Artist Donor With Paint Each Winner in Oil.

Gold and glory in almost equal portions will be the reward of the winner of the von Herkomer Cup, which will be competed for next year for the first time. The cup itself will be chased by Hubert von Herkomer, the celebrated artist, while its winner will be honored by the donor of the cup, who will paint his portrait in oil. As von Herkomer portraits are worth $20,000, this souvenir will possess rare value.

The von Herkomer Cup is offered as a prize in an international competition for touring cars. It was originally intended to inaugurate these competitions this year, but, owing to the lack of time for arranging the preliminaries it was put over until next year. The cup is to be worked in silver and enamel by the artist's own hands, and not only will have a high material worth, but will also be a highly valuable piece of art.

The prize cannot be competed for more than five times. Those winners who lose the prize again will receive special prizes, such as, for example, a special prize which has been offered by Dr. Magin, of Paris, worth M. 2,000 ($1,000).

The first competition will take place in Munich.

The Mayor's Heart-to-Heart Talk.

Mayor Raymond of Aurora, Ill., has adopted an unusual way of enforcing the ordinance in that city regulating the speed of automobiles. He recently called all the owners of these machines to his office for a general conference, and had a heart-to-heart talk with them regarding the law. The Mayor impressed upon his visitors the fact that the ordinances would be strictly enforced, and before the talk had ended had created a profound impression in them inds of his hearers.

The Up-to-date Orchestra.

Franklin, N. H., has an orchestra which travels from town to town in an automobile. The car is owned by and operated by Bradbury M. Prescott, jr., the director of the orchestra. It is a fast running vehicle, and has repeatedly carried the five men of the orchestra to Tilton, Bristol, Boscawen and other places, in what would seem lightning-like rapidity, when compared with the common methods of transportation over these highways.

Malone Sets Absurd Limit.

The village trustees of Malone, N. Y. have an ordinance restricting the speed of automobiles in the street to six miles an hour, and also requiring owners of automobiles which are kept for hire to pay a license of $10 a year and file a bond of $1,000 to secure the village against loss on account of claims for damages caused by automobiles.

Oshkosh Contributes a Ruling.

An unsatisfactory ending came last week to a case in the Oshkosh (Wis.) Municipal Court, in which the constitutionality of the local automobile ordinance was raised. The court failed to convict the motorist, on the ground of insufficient evidence, but it declared that the ordinance was constitutional, and stated that it would fine any offender against whom the evidence was clear.

The case was that of the city of Oshkosh vs. W. J. Campbell, the latter being charged with violation of the ordinance regulating the speed of automobiles. The defendant claimed that the ordinance discriminated in that it does not provide also that horses and carriages may not pass around corners at a rate of more than four miles an hour. The brief filed was exhaustive and comprehensive.

Judge Goss, in his opinion, said that he believes the ordinance is valid and does not discriminate, as claimed by the defence, as it provides for the regulation of all automobiles. There are features connected with the operation of automobiles which do not obtain with other vehicles. Horses do not travel at a rate of speed from thirty to fifty miles an hour, and the fact that bicycles and baby buggies, as well as horses and carriages, are not amenable to the same ordinance is not in itself a discrimination under the existing conditions.

The court said that he should enforce the ordinance, and, believing it legal, will pronounce sentence under it upon convictions found in his court.

To Institute "Religious Crusade."

James M. Little and J. Dwight Hogaman, who are said to be well known evangelists, of Toledo, Ohio, started last week on their evangelical tour of the world, to which they have attached the high sounding title of the "Automobile Religious Crusade." They began their labors in St. Louis, and will tour the Southwest, and expect to be back in Toledo next June.

Their trip will really not be entitled to the "automobile" part of its name until they leave Toledo next summer, as until then they will do their travelling by railroad.

Where "Slow Downs" Will Rule.

Chief Murphy, of Bay City, Mich., has been instructed by the Police Commission of that city to check reckless automobilists and make them conform to the ordinance. The commission adopted a resolution at its last meeting asking the Council to amend the present ordinance so that automobiles be compelled to slow down to three miles an hour when rounding corners, and that the slowing down must be commenced one hundred feet from the corners.

Queens Gets a Motor Ambulance.

The Health Department of Queens Borough, Greater New York, is contemplating great distances required to be covered entails too much work on the horses in use at present.

Accident Constituted "Wilful Assault."

Injuries resulting from disregard of the laws governing the speed of automobiles shall be sufficient ground for the recovery of damages, according to a verdict which has been returned by a jury in the Supreme Court at Ballston, N. Y.

The case in point was that of Charles Clement, a farmer, against Milton C. Hastings, a chauffeur for Edward Murphy, jr. Clement alleged that Hastings collided with his team, that the automobile was being driven at a reckless rate of speed, and asked that he be awarded damages for the injuries sustained as a result of the collision. In charging the jury Justice Spencer said that if Hastings was driving the machine at a rate of speed demonstrating reckless disregard of its proper use and was wantonly indifferent to the consequences that might happen to others, the act constituted a wilful assault on Clement and his property, and entitled him to damages.

The jury returned a verdict awarding the plaintiff damages in the sum of $600.

Here's a Deer Story.

One of the latest victims of the sustained speed of which an automobile is capable was a deer, which lost a long race for its life near Willows, Cal. Two men were riding in an automobile along the road near Jacinto when they saw a deer jump over a barbed wire fence and run along the road ahead of them. They gave chase, and, though the deer gained at first, it finally fell exhausted at the roadside, where it was killed by some hunters from the next town.

And Now the 'Possum Hunt.

A 'possum and 'coon hunt by automobile is the novel entertainment planned by the Houston (Tex.) Automobile Club. The hunt will be made by starlight, the party proceeding in automobiles to the woods near the rice farm of one of the members. Acetylene gas lamps taken from the automobiles will be used to search out the toothsome animals, and hounds will be there to run them to earth.

Exacts Numbers, but No Fee.

An automobile ordinance is engaging the attention of the Nashville (Tenn.) Council. As amended at the suggestion of the Nashville Automobile Club, it is a fairly innocuous measure. No speed limit is imposed, but each automobile is required to carry a number plate bearing figures three inches high. A penalty for non-compliance is provided, but there is no fee imposed for registration.

Excludes Automobiles from Public Road.

Haughtily disdainful of constitutions and statutes, the County Court of Grant County, W. Va., considered the best touring county in the State, has passed an order prohibiting automobiles running in the county. This action is the result of a number of accidents because of alleged reckless automobile driving. A penalty of $100 is named for violation.

Arkansas Applies for an Injunction.

M. F. Collier, a prominent citizen of Paragould, Ark., has applied to Judge Hughes, of the circuit court, for an injunction restraining the operation of an automobile on the streets of that city, on the ground that such a machine is dangerous to human life.

A horse pulling Mr. Collier's family surrey was recently frightened by Eugene Smith's automobile, with the result that the vehicle was overturned and the occupants injured. Hence the indignant Paragould man's action.

Commenting on the application, the Little Rock Gazette very sensibly says:

"We don't know what Judge Hughes will do about this application, but we do know that the automobile has come to stay and that it is going to increase and multiply. When bicycles were first generally ridden horses used to get conniption fits at the sight of them, but now a horse does not notice one of the man-propelled things. It will be the same way with the automobile. Horses will frighten at them for a while, but in the course of time this fear will be removed and horse and automobile will travel the same road together in peace and quiet.

"And by the time horses have gotten thoroughly broken to automobiles the flying machine may have been perfected to a point where it can be used to frighten the animal motors of terrestrial traffic."

Sacramento Wants Larger Tags.

The City Trustees of Sacramento, Cal., are considering a plan to make all automobiles carry large number tags so that they may be readily identified in case of an accident. One of the trustees is in favor of the plan, and proposes to also make visitors secure tags before being allowed to use the streets.

Anti-Horse Thieves Adopt a Resolution.

The National Horse Thief Detective Association, in convention assembled recently at Logansport, Ind., rose in all the majesty of its many syllabled title and adopted a resolution authorizing its national president to draft a law asking the Indiana Legislature to regulate the speed of automobiles.

Bryan's Baliwick Begins Legislating.

An ordinance has been introduced in the Lincoln (Neb.) Council requiring all automobiles to carry numbers, that they be restricted to nine miles an hour and five miles when rounding corners, and be made to carry lights at night and bells or horns to warn pedestrians.

Eu Claire will be Liberal.

City Attorney Wickham of Eu Claire, Wis., has been instructed by the council to prepare an automobile ordinance. It is expected that a liberal speed limit will be fixed; twelve to fourteen miles an hour is suggested.

To October 1 the Connecticut Secretary of State's office had registered 2,406 motor vehicles.

PREPARING FOR COLD SNAPS

Some of the Things That May Be Done to Prevent Damage—Warming the "Stable."

Frost has already made its appearance on several occasions, and in a very short time freezing weather may reasonably be looked for. Motorists should therefore be on the lookout for sharp snaps, especially on fine, cloudless nights. After the long spell of warm weather such precaution might be considered unnecessary, but that is where the damage to the cylinders and radiators lies, as one is apt to ignore the signs and tokens of approaching severe weather.

In the case of the more affluent motorist who can afford to fit up the motor house with special warming apparatus no trouble need be feared, and in some cases a branch pipe can be run with little expense from the greenhouse heating system, or a slow combustion stove be fitted up under a galvanized iron cover immediately outside the house, and the flue taken through it, the products of combustion being expelled where it passes out at the other side of the building. It is not necessary to obtain a high temperature, for so long as it is kept two or three degrees above freezing point there is no danger of freezing up the water circulating system of the car. The use of oil or gas stoves is not to be recommended in motor houses, as if there is any leakage of gasolene the vapor is likely to become ignited and cause damage to the car and house.

Where the motor house occupies a sheltered position, and the temperature hovers about freezing point, a good thick sack or rug may be thrown over the radiator and bonnet; this will prevent a rapid fall of temperature, and in most cases prevent the freezing up of the radiators, although it is not absolutely infallible. As but a small quantity of water is now carried in most types of cars, there is very little trouble involved in running off the water every time the car is to stand for any period, so that perfect safety is insured.

The Brazing of Joints.

There seems to be some misunderstanding in connection with the belief that joints in the pipework of automobiles break at the terminal collars, owing to neglect in annealing after brazing. A brazed joint is the softest place on a pipe, but it should be the strongest provided it has been properly brazed, and not burned by being overheated while brazing. Another defect, and not an uncommon one, is the unsuitable material that is used for brazing purposes. Unfortunately, the most common defect about motor car pipework is the scarcity of practical workmen—men who understand what a brazen joint should be when done properly, and that it does not require annealing. Ninety-nine out of every hundred so-called pipe braziers know very little about a sound brazed joint on brass or copper pipes, let alone if the pipes are of suitable material for brazing, and whether they will stand the work which the joints are expected to stand. Slack fitting unions with coarse threads are a great source of annoyance on most cars, and no union joint is reliable that has a greater pitch of thread than nineteen or twenty threads to the inch. The male end should have a good shoulder, and the nut should have a correspondingly good collar inside and be a good fit on threads from top to bottom.

Two Evidences of Inaptness.

One occasionally comes across car owners of some experience—men, too, who affect to be particularly keen upon mastering the technique of their automobiles who have not acquired such rudimentary skill as is involved in changing gears without looking down to see when the level is alongside a notch in the quadrant. It may be excusable for absolute beginners to do this, but it is an extremely dangerous practice when driving in traffic to take one's eyes from the road in order to look down at the quadrant when changing gears. Particularly at night time should the practice be avoided, so that the dodge of rigging up an electric lamp in a position where it will illuminate the quadrant must be regarded as the invariable sign of the clumsy beginner.

Another little item of great importance which is often overlooked has relation to the adjustment of drip lubricators. The practice is too common of leaving these appliances just as received from the makers, with the result that the frequency of the dripping varies in accordance with the viscosity of the oil used. A lubricator may be set to accurately supply a sufficient and not excessive quantity of one particular kind of oil, but when upon a journey some different brand of oil may be purchased, which will not drip through the orifices of the lubricators with anything like the freedom of the oil for which the lubricators have been adjusted, with the result that the engine receives an inadequate supply; or an oil of a much lighter body may be purchased which will drip through so rapidly as to smother the sparking plugs and valves.

To Grasp the Starting Crank.

In the hands of inexperienced or careless motorists the starting crank is a real peril. Within a week or two an ex-Secretary of the Navy had his arm broken in two places, while a Philadelphia motorist who was driving the Archbishop of Canterbury suffered a fracture of the wrist, both accidents being dut to the recoil of the crank.

If motorists would be exercise a little care such mishaps as these would not occur. There is a right as well as a wrong way to grasp the crank handle, for example. The right way is to hold it so that the knuckles will be under the handle and the arm out of range of the latter in case it should unexpectedly fly back. If this is done the fingers will involuntarily unclasp sufficiently to release the handle, which will then swing around without doing any damage.

VAN WESTMAN ON DUST

Whilst Tooting His Own Horn He Deals With the Subject Interestingly and Instructively.

One of the topics which was discussed at considerable length at the recent German automobile Congress, held at Breslau, was that relating to dust on roads. An exhaustive paper on the subject was read by Herr L. Van Westman, the inventor of the dust preventive, of Westrumite, in which he adduced proof in support of his contentions that this substance when applied to the roads injures neither rubber tires nor the varnish on vehicle bodies and other parts. Excerpts from the paper are appended:

"I believe that if it were possible to make streets entirely dustless the lives of millions of unfortunate consumptives might be saved. The material damage caused by dust to furniture, machinery, provisions, etc., is impossible to estimate.

"Furthermore, real estate located on roads with much traffic depreciates in value in the course of time on account of the dust nuisance. The dust produced by the increasing traffic deprives many otherwise fine resorts of the advantage of a pure atmosphere. On the Riviera, for instance, it may be observed that trees and plants far into the gardens are entirely covered with a gray coat of dust. The pleasure drives, which were formerly so popular, have been almost entirely discontinued because it is no pleasure to drive in a dense cloud of dust. As the dust is largely a portion of the street material and the latter is reduced by its removal, it follows that any process for binding the dust will tend to preserve the road surface. When this fact is once thoroughly understood by the authorities, we may hope to see the dust disappear from the streets within a definite time. Too much cannot be said against the practice of sprinkling streets with water, quite common everywhere, because water spraying loosens and destroys particularly macadamized streets, and produces a soft mud which may prove very dangerous to automobiles and horse riders, and the removal of which is expensive.

"The widespread impression that dust is produced only through the wear of the surface layer of the street is entirely wrong. By far the greater portion is due to the fact that the pressure of traffic forces the heavy stones down into the road and allows the lighter material, sand pulverized to dust, to rise, from which result the holes in the street surface which are a source of expensive repairs. The abatement of the dust nuisance may practically be divided into two parts, viz.: (1) The suppression of dust on the surface; (2) binding the paving material either during construction or during repairs. The first operation consists in sprinkling the streets with suitable fluids. We need, how-

Digitized by Google

ever, not delude ourselves that the nuisance will be obviated by this means to any extent, because only the cities which dispose of large appropriations for street watering purposes are able to take up this problem, they spending a great deal of money in keeping the streets sprinkled, and by using suitable dust binding fluids they might save sufficiently on wages that the introduction of the improved method would only occasion a very slight increase in the annual expense account.

"I now arrive at the second question, which will be of much more interest to automobilists: How can country roads be rendered free from dust? Theoretically this end may be accomplished by the same means by which city streets are kept dustless, but practically these means are inapplicable, because the provincial authorities concerned can hardly be expected to make the necessary appropriaations. The only way of accomplishing any beneficial results is to improve the methods of road construction. With the present method of building highways, which consists in compressing stone and sand with water by means of steam rollers, there can be no possibility of binding these materials together. Traffic will in time pulverize the sand and force it to the surface, with the result that the road is not very dusty, but also in need of repairs.

"It will hardly be possible to use other materials than oil and tar for binding dust, for the simple reason that there are no other materials of equivalent effectiveness which are to be had as cheaply as crude oil and tar. All the experiments have shown that oil and tar have a very powerful binding effect, if it is only possible to completely saturate the sand and stones with them. The methods just described are, as stated, too bothersome, expensive and dependent on weather conditions, and require that streets treated must be closed to traffic for long periods. There is, however, a very simple method of securing the full benefit of the properties of tarry and oily substances and avoiding their disadvantages, and this method consists in making these substances soluble in water, in which case they will be eagerly absorbed and strongly bind the street paving material into an elastically compact mass. The solutions may be spread on the roads by an ordinary sprinkling wagon, and if the work is done at night the streets need not be closed to traffic. Care must, of course, be used that the oil or the tarry emulsion becomes insoluble after the evaporation of the water, because otherwise it would be dissolved and washed away by the next rain. The insolubility must, however, not be so complete that the substance is entirely incapable of absorbing water, but it must always retain the property of taking up enough rain water to bind any new formed dust. This is the only means of preventing the production of mud, as the rain not absorbed will quickly run off, and the rest form an emulsion and bind the dust.

"Practice has proved that roads thus treated dry much quicker after a rain than ordinary roads, and that there is no formation of mud, as in case of water sprinkling or after a heavy rain. Now, if in the construction of a new road, either macadam or stone pavement, all the sand employed is saturated with this emulsion, it is bound together so effectively that it is impossible for the pressure of traffic to force it to the surface, and this already results in a considerable reduction of dust, as the production of dust by the wear of the upper surface, especially from automobile traffic, is very small. The development of dust through automobiles does not result from the wear of the stones contacted—the tires being entirely too soft to produce any wear on stones—but results from the vacuum formed behind the contact of the wheel with the road surface, which sucks the sand from between the stones, no matter whether it is a macadam or stone paved road. If, with the increasing automobile traffic, especially on the country roads, no efforts are made to provide an efficient binding material, it may be predicted with assurance that in future the life of the roads will be greatly reduced, because the extraction of the filling material sand from between the stones will naturally ruin a road much quicker than the surface wear from horsehoofs and iron tires.

"There is at present certainly no longer the least doubt regarding the rapid introduction of automobiles on a large scale, consequently the authorities intrusted with the care of the roads must get used to the idea that they have to count with motor cars as a factor entitled to the use of the roads. The latter exist for traffic purposes, and in case the means of traffic are changed the roads must be made to conform to the new requirements. Many rural and urban authorities have already begun to replace the otherwise very satisfactory macadam pavement with stone pavement, because it is more resistant to heavy traffic. But from the standpoint of the public this is very much to be deplored, because the stone pavement has not only the disadvantage that it disables horses in short order, but also causes much annoyance to every one using the road or living near it, owing to the great noise produced. Besides, it is not exactly a pleasure to drive over such a pavement, whether with an automobile, bicycle or horse drawn vehicle, in case it is not absolutely uniform. This much to be desired uniformity will, however, hardly ever be secured on a country road. Automobilists are, therefore, much interested in the retention of macadamized roads; only they should be made dust free and durable, because the dust and the many holes are the great disadvantages of a pavement which otherwise combines all desirable qualities, being almost noiseless and much more uniform than stone pavement.

"As it has frequently been claimed that Westrumite has an injurious effect on the varnish of carriages I would like to present an opinion from the noted chemist Dr. C. Bischoff, of Berlin. In connection with this opinion, I would remark that it is, of course, to be recommended to drive slowly over a road only recently treated. This is a matter of little moment, as the drying requires only a few hours, so that there can be no question of traffic delay. Fears have also been expressed that Westrumite might be harmful to rubber tires. I have before me a letter from Herr Tischbein, of the Continental company, which is to the effect that these fears are unfounded. The Cyclist Touring Club, in Holland, has made extended experiments at its own expense in different cities, and sent a report to the Mayor of Nymegen which was entirely favorable to the use of the emulsion. According to these several statements, it is shown that (1) Westrumite binds the dust and does not occasion too great expense as compared with water sprinkling; (2) no mud is formed during rain; (3) it does not injure the varnish of vehicles; (4) it has no injurious effect on rubber tires, but, on the contrary, preserves them; (5) it has an appreciable saving and preserving effect on roads; (6) it kills weeds, but has no bad influence on trees, bushes or other plants."

Explosions in Exhaust Box.

The motorist who is his own mechanician frequently experiences considerable perplexity by reason of the eccentric behavior of his foot brake, which will one day act with disconcerting fierceness, and the next fail to exercise any retarding influence upon the car. The explanation usually is that oil has got splashed on to the foot brake; but sometimes it happens that the most scrupulous cleanliness fails to make a brake bite, or, on the other hand, liberal lubrication of oil fails to make a brake act with the smoothness that is desirable. Roadside adjustments frequently result in accentuating the evil. The latter state of affairs is usually occasioned in the case of foot brakes of the most frequently adopted pattern by ignorance of the circumstance that there are two separate adjustments possible, in addition to the adjustment of the rod immediately connected to the pedal lever. One adjustment is in the long horizontal rod which passes back under the footboard to the brake band; the other adjustment is on a short rod attached to the brake band itself. To make the action less fierce, the adjustment of the short rod should be lengthened out, and the adjustment of the long horizontal rod should be tightened up, which will enfeeble the action of the brake; and, per contra, to make the brake act more vigorously, the long horizontal rod should be lengthened out and the short rod on brake band should be further attenuated.

The Components of Westrumite.

Most people have heard of Westrumite, the dust-laying preparation which has been much used abroad, but few know what it is made of. This material is a brownish liquid, containing 60 per cent of crude petroleum, 34 per cent of ammonia and some other chemicals more or less optional. Leonard Schade Van Westrum, of Berlin, is the inventor. When ready for use it is mixed with from nine to eighteen parts water and sprinkled over the streets.

The Week's Patents.

771,631. Igniter for gas or gasolene engines. Peter P. G. Hall, jr., Philadelphia, Pa. Filed November 19, 1902. Serial No. 131,921. (No model.)

Claim.—1. An igniting device comprising a tubular plug adapted to enter the wall of an engine cylinder and formed with an enlarged chamber communicating with its bore exterior of such cylinder, a firing pin passing through said plug, its uncovered inner portion being spaced away from the walls of such bore, a body of insulating material interposed between a portion of said pin and the wall of said chamber and between said insulating body and the end of such bore.

771,651. Wheel. Edward S. Lea, Rutherford, N. J. Filed January 16, 1904. Serial No. 189,298. (No model.)

Claim.—1. In a wheel, a tire comprising a plurality of sections pivoted directly to the rim of the wheel, each section being independent of the other sections, and means to cushion each section against the rim.

771,674. Fastening device for pneumatic tires. Thomas Sloper, Devizes, England, assignor to Christian Hamilton Gray, Silvertown, Essex County, England. Filed March 12, 1904. Serial No. 197,867. (No model.)

Claim.—1. In a tire fastening device the combination of a wheel felly, a metal band secured to the periphery of the felly and projecting laterally beyond the same, each lateral projection having a longitudinal groove on the inner side, detachable annular side plates one on each side of the felly and projecting from the same toward the lateral extensions of the peripheral band, these projecting portions having each a longitudinal groove on that side toward the band, a double bead to each edge of the tire cover adapted to lie in the space between the felly and projecting portions of the band and side plates while the bead enters the grooves, and means for holding the annular side plates in position, substantially as set forth.

771,683. Electric ignition device for internal combustion motors. Charles W. Svenson, New Britain, Conn., assignor to the Corbin Screen Corporation, New Britain, Conn., a corporation of Connecticut. Filed June 17, 1903. Serial No. 161,829. (No model).

Claim.—A spark plug of the character described, comprising a relatively stationary annular member, a rod mounted longitudinally thereof, and a revoluble disk having a plurality of sparking points carried at the outer end thereof adjacent to the annular terminal.

771,947. Vehicle tire. James A. Swinehart, Akron, Ohio. Filed November 23, 1903. Serial No. 182,258. (No model.)

Claim.—1. The tire and a core therefor adapted to be changed in character by the application of heat, and means within said tire to heat said core, substantially as described.

771,985. Carburetter for gasolene engines. George Kingston, Kokomo, Ind. Filed August 12, 1903. Serial No. 169,283. (No model.)

Claim.—1. In a carburetter, a mixing chamber having inlet and discharge ports and provided at one side with an opening, a ported valve arranged within the mixing chamber, a gasolene supply pipe extending within the valve, and a removable nozzle member extending through said opening to the gasolene supply pipe, said nozzle member having its outer end closed and being provided with a port for discharging a spray of gasolene within the mixing chamber.

772,030. Apparatus for loading motor vehicles. George H. Condict, New York, N. Y., assignor, by mesne assignments, to Merton Trust Company, trustee, a corporation of New York. Filed January 3, 1899. Serial No. 700,898. (No model.)

Claim.—1. The combination with a vehicle

to be loaded and a laterally movable loading table adapted to sustain the vehicle and having a rotatable portion upon which the vehicle rests, a means engaging the vehicle and acting to turn it and the table into position parallel therewith and for moving the vehicle and table laterally into desired position.

772,071. Steam boiler. John J. Tonkin, Oswego, N. Y. Filed February 17, 1904. Serial No. 194,022. (No model.)

Claim.—A steam boiler comprising two water legs extending directly across the ends of the boiler and formed with flue sheets at their inner sides, longitudinal water tubes connected at their ends to said flue sheets, rollers supporting one of said water legs, a steam and water drum superposed on one of the water legs and communicating therewith, and a water circulating pipe extending from said drum to the water leg at the opposite end of the boiler and deflected intermediate its ends to yield to longitudinal strain as set forth.

772,123. Lead containing cell for secondary batteries. Vincent G. Apple, Dayton, Ohio. Filed June 3, 1903. Serial No. 159,838. (No model.)

Claim.—1. As an article of manufacture, a lead containing cell for secondary batteries whereof the containing wall structure is thinner and denser than ordinary cast walls, formed in a single piece without seam or joint, or lead, cast under pressure while in a softened or molten condition.

772,178. Cooling mechanism for explosive engines. Frank Reaugh, Oak Cliff, Tex. Filed May 8, 1903. Serial No. 156,175. (No model.)

Claim.—1. An engine having walls arranged within the cylinder and practically separating the interior of the cylinder from the interior of the crank case, the said walls forming spirally disposed air passages, one of said passages leading to the interior of the cylinder and admitting air to cool the piston, the other passage leading from the interior of the cylinder, and valves commanding said passages, the air circulation through the passages being enforced by the piston movement.

772,198. Vehicle. Joseph A. Williams, Cleveland, Ohio. Filed June 16, 1904. Serial No. 212,796. (No model.)

Claim.—1. The combination with a frame of an axle rotatable therein, wheels movable upon the axle but constrained to rotate therewith, an annular guide member pivoted about a fixed point upon the frame, and an annular projection from the wheel coacting with the guide member.

772,199. Vehicle. Joseph A. Williams, Cleveland, Ohio. Filed June 16, 1904. Serial No. 212,797. (No model.)

Claim.—1. The combination with a frame of an axle mounted to swing thereon, a vehicle wheel rotatable about the axle, driving teeth in rotatable engagement with the wheel, and means carried by the frame for guiding the teeth.

772,209. Wheel rim. Richard S. Bryant, Columbus, Ohio. Filed February 23, 1904. Serial No. 194,666. (No model.)

Claim—In a wheel rim, the combination with the rim body having a key channel in its outer face adjacent to its edge, of a detachable tire retaining ring adapted to be mounted on said rim above said channel, said retaining ring having an angular recess in its base as described, and a broken locking ring adapted to engage as described said tire channel and said retaining ring recess.

772,214. Engine and gear casing. John Carney, Waltham, Mass. Filed February 11, 1904. Serial No. 193,172. (No model.)

Claim—1. An engine and gear casing comprising, an engine covering, a chain cover and a sprocket wheel covering, and means for removably connnecting said coverings together to form a complete casing for said parts, substantially as described.

772,235. Electric Igniter for Explosive Engines. William B. Hayden, New York, N. Y. Filed February 15, 1904. Serial No. 193,620. (No model.)

Claim—1. An electrical igniting device for explosive engines, comprising a movable contact block, a pair of yielding contacts co-operating therewith, suitable electrical connections for the block and contacts, and means for elevating and lowering said contacts, thereby varying the time of ignition of the explosive charge.

772,270. Self-Propelled Vehicle. Harvey Beckwith, Oakland, Cal. Filed March 24, 1904. Serial No. 199,845. (No model.)

Claim—1. The combination with a vehicle having a supporting drive wheel, of a power shaft, a sprocket wheel or gear upon said shaft provided with teeth or projections upon its periphery and its sides, and a flexible endless belt passed about said sprocket wheel and said supporting drive wheel, said belt comprising loosely connected slats having projections to enter the spaces between the teeth on the periphery of said sprocket wheel and projections to both guide said belt and wheels into engagement with each other and enter the spaces between the teeth upon the sides of said sprocket wheel, substantially as described.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

Eccentricities of Foot Brake.

A motorist tells of a companion who, on a tour, alarmed the countryside by frequent explosions in the exhaust box. After listening to it for ten miles he dismounted and searched unsuccessfully for the cause. It puzzled him, because the spark of the plug looked so regular and strong, yet somehow the charge sometimes escaped ignition, with the not uncommon result of the flame from the next explosion igniting it in the exhaust box.

tI should be borne in mind that a spark in the open does not necessarily mean a spark in the cylinder, and that the space between the plug points consists, at the instant of sparking, of gas under high compression through which even the powerful secondary current finds resistance enough to prevent it from crossing over and causing its own tiny flame to explode the charge.

In the present case the driver did not set the plug points closer, for he knew the current itself was as powerful as before the trouble began. He set the trembler contact closer and that ended the missing. It is possible for the contacts to be set too nicely, so nicely that a slow movement may complete the circuit when a rapid one will occasionally fail to do it. Here is where the less experienced may easily have gone wrong. He might have set the plug points closer, when the missing would also probably have ceased, and been pleased with himself, without having detected the loss of power which must have ensued from a diminished spark. Nicety of adjustment increases power.

A Sharp Eye Ahead!

EYE-FIX

TRADE MARK

THE GREAT EYE REMEDY

Driving an auto will be more of a pleasure and less of a strain on the eyes if you use EYE-FIX. This tried and true remedy strengthens weak eyes, cures watery eyes and allays irritation caused by wind and cold. It is an effective tonic for eyes that are dull, tired or overtaxed—makes them bright and clear—removes the aches and pains. Quickly cures sore eyes and instantly soothes eyes that are injured by particles of dust, etc. Carry EYE-FIX in your pocket, a small vial and a dropper in a neat case. Use it in a jiffy—two drops is a dose. All druggists and opticians sell EYE-FIX at **50c.**

Every dealer in automobiles and sundries should have EYE-FIX in stock. He will find a good sale for it among his patrons.

Inquiries cheerfully answered, and we send a trial bottle, post-paid, for 10c.

EYE-FIX REMEDY CO.,

WHITLOCK COOLERS

For 1905.

Experiments are Expensive.

Sometimes they are not only expensive, but fatal. This is especially true in motor car construction. It is, therefore, always on the side of safety and good judgment to adopt those parts which have stood the test of time and have acquired for themselves a reputation based upon actual merit Price is not always the most important consideration.

Therefore, in deciding what cooler you will use for 1905, select one with a reputation.

The Whitlock Cooler has stood the test of time. It has been used for two seasons by the majority of American builders of touring cars. Our experience in this line is now unequalled. Write us about your cooler proposition.

HARTFORD, CONN., Oct. 13, 1903.

THE WHITNEY MFG. CO.,
Hartford, Conn.

DEAR SIRS: Answering your inquiry, we take pleasure in advising you that our 24 H. P. Columbia Touring Car, which covered 1177 miles between Chicago and New York City, in 76 hours, establishing the most important and valuable automobile record to date, was equipped for the run with your 1¼ inch Pitch, light model Roller Chains. We are also pleased to inform you that a single set of these chains on another of our cars has given upwards of 12,000 miles of service without serious deterioration. All the Columbia gasolene cars sold this year have been furnished with "Whitney" Chains, and we have yet to hear of a case of breakage or other "chain trouble."

Yours very truly,
ELECTRIC VEHICLE COMPANY,

Oldsmobile

The Best the Field Affords

By Reason of

1—Oldsmobile motor—ripe product of over twenty years successful experience.

2—Simplicity of mechanical construction. The absence of all gaskets. Cylinders and cylinder heads cast integral. Bearings self-oiling; cam shaft gearing entirely encased.

3—Easy to start—absolute impossibility of "kicking back" in starting.

4—Style, comfort, power, plenty of speed.

5—Light Tonneau Car equipped with tilting steering post, divided front seat, honey-comb radiator, etc.

On the recent Automobile Tour—from New York to St. Louis—the Oldsmobile Tonneau Car easily held its own with cars costing from three to fifteen times as much. It maintained an average speed of twenty miles an hour over the entire trip.

Oldsmobile Standard Runabout, $650.00; Oldsmobile Touring Runabout, $750.00; Oldsmobile Light Tonneau Car, $950.00.

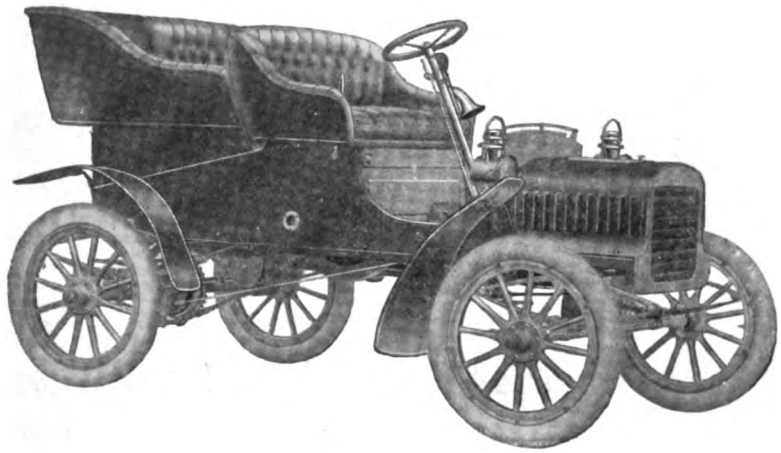
The FORD 1905 Cars



MODEL B. Price, $2000.00.

HENRY FORD'S LATEST AND GREATEST SUCCESS.

Our 1905 Touring Car weighs only 1710 lbs. The 4-cylinder vertical motor develops over 20 horse power, SO THAT THIS CAR HAS MORE POWER FOR ITS WEIGHT THAN ANY CAR IN THE WORLD.

Wheel base, 92 inches; direct drive, with universal coupling; cylinders, 4 x 5, water cooled; automatic oiling device with force feed; large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car place this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horse power, planetary transmission, chain drive, and increased gasoline capacity. The most stylish, low-priced car on the market.

THE Incomparable White

Some Cups Won

in Stock Races.

Races, and other competitions which are confined to stock cars can not fail to have more interest for motorists than any other motor competitions. The reliability of the WHITE Steam Car has been so repeatedly proven in official trials, both at home and abroad, that it has become a generally accepted fact all over the motor world that the WHITE is a really reliable motor car. The speed of the WHITE is now frequently claiming attention, and recent victories of the WHITE Cars in stock races in St. Louis, Pittsburg, Monterey and Kansas City, all point one way—to the speed of the WHITE Steam Cars on the road and on the track.

WHITE SEWING MACHINE COMPANY, CLEVELAND, OHIO.

Less than One-Half of One Cent per Mile for Repairs.

Detroit, Mich., Sept. 2, 1904.

CADILLAC AUTOMOBILE CO.,
Detroit, Mich.

Gentlemen: On the 25th of April, 1903, I purchased through your sales agent, Wm. E. Metzger, Cadillac No. 183, which I think was one of the first machines you manufactured. Since that time I have driven it something over 14,000 miles, and my repair bill in that time has been a little less than $60.00.

I want to thank you for the courteous way in which you have always treated me, and if your model D machine is as good as the Model A, you can consider my order placed now.

Very truly yours, (Signed) ARTHUR A. PALMER,
Adrian, Mich.

A good Operator can run a CADILLAC several seasons at small cost for repairs if he will take the proper care of his machine. The exclusive selling right for the CADILLAC line for 1905 may be open for your vicinity. Do you want it?

DAD SAYS HE'S NOTICED THAT EVERY TIME A FELLOW STARTS USIN' MORGAN & WRIGHT CLINCHER TIRES HE QUITS TALKIN ABOUT HIS TIRE TROUBLES

HAYDEN AUTOMOBILE CO.
CHICAGO.

MORGAN & WRIGHT,
CHICAGO.

Gentlemen:—We beg to advise that the set of Clincher Tires purchased of you have been used on our demonstrator and have given the very best of satisfaction. **We have run these tires sixty-five hundred miles without having any trouble whatever other than an occasional puncture,** and at this time they are apparently as good as new, except for slight wear on the tread.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

PREMIER

AIR COOLED. DIRECT RADIATION.

The following letter speaks for itself.

Chicago, Sept. 12, 1904.
PREMIER MOTOR MFG. COMPANY,
Indianapolis, Ind.

Gentlemen—I wish to take this opportunity to tell you that I am more than satisfied with my machine. It has averaged seventy-five to a hundred miles daily since I purchased it. On the hottest day of this season—July 15th—Mr. George Elmslie and myself left Chicago, making a run of one hundred and thirty-eight miles without a stop save for luncheon.

I have made two trips to Oconomowoc without stop and return, and have stopped but twice or three times for insignificant repairs since using it.

I have had a great deal of experience in the last five years, and have decided that this is the best machine for my daily work and pleasure. All I need now is a coupe top for Winter work.

Cordially yours,
F. H. BLACKMARR, M. D.,
40th & Cottage Grove Ave.

Suit Against Michelin Tires

We beg to notify the trade that we have commenced suit against the United States Agency Michelin Tire Company for infringement of our letters patent on Clincher Automobile Tires, and desire to warn the trade against the purchase of such tires.

The following concerns are operating under licenses granted by us:

The Hartford Rubber Works Co.
Morgan & Wright.
India Rubber Co.
B. F. Goodrich Co.
Diamond Rubber Co.
Fisk Rubber Co.
Goodyear Tire & Rubber Co.
International Automobile & Vehicle Tire Co.
Continental Caoutchouc Co.

A Grand Prize

Has been awarded by the Juries of the Louisiana Purchase Exposition Co. to

THE GEORGE N. PIERCE CO.

On its exhibit of

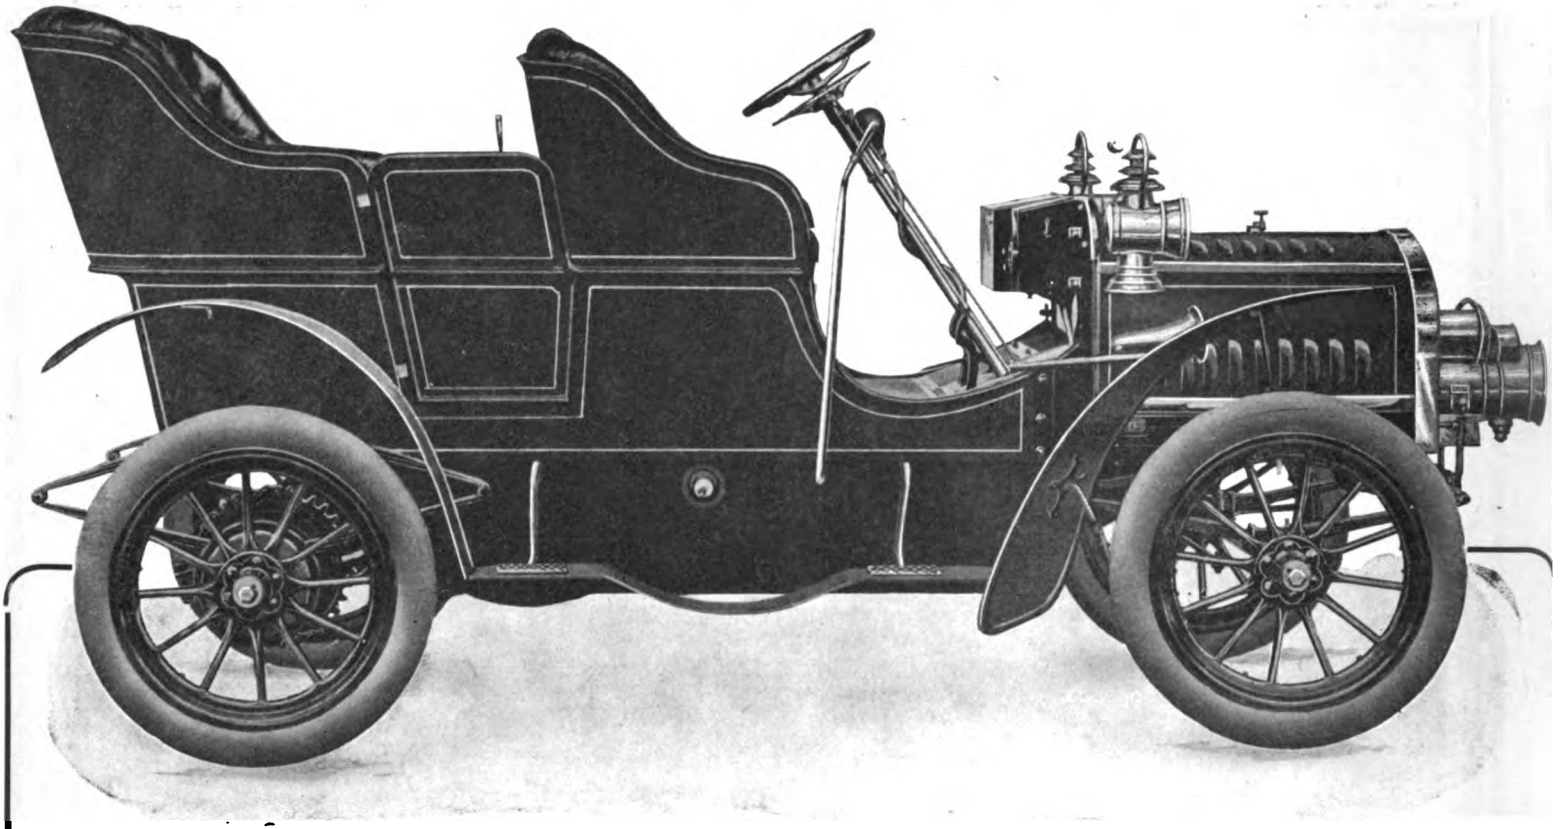
Pierce Automobiles

In recognition of superior quality in workmanship and materials, together with correct engineering and design.

The PIERCE Line for 1905 will include

PIERCE Stanhope, 8 H.P. - - $1200

Great Arrow, 24-28 H.P., Side Entrance, $3500



Great Arrow, 28-32 " " " $4000

Dealers can secure this splendid line now for all unoccupied territory and correspondence to this end is solicited.

The Reliable Rambler Surrey

Type One. 1905 Model.

Two Cylinders. 16 H. P. Immediate Delivery. $1350.

In the race at Rockford, Illinois, October 8th, a RAMBLER, 1904 model, with two cylinders, won a mile race from a 1905 model of another make with four cylinders and nearly twice the rated power.

Time, 1:17 2-5 vs. 1:19.

RAMBLER'S rated power.

Other car's rated power.

RAMBLER'S cost.

Other car's cost,

and yet the RAMBLER is not designed for speed, but for practical work—for use on rough roads and hills.

The working idea of the RAMBLER factory is simplicity—the putting together of mechanism that any one with good sense can manipulate. This at the lowest price consistent with good workmanship—a price much lower than other manufacturers', because of our enormous output, which makes possible a great buying power and the employment of each man and each machine for one detail only.

Let us tell you more about how the RAMBLER is built—and enjoyed.

THOMAS B. JEFFERY & COMPANY,

BRANCHES: BOSTON, 145 Columbus Avenue. CHICAGO, 304-306 Wabash Avenue. PHILADELPHIA, 242 North Broad Street.

Volume IX. New York, U. S. A., Thursday, October 27, 1904. No. 5

ALLOTTING SHOW SPACE

Great Demand Will Render Paring Necessary—How Distribution Will be Made.

In the allotment of space for the forthcoming show at Madison Square Garden, this city, preference will be given, first, to exhibitors who are members of the National Association of Automobile Manufacturers, and, second, to those members who have been most consistent exhibitors at previous shows. That is to say, the members who have exhibited at the four previous shows—those of 1900, 1901, 1903 and 1904—will be given preference over other applicants, while those who exhibited at three shows will be next preferred, and those who had space at two and one previous show, respectively, will be favored in that order.

The allotment for the New York show will be made on Monday next, and that for the Chicago show on the following day, Tuesday. Already sufficient applications are in hand to render it certain that the crowding at Madison Square Garden will be as great as it was last year, in spite of the increased space that will be available. Some disappointments will be experienced, and the task of reconciling the conflicting claims and of cutting down the amount of space wherever possible is certain to be a huge one. Where applicants who have exhibited at all four shows do not conflict with each other, they will be allotted the spaces they ask for. The three-show exhibitors will next be taken up and be apportioned spaces where there is no confliction, and so on down the line. The allotment will be made by S. A. Miles, representing the N. A. A. M.; J. C. Young, on behalf of the Madison Square Garden Association, and General George Moore Smith, for the Automobile Club of America.

On Monday also the allotment of the 10,000 square feet of space awarded the Motor and Accessories Manufacturers will be made by the committee of that organization.

Applications for 165 spaces at the Chicago show have been received, and nearly a dozen prominent concerns that will also be represented are yet to be heard from. This rush for space at the Windy City exhibition is not causing any uneasiness, however, as the floor space available at the Colisseum is so large that little difficulty in accommodating all applicants will be experienced.

Fisk's Western Office Opened.

The Western sales office of the Fisk Rubber Co., the decision to establish which was exclusively noted in the Motor World and which represents no small departure, has been formally opened at No. 52 State street, Chicago. As was previously stated, it will be under the management of Frank C. Riggs.

The new office will handle all Fisk business in the following States: North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, Indiana, Indian Territory, Texas, Minnesota, Iowa, Missouri, Arkansas, Wisconsin Illinois, Michigan, Kentucky, Ohio, West Virginia and lower part of Pennsylvania.

Knox Steps Down and Out.

Harry A. Knox, vice-president and mechanical head of the Knox Automobile Co., has resigned those offices, disposed of his holdings and is no longer connected with the concern in any capacity. James H. Jones has been promoted to the post of chief engineer. It is stated that Mr. Knox, the inventor of the new well known air-cooled car bearing his name, "feels that he has earned a long vacation, and intends to take one before again engaging in active business."

Rogers Completes Organization.

The organization of the Rogers Automobile Co., of Springfield, Mass., has been completed by the election of the following officers: Louis F. Ivers, president, and Charles M. Woodward, treasurer. The concern is considering the purchase of a site in West Springfield, upon which to erect a plant.

Berkshire Will Build New Factory.

Factory buildings, to cost $10,000, will be erected by the newly incorporated Berkshire Automobile Co., of Pittsfield, Mass. It is expected to be ready for occupancy in December. Gasolene cars of 12 and 20 horse power will be made.

RAISED THREE MORE

St. Louis Exposition Revises Awards and Big Makers Benefit—Gold Will be Bronze.

As the result of a "second think" on the part of the Superior Jury of Awards, the number of automobile manufacturers to receive grand prizes from the St. Louis Exposition has been increased from five to eight.

The three who benefited by the maturer consideration of the jury were the Electric Vehicle Co., the Winton Motor Carriage Co. and the Packard Motor Car Co. Originally the Electric Vehicle and Packard had been allotted gold medals and Winton a silver one.

The other recipients of grand prizes were, as the Motor World was first to announce, the Haynes-Apperson Co., the George N. Pierce Co., the Pope Mfg. Co., the White Sewing Machine Co. and one other.

Unless they themselves pay the price of the more precious metals, however, the exhibitors who received gold and silver awards will receive bronze medals, bearing, respectively, the stamps "Gold" or "Silver," as the case may be.

This measure is taken because the exposition is under heavy expense, and it is necessary to practise economy. Bids for the manufacture of these counterfeit gold and silver medals have been called for, the managers of the exposition having reached the ingenious decision that it is not the material out of which the medals awarded the exhibitors are made that indicates their value, but the stamp of the exposition company.

Acme Will Make Three Models.

For the 1905 season the Acme Motor Car Co., of Reading, Pa., will place on the market three models—one, two and four cylinder cars, respectively. All except the first mentioned will have pressed steel frames and mechanically operated valves.

F. E. Moskovics, the new sales manager of the company, expects to handle the business from New York, or at least to establish an office here. It is probable also that a branch will be opened in Chicago.

FRANK SCOTT'S EASIEST SALE

How it Brought Husband and Wife Together and Gave the Dealer a Pang.

Frank Scott, proprietor of the Special Motor Vehicle Co., Cincinnati, made easy money one day last week, and lost it as easily. He was preparing to go to lunch, when a cab drew up in front of his store and a well dressed man jumped out. He wanted an automobile, and wanted it quickly. Scott showed him a number of new cars, but none appealed to him. The price of each was too high. When, however, the visitor was shown a second hand Long Distance car at $450 he jumped at the "bargain." The fact that the car was only about four years old did not affect the purchaser's judgment. Asked if he desired a demonstration, he declined it. Scott looked at the man in amazement, and when he pulled out a roll of yellow backed five-hundred-dollar-bills he looked at him again.

While he is a good salesman, Scott is not accustomed to making sales quite so easily. When the man peeled off a "yellow back" from his roll Scott discovered that he had no change for the amount. In fact, so easy had the sale been made that he was afraid of the money anyway. Accordingly he went with the stranger to the bank, which promptly exchanged the big bill for smaller ones. Scott's suspicions took wings and he took his $450 and gave the stranger a receipt.

The new owner of the car then asked the loan of a man to drive him to Cynthiana, Ky. Scott was only too willing to oblige. He even delegated his brother Tom to perform the pleasure. Before they had fairly started the stranger asked that the car be stopped at the Grand Hotel in order that he might obtain his grip. The driver was obliging of course, and did as requested. The man disappeared in the hotel, and Tom Scott waited and waited. In fact, he waited until he was weary—very weary. Then he went indoors to look for his customer. He was nowhere to be found. When Scott returned to the car, however a lady was awaiting him. She stated that the new owner of the car was her husband, her long lost, long chased husband. She had followed him from Cincinnati to New Orleans, from New Orleans to St. Louis and from St. Louis back to Cincinnati. She was not the only one looking for the man. The police were after him also; not that he was a crook—he was merely crazy.

Scott gave back the $450 and returned to the garage a sadder but a wiser man.

Decatur Dealers Spread Out.

Johnson & Landis, Decatur, Ill., are erecting a building, 114x43 feet, to be used as a salesroom and garage. It will be equipped with all modern improvements, including a repair shop, charging station, and will be ready for occupancy in a few weeks.

The Week's Incorporations.

Camden, N. J.—The Kensington Automobile Co., under New Jersey laws, with $100,000 capital. Incorporators: V. W. Sipes, D. G. Cameron, E. C. Huselton and H. A. Tucker.

Portland, Me.—Kendall Leather Tire Co., under Maine laws, with $500,000 capital. Officers: President, W. G. Kendall, Procidence, R. I.; treasurer, F. P. Larrabee, Portland, Me.

Framingham, Mass.—American Roller Bearing Co., under Massachusetts laws, with $325,000 capital. Officers: President, William B. Lambert, Boston; treasurer and clerk, Frederick B. Hill, South Framingham.

Detroit, Mich.—Pungs-Finch Automobile and Gas Engine Co., under Michigan laws, with $200,000 capital stock. Incorporators: William A. Pungs, Edward B. Finch, Ida M. P. Finch and Dwight C. Rexford.

Where Business Will Blossom.

"Unless I miss my guess," said a man recently retired from the St. Louis Exposition, "the South and West will prove happy hunting grounds for the automobile trade next season, particularly that portion of the trade producing the moderate priced cars. The attendance at the exposition has picked up amazingly, and large crowds are now the rule each day. The overwhelming majority of these people come from the South and West, and the interest they display in the automobile exhibits is encouragingly astonishing—it is real interest, and the kind that promises to result in sales next season if properly followed up. How do I know they were from the South and West? Pshaw! You could tell them the moment they opened their mouths. The Easterner always pronounced it as it is spelled, St. Louis. The folks from the South and West always give themselves away by calling it 'St. Louie.'"

Pope New Building Assuming Shape.

Work on the new Pope building at Broadway and Fifty-fourth street, this city, has progressed far enough to make it plain that it will be a handsome as well as substantial edifice. The foundation is complete and the structural work now extends above the second floor. The brickwork is also well advanced. It is light in color, and its contrast to the big plate glass windows will be very striking. It is thought that the buildin be ready for occupancy by the end of this winter.

Gets More Room to Make Bodies.

Owing to the substantial increase in the demand for their aluminum bodies, fenders and tops, the Springfield (Mass.) Metal Body Co. are this week removing to a larger plant which will enable them to better care for the business. The new factory is located in that portion of Springfield known as Brightwood, five minutes by trolley from the railroad depot.

DISAGREED OVER DEWEY PATENT

And Now the Former Partners are Asking the Court to Settle the Squabble.

An echo of ancient automobile history was heard last wek at Providence, R. I., when, in the Appellate Division, there was a hearing of arguments on the bill, answer and proof in the case of Daniel McNiven against Julian A. Chase and another. The bill asks for an accounting from the respondent, Chase.

McNiven, Chase and Mossberg organized in 1899 the United States Automobile Co., to manufacture automobiles. Certain patent rights known as the Dewey patents had been acquired, under which the corporation was to carry on business. These patents were to be paid for in four installments of $2,500 each. The complainant claims that he actually paid $5,000 of the $10,000 required for the patent rights, the excess of $1,666.67 being paid for the respondent, Chase, as a loan to him, Chase at that time being short of funds.

The respondent, Chase, however, seeks to evade paying anything to McNiven, alleging that after the organization of the company McNiven agreed with the two respondents that he would undertake to sell enough of the stock issued to meet the payments on the patent rights as they became due, and in case of his failure to do so, would personally pay the whole of the $10,000 himself.

Who's Tempting Penn Yan?

The Penn Yan (N. Y.) Board of Trade has received a proposition from an automobile manufacturing company, the name of which is not given, which wishes to enlarge its plant or move, looking to its removal to that village. A meeting of the board was recently held, but the representative of the concern failed to appear, and a committee was appointed to visit the firm's present location and report at the next meeting of the Board of Trade.

Pope to Build a Racer.

The splendid showing of the 2[illegible] horsepower Pope-Toledo in the Vanderbilt Cup race has had its effect on the powers that be of the Pope Mfg. Co. The immediate result will be a six cylinder 90 horsepower car, which will make its appearance at the Ormond Beach carnival in January. Vice-President Albert L. Pope states that it is being constructed with a view to obtaining the mile record of 39 seconds.

Chains Free of Duty.

The Australian customs authorities have given a decision to the effect "that motor car chains not accompanying motors" are to be classified as "chains n. e. l." and admitted free of import duty.

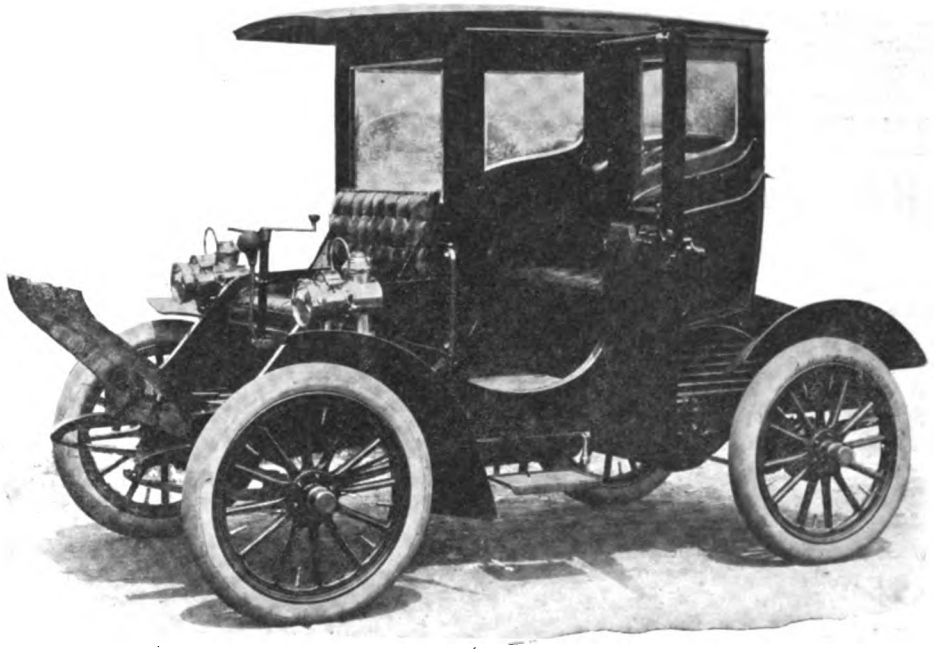
RADICAL DEPARTURES

New Car That Bristles With Striking Innovations—Has Revolving Cylinders and is Controlled by Variable Compression.

In very many respects, quite the most interesting and featureful, if not actually sensational, automobile that has been devised during recent years, is announced as ready for marketing by the Adams Co., Dubuque, Iowa, whose simple, yet ingenious, gradometer has closely identified them with the trade.

The Adams-Farwell car, as it will be styled, employs not merely a radical departure in motors, but in nearly every other essential part incorporates originality of such high order that it cannot well fail to command almost universal attention. It is to be added that the car was not presented to the public until long and exhaustive experiment, extending over several years, had convinced its sponsors that radical though it may appear in many details, it is outside the realm of doubt or questionable merit. The extent of their efforts to assure themselves on this point may be measured by the fact that the perfected car, as here illustrated, represents the concentrated experience with four previous models, the first of which was made up as early as 1898.



The body is what they call a convertible brougham; convertible in that it will comfortably accommodate seven passengers, and yet it may be used as a single seated car and present the elegant appearance and have the luxurious riding qualities of the brougham. To accomplish this it was necessary to provide motor power and running gear of strength sufficient for a seven passenger car, to arrange means which would enable the car being operated from the enclosed part when occupied by three or less, or operated from the front seat when more passengers are accommodated, and to provide variable strength springs, making it safe for a full load and yet pleasant riding for a single occupant.

The car, in either form, has an appropriate appearance—not a runabout, with a temporary seat to it, nor a carryall looking for passengers.

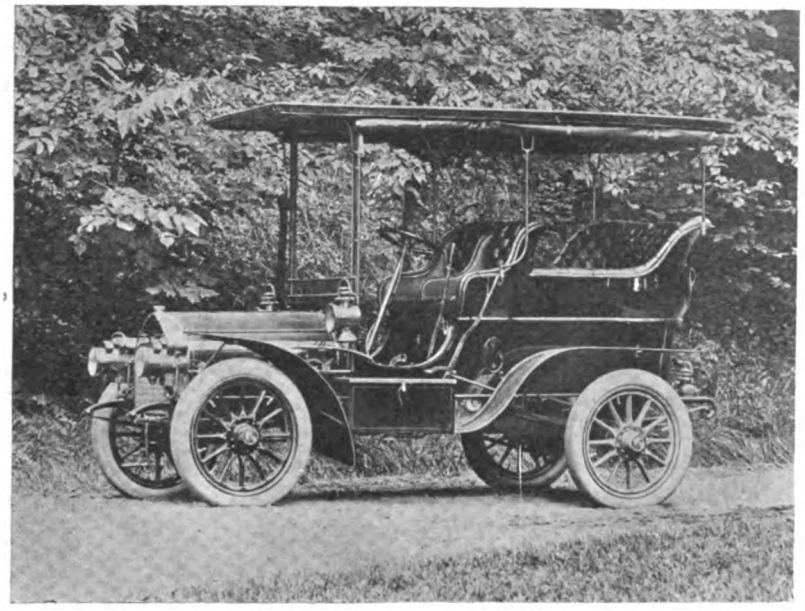
In pleasant weather the plate glass windows in front, doors, sides of seat and in the back may be dropped, making the vehicle virtually an open one. The pillars supporting the solid top, while rigid, are comparatively small, not obstructing the view or air circulation. At the same time a curtain may be instantly drawn down to exclude wind, dust or sun, or a sash drawn up to exclude cold or rain. When entirely enclosed with all windows in position the occupants have an unobstructed view.

The furnishings and general appointments of the car are very complete. The seats, sides and backs are richly trimmed in dark green, hand buffed leather of the finest quality. Curled hair and springs make the seat upholstery most comfortable. Speaking tube, curtains, hooks for coats and wraps, lamps, horn, tools, etc., are furnished. In the front seat there is a free space for storage, 31 inches wide, 24 inches deep and 11½ inches high. By removing the front cushion additional space can be used, and by opening up the front a small trunk or other baggage can be transported.

The remarkably easy riding qualities of the car are attributable to two essential features. First, the passenger seats are between the axles, not overhanging the rear axle. The vibration communicated to the passengers is claimed to be much less than that communicated to the axle, and the springs have less to overcome than have the springs on a vehicle with a seat overhanging the rear axle. The wear and tear on the rear tires is much less than with overhanging rear seat. Second, it is impossible to construct a car or a carriage with the ordinary springs and have it ride equally comfortably and safely with a passenger load of 150 pounds and with a load of 900 pounds. If the springs are strong enough for the heavy load they are too stiff for the light load, and, therefore, uncomfortable riding.

ADAMS-FARWELL CONVERTIBLE CAR.

The Adams-Farwell people, therefore, equip their cars with their patent variable strength springs. This consists of an auxiliary leaf with means for clamping this leaf to the main spring. When more than two occupy the compartment the rear auxiliary springs are clamped to the main spring. When the front seat is occupied the front spring is clamped. The operation of loosening or clamping these auxiliary springs requires but a moment's time. Both front and rear springs being the same length and width, 40 inches by 2 inches, one extra spring carried on a tour would replace any spring, should one be broken by accident.



The car may be operated from the rear seat of the enclosed compartment or from the folding front seat. This system is patented, and is considered of the utmost importance in a car of this character. The change from one seat to the other of the controlling column and treadle requires less than a minute's time. In the control of the car there is employed a steering lever, one clutch lever, which also locks the brake; one foot treadle, to vary the speed of the engine, and a foot pedal to apply the hub brake—four in all, about half the number of controlling appliances found on many high powered cars. The proper direction of movement of these levers and treadles is that which one would do most naturally. The clutch lever, when in position straight back, locks the hub brake; a movement forward to the right releases the brake and engages the low forward gear; the car moves forward gently. A further movement forward releases the low and engages the high gear, the car moving faster. A backward movement of the lever releases the high and engages the low gear, the car slacking speed. A further movement backward releases the low, and a still further movement engages the backing gear, which may also be used as a brake. There is a position between the brake and backing where the spark is shut off and the engine stopped. Changing from low to high gear when ascending a hill can be done smoothly.

The speed of the motor is controlled entirely by a foot treadle, which regulates the variable compression control system. Spark and carburetter are automatic. A pressure of the toe increases the speed of the engine; a pressure of the heel decreases the speed.

An internal, expanding, double acting brake on the rear hub is engaged by pushing a pedal forward. If this brake is engaged when the clutch lever is straight back the brake

Providing the "Full Line."

Each year makers find it necessary to give more attention to the task of providing their agents with a "full line" of cars. The time when one model could be produced and made to constitute the dealer's stock in trade has passed, never to return. It is even admitted now in many quarters that it is a good thing even from the maker's viewpoint to widen lines. By so doing it becomes possible to obtain the entire trade of customers, and not see them patronize other makers for anything different from the standard model produced by the maker in question.

In the large cities it was, until recently, no unusual practice for a dealer to content himself with representing a single maker, whose product was usually confined to one type of car. Such a policy, however, was never adopted by the dealer in the smaller cities and towns. They had to stock a more representative line in order to appeal to the largest possible number of buyers, as thereby the loss of many sales was avoided. It was the difference between keeping an automobile store where all kinds of cars could be procured and of establishing a depot for the sale of a particular car.

At the present time it is only at branch stores that the latter plan is still followed. The country dealer is no longer alone in carrying a diversified line. Even in the largest cities cars that do not directly conflict with the "leader" are stocked and pushed. Where the relations of the dealer with the maker are peculiarly close and intimate, and where the maker's line is unusually complete, an exception is sometimes made, but such cases are rare.

It has thus come to be realized that makers must either extend their lines or stand by and see dealers enter into relations with rival makers. As the latter course is naturally distasteful, the former is adopted wherever possible. Few lines can now be regarded as complete unless they include runabouts and touring cars, as well as single and multiple cylinder engined cars. On his part, the dealer is only too glad to have this policy of expansion followed by the maker. It is much more satisfactory to confine, as far as possible, one's dealings to a single concern. Bookkeeping is simplified, ordering is easier, complaints are more easily handled, replacements are better understood, and, last, but not least, only one credit system has to be established and maintained. Furthermore, the goods are more likely to be uniform, and the matter of guaranty is a more simple one that it would be if its interpretation were intrusted to two or more firms.

It remains to be seen, therefore, whether the policy of "one dealer, one line," can be made a success. The answer will in many cases depend to a very great extent on how diversified and comprehensive the line is. Dealers must consult their own interests chiefly in this as in other matters, and sentimental considerations will have little weight.

Lacking in Luxuriousness.

While the improvement and refinement of the mechanical details of the American cars were beyond dispute, a close and competent observer who had abundant opportunity to actually try a number of those exhibited at St. Louis, writes the Motor World that, contrasted with the French cars, the upholstery of the American productions was markedly inferior.

"The luxuriousness of the French cars, the sense of softness and at the same time firmness, with the entire lack of evidence that there are any springs in the cushions in the whole thing is very surprising," he added. "It does not seem either that the upholstery is so very much thicker than some of the best American machines; but, whatever be the cause, it certainly does hold one up better.

"Some of the best American machines, when tried on a rough road, proved to be too thin in the back seat. In one case in particular a hard jounce caused such a hard contact between springs and wooden bottom of the seat that there seemed to be hardly any upholstery there at all. It is just as though too much were trusted to the springs, and when the springs went down there was little or nothing between the body and the boards."

It is undoubtedly a fact that the French will pay more for this kind of luxury than the ordinary American purchaser, but, at the same time, it is equally true that he gets what he pays for—luxurious cushions.

Some purchasers of our American machines are willing to pay for luxury, too, and would do so if they really got it.

Part explanation for the situation may be in the fact that the chassis and body of a French car are usually made in two places, and the man pays for the body and has it made just as luxurious as he has money to make it. The upholsterer or body builder makes each body to suit the individual purchaser. This is seldom done here, where one stock body is built like another as near as it is possible to make it.

Repairs and the Charges Therefor.

The repair departments of most of our factories have not proven to be what they ought to be, from the standpoint of the owner of an automobile.

Work coming from them has been found to be badly done, expensive and altogether unsatisfactory. The charges made for parts applied and overhauling are out of all reason, as compared with the cost of the machine.

A simple mud guard brace purchased, and perhaps weighing a pound or two, costs a dollar or more. It is merely a bent piece of iron with a few holes in it. It is something that the owner himself can attach, but he has to pay a price beyond anything else outside of jewelry.

In the first place, if this mud guard brace had been well designed and well attached to the machine it would not have vibrated to

Digitized by Google

such an extent as to drop off, which actually happened. So, really, the whole thing was the fault of the maker, and his encouragement to the purchaser and owner of an automobile was to charge him unmercifully for the repair.

This practice is the last that should be adopted by the manufacturer. The whole industry is still in an experimental stage. There are many things that break and go wrong about the automobile that are the fault of the maker. For this reason it should be made as easy as possible at this stage of the game for purchasers to have repairs made.

As it is, the one who has been unfortunate enough to have his machine in the shop for repairs tells his neighbor, a possible buyer, of what an awful repair bill he had. This discourages the neighbor from buying.

On the other hand, if the repair had been made at the lowest possible cost the buyer would have said so, and would have stated that the repair did not amount to much after all; the delay was the worst thing.

There is a very good reason for this. Good repair mechanics are hard to find. The ones that are really good mechanics in the automobile business find work in better places in the shop. The consequence is the "left-overs" find their way into the repair job. They waste time and material. They spend three or four hours looking for trouble that perhaps one hour will fix. They do not understand the machines. They cannot diagnose the trouble quickly.

This applies to the manufacturers' repair department; but it applies ten times more to the repair department of the ordinary garage.

The root of the evil is, after all, the fact that good men are scarce. The quicker the manufacturers take hold of this matter and spend a little money teaching good, common sense mechanics repair work the quicker will this sort of complaint cease.

The bicycle industry went through the same period, and when a machine was taken into a repair shop there was no certainty that it would come out all right. After a while mechanics that could do this work well became numerous. The automobile is a hundred times more complicated than the bicycle. It is going to take a higher grade mechanic to fill the bill. While there are new machines coming out almost every month in the year, and changing at least once a season, it is not to be expected that every repair man can learn every make and every model of it. It is a big proposition, and it will be no easy task to make things go smoothly. All the more reason for the manufacturer giving this some attention.

Seasons and Sales.

Despite the efforts made to eliminate "seasons" in the automobile industry, and to make it plain that the motor car is an all season as well as an all weather vehicle, it remains true that sales are almost entirely dependent on the weather. Most people buy cars only when they can use them. If it rains or snows they defer their purchases. If the sun shines brightly and unexpectedly they buy. No weathercock could be more influenced by the winds than they are by the weather.

With the passing of summer, eyes begin to turn toward the new models. A check is placed on trade, and a considerable number of sales are delayed, in spite of the fact that splendid touring weather is still to come, because buyers are disinclined to purchase old models when the new ones are almost ready to appear. If the latter are ready for delivery before the winter sets in some sales for immediate delivery are made; but, as not many are shipped before the first of the year, sales of this kind do not cut very much figure. With the coming of January and the shows all thought of the old models is dropped, and it then becomes a question of weather and deliveries what amount of actual business shall be done.

The winter of 1902-'03 was an open one, and dealers even to-day sigh regretfully when they contrast its record of sales with that made in the doleful winter of 1903-'04—the severest known for many years and the dullest in automobile history. If winters, like dreams, go by contraries, as many people say they do, the approaching one should be a record breaker, both in the way of openness and of sales producing character. Should it so turn out, those dealers who are, or soon will be, able to make deliveries of new goods will reap a harvest, and some of them are already felicitating themselves upon the prospect.

Generally speaking, the selling season extends from January until August. After the latter month—and sometimes after the Fourth of July—there is comparatively little done. This year, for example, August was a bad month, September a fair one and October considerably above the average, as a result of the fine weather that prevailed in many places. Little is expected of November, and still less of December, unless these months should also be marked by exceptionally fine weather. But with the beginning of the year a turn for the better is looked for, especially after the Madison Square Garden show and during February, when the season is expected to be in full swing.

For six months of the year, therefore, viz., from the beginning of October until the end of March, the weather plays the most important part in the making or marring of sales. If the elements are inclement during October, November and December sales drop away to almost nothing, some of them being entirely lost and others postponed until spring. It is not quite so bad after the first of the year. Then, even if the winter is severe, orders are booked and it is merely the deliveries that are delayed. Still, even that is quite a serious matter, for a sale is never really made until the car is actually delivered. Besides, few dealers have either the space to store or the credit to purchase and carry a large stock of cars against an uncertain delivery date. Deposits help some, both in binding the bargain and in relieving the financial strain. But there are few dealers who will not welcome an open winter and acknowledge that it gives the fillip to their business that is so badly needed at that time.

There is one meritorious object of pity who is seldom vouchsafed the manifestation of it. We refer to the demonstrator of a car, who, in his efforts to satisfy a prospective purchaser that his car is no slow coach, falls into the clutches of the law and has a sale almost made untimely nipped in the bud. Truly he has to carry water on both shoulders. If he observes the decorous speed of eight miles per he leaves his passenger uninspired and unfascinated; the expected and desired touch of "ginger" is lacking, and the professed law abiding citizen is disappointed at not being called upon to abet an infraction, even although only a tiny one, of the statute. If on the other hand he drives not wisely but too well, and is brought to book by a ready cop, he is in as bad if not worse plight. How will the passenger take it? Will he regard it as a joke, compensated for by the thought of a gloriously exhilarating ride? Or will he conclude that motoring is too sporty a game just at present and decide to wait until the "dark ages of automobile legislation are a thing of the past? The point of view means a sale made or marred, and the demonstrator can only wait until he sees which it is.

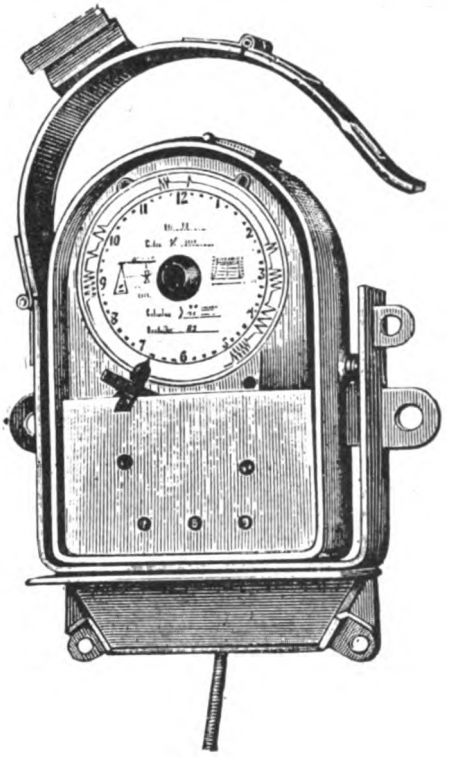
VELOGRAPH IS ALMOST HUMAN

Marvellous Instrument That Enables an Owner to Account for Every Movement of His Car.

In a wonderful little instrument measuring only a few cubic inches and weighing but a few pounds, imported into this country from Germany and now being exhaustively tested, is contained a combination of movements that motorists have hitherto sought in vain. If the claims made on its behalf are born ouet—and there seems no reason to doubt it—the device will prove a boon not only to motorists but to owners of wheeled vehicles of every class.

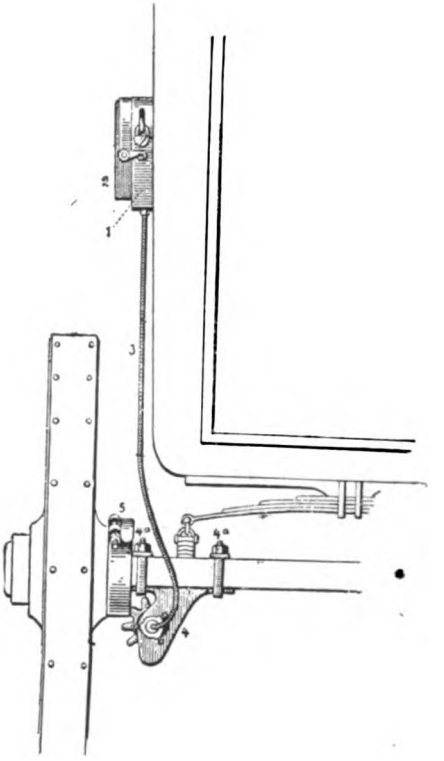


The device is styled the Velograph, and is being placed on the American market by Charles E. Miller, 97 Reade street, New York. It is an odometer, a speed indicator

and a clock, all in one. The record of speed is minute in detail and is kept in a permanent form, on disks, so that it can be filed away for reference at any future time. These disks record not only every movement of the car, but every stoppage, and tell how long the stoppage lasts, no matter how many there may be. In short, the disk contains a complete history of the car's movements for each twelve hours—its starts and stops and its rate of speed for every mile travelled.

The immense value of such an instrument is self-apparent. It checks, almost eradicates, the chauffeur evil, as that individual cannot deviate from the straight and narrow path of rectitude without leaving on the disk a record of his wrongdoing. An infallible and indisputable record of speed at all times is kept and would undoubtedly stand the closest scrutiny in a court of law. Before its mute testimony the evidence of "tin" stop watches and of b'gosh constables would fall to the ground. On the other hand, the chronic scorcher, who delights in forty and fifty mile an hour flights of speed, would do well to beware of the Velograph, for it would bear damning evidence against him.

The Velograph consists of clockwork in a wrought iron casing, a clamping frame, a flexible transmitter, a pinion with bracket, two clamps, a hub ring with spiral and 100 recording disks. The casing is affixed by screws to the dashboard or other suitable or convenient part of the car, and the clockwork placed in it, as shown. The hub ring with spiral—which is made in various sizes—is then attached to the near side front wheel hub, and the pinion and bracket is fastened by means of the two clamps to the front axle, in such a way that the pinion en-



gages the spiral of the hub ring. The flexible transmitter is then drawn downward through the center hole in the clamping frame and attached, without too much slack, to the pinion. A loose sleeve is fixed in the side of the pinion bracket; this is removed and the transmitter drawn through it and fastened by a pin. The sleeve is then replaced and the device is ready for operation.

It will be seen that the disks are divided off into hours, exactly as are clock faces. The subdivisions, however, are different, being arranged according to the quarter hours. A pointer—seen near the bottom of the disk—connected with the transmitter and actuated by it, bears against the disk at all times; as the latter is continually revolving, the pointer makes a record even when the car is motionless, the record being circular in form. When the car starts up the pointer is actuated through the pinion and transmitter, so that it makes a zig-zag mark. If the speed is slow the marks have a considerable angle, while as the speed increases the angle is decreased until the lines become almost straight. At the completion of every mile the pointer springs back to its starting point on the outer periphery of the disk.. As the disk is subdivided into hours and minutes, corresponding exactly to a clock dial, it is easy to read off the time taken to cover a given distance, together with the stoppages. As long as the car is at a standstill the pointer traces a circular line, whose length shows the duration of the stoppage.

Any irregularity in the day's work, such as driving too fast or too slow, or prolonged stoppages, is immediately apparent. The inner part of the disk can be used for remarks, such as the number of the van, date, etc. The total mileage travelled can be checked by noting the mileage shown on the automatic counter at starting and on returning.

To a Motor World man Charles E. Miller stated that much interest was being shown in the Velograph. Several of the big depart-

ment stores are now testing them on horse-drawn as well as motor, vehicles, having had hub rings made especially for the purpose. The device has been used in Germany for some time, and has proved entirely practical.

The Inventor of the Differential.

Comparatively few motorists know that the differential, or balance gear, without which no gasolene or steam automobile could be built, was invented by James Starley, a famous English cycle maker. The tricycle was originally built without means of varying the speed of the two rear (driven) wheels, and in that form was a very imperfect vehicle. Starley applied himself to the task of inventing a device that would permit one wheel to travel faster than the other—as in turning corners. In some form or other a compensating device is used on practically every automobile built, with the exception of electrics using two or more motors.

NO LONGER A MYSTERY

Cause of the Horseless Bray at Last Made Plain and Real Sport Clearly Indicated.

It is now small wonder that the Horseless Age shuddered and exclaimed "Fudge!" at the very thought of the race for the Vanderbilt race. It is of even less wonder that its absent view of the race led it to describe the actual competition a "barbarous exhibition," and to style "idlers" and "gamblers" the thousands of poor, deluded, ice watery individuals who witnessed the "barbarity" of "no earthly use" to any one.

While the miserable "idlers" and "gamblers" were indulging their "morbid cravings" to the full, what was the Horseless Age doing? Working tooth and nail for the promotion of genuine sport! Working like a slave that the walls of a town hall might look pretty—working that the eyes of womankind might rest upon pictorial presentments of vehicles of the same splendor which engaged in the barbarous performance on Long Island—working that the ladies, while thumbing the same cards with which detestable gamblers ply their trade, might be inspired by the spirit of gasolene. Ah! it was a work for men—was that in which the Horseless Age engaged. It was a work to wring cries of "Fudge!" from any man with real red blood in his veins and real wind-kissed whiskers on his face. Most of those in the trade—the same "idlers" and "gamblers" who viewed the barbarous race—know the magnitude of the task; for did they not receive communications informing them of its extent and helpfulness. The communication was not copyrighted. It is therefore possible to print it in its own glowing terms. Read it, every one of you, and, having read, reflect. This is it:

> Gentlemen: I have been requested by the ladies of the suburb where I reside to endeavor to procure some automobile posters for an automobile euchre entertainment which is to be held in the town hall in the near future. Quite a number of machines are already owned there, and possible purchasers are numerous. Posters will be put up conspicuously, and will, no doubt, to some extent help the cause. If you have any advertising matter of this character on hand I should be pleased to receive it for this purpose, as also any small cards or leaflets illustrating any single model of your manufacture. For the latter cardboard is preferred.
>
> Sincerely,
>
> THE HORSELESS AGE.

It will be noted that there are "I's" even in a Horseless Age.

Up to the middle of this month there were 320 automobiles registered in Milwaukee, Wis.

Club and Christians Will Study.

There is every prospect that an arrangement will be made whereby the Springfield (Mass.) Automobile Club and the Y. M. C. A. of that city will join in giving a class in automobile instruction this winter. Meetings have been held and committees appointed with this object in view.

As was told last week, the club has already made arrangements for a series of meetings, with lectures and demonstrations at the various factories and garages. In this undertaking the educational branch of the Y. M. C. A. will probably co-operate. A meeting of the latter was held last week, at which the plan of organizing such a class was discussed and met with much favor. A committee was appointed to look into the details of the plan and report later to the committee.

St. Louis Also Forming a Class.

St. Louis, Mo., is the latest addition to the cities which will conduct automobile instruction classes this winter. As is the case in a number of other places, the Y. M. C. A. is the initiating body.

In connection with the Ralph Sellew Institute, the association will give a thorough course of lectures on the care and running of automobiles. A course of ten lectures has been arranged.

G. P. Dorris, of St. Louis, will deliver the opening lecture on gasolene motors, and will be followed by three lectures on steam motors, by W. W. Leathers, and three lectures on electric motors by C. C. Clark, during the months of October and November, when other lecturers will take the stand.

Springfield's New Slate.

An entirely new set of officers was elected by the Springfield (Mass.) Automobile Club at its annual meeting last week. They are as follows: President, L. J. Powers, jr.; vice-presidents, Mark Aitken, Dr. George H. Finch, Dr. J. W. Hannum and Willis Anderson; secretary, Dr. George Fenn; treasurer, W. L. Bunker; directors, Dr. V. J. Irwin, A. B. Chase, Harry Daniel, Dr. F. E. Hopkins, A. A. Geisel, William Baush and Frank Bocorselski.

Princetonians Elect Frick President.

The Automobile Club of Princeton University held its annual election of officers last week, with the following result: President, Childs Frick, Pittsburg; vice-president, S. H. Bird, New York City; treasurer, J. S. Martin, Belleville, N. J. The club has a membership of thirty, and may hold some speed trials in November.

Gold Watch For Lyttle.

As a token of his appreciation of Herbert H. Lyttle's splendid performance in the Vanderbilt Cup race with a 24 horsepower Pope-Toledo, Colonel Albert A. Pope has presented the skilful driver with a handsome gold stop watch and chain.

DECLARED LAW OPPRESSIVE

Illinois Judge Shocks His Rural Neighbors by Nullifying a Ridiculous Speed Limit.

Dixon (Ill.) motorists will ask the council to pass a new ordinance in place of the six miles an hour one which Judge Heard recently declared invalid. In place of the six miles clause, they want automobiles limited to a "reasonable rate" of speed.

Some members of the council, on the other hand, want Judge Heard's decision appealed from and the case carried to the Court of Appeals. It is believed that such action will be taken.

The obnoxious ordinance was passed several months ago, and, in order to test its legality, Egbert R. Kent so arranged matters that he was arrested on the charge of violating the regulation and was given a trial before a police court. He pleaded guilty to the charge and was fined $20. He appealed the case to the Lee County Circuit Court, with the result of securing a reversal of the sentence. Judge Heard, in handing down his decision, says:

"The ordinance limiting the rate of speed of automobiles to six miles an hour is unreasonable and void because the speed limit is too slow. Said ordinance is void because it is oppressive; said ordinance unduly discriminates against automobiles and is void; said ordinance is void because while in some business portions of the city of Dixon the rate of speed might be limited to six or eight miles an hour and be reasonable, yet in other portions of the city the speed limit of six miles an hour is unreasonable, oppressive and tends to create a monopoly in favor of means of travel not included in the ordinance or expressly excepted from its operation."

Two States in One Club.

The annual meeting of the Missouri and Kansas Automobile Club was held at Leavenworth, Kan., on October 15 with an attendance of fifty members. Committees were appointed to prepare road maps of Kansas and Missouri and to work with the farmers of the two States in an effort to secure good roads. Some of those present made the trip from Kansas City, Topeka and Atchison in their machines. Next year's meeting will be held at Kansas City. The following officers were elected: President, Omar Abernathy, Leavenworth; vice-president, H. H. Strait, Kansas City; secretary, Edward Osborne, Topeka; treasurer, Dr. Beitzel, Atchison.

New Britain Motorists Organize.

Motorists of New Britain, Conn., met last week and organized a club, to be known as the New Britain Automobile Club. These officers were elected: President, Philip Corbin; vice-presidents, Howard S. Hart, George S. Landers; secretary, W. L. Hatch; treasurer, H. S. Damon.

FARSON FIGHTS ON

Chicagoan and Two Kindred Spirits Refuse to Surrender and Spring a Midnight Injunction.

Just when everything seemed to be lovely and the goose was honking at its highest possible elevation, the Chicago automobile ordinance imbroglio took on a new and startling phase. As a result the situation is again mixed and things are at sixes and sevens.

As related in last week's Motor World, the backbone of opposition to the numbering and licensing provision appeared to have been broken. The members of the Chicago Automobile Club were rejoicing over their ignominious and utter defeat; President Farson had gone to St. Louis in disgust, and Frank X. Mudd—what's in a name?—and one lone companion were left standing on the burning deck and proclaiming that they never, never would give up the ship. The city officials were ready to begin their crusade against unregistered and unnumbered motorists, and a day was set to make wholesale arrests.

Suddenly, like a bolt from the blue, came a counter stroke, planed and set in operation by the never-say-die Farson. That arch plotter came back from St. Louis, and, with his lawyers, sought out Judge Hanecy, explained that the three park boards were about to make wholesale arrests, and at 11 o'clock at night secured from him an injunction against these organizations and their police restraining them from interfering with President John Farson of the Automobile Club, Frank X. Mudd or Thomas J. Hyman. These three automobile owners were the petitioners, but it is understood the writ will apply to all chauffeurs who wish to run their machines without a city number tag.

The "coup" of President Farson and his two associates was a complete surprise to the city and park officials, who were looking forward with much pleasure to the raids planned.

Late in the night Attorneys Chester M. Masslich and Charles F. Davies went to Judge Hanecy's residence and laid the case before him. The park officials, they stated, were preparing to arrest all automobile drivers who ventured on the boulevards ungraced by a large tin sign issued by the city authorities. They thought this was all wrong.

So did Judge Hanecy, and forthwith he granted the injunction prayed for by Masslich and Davies. The writ was issued without notice, and will last until such time as the attorneys for the park boards can convince Judge Hanecy it is unjust. As Mr. Farson's lawyers said at midnight, "It is up to the other fellows now."

On Sunday the police made wholesale raids on untagged cars, capturing more than forty-four in all. They were careful to respect Judge Hanecy's injunction, however, and Messrs. Farson, Mudd and Hyman were let severely alone.

Will Finally Test Ferry Law.

The Automobile Club of America has taken steps to test the obnoxious ferry law which prohibits passenger boats from carrying automobiles in which the fires have not been extinguished. At the instigation of the A. C. A., Assistant United States District Attorney Baldwin will begin suit against the Brooklyn Ferry Co. for violating the law, which carries a penalty of $500 for each violation. Mr. Baldwin has the papers, but will not be able to begin work on the case until next week owing to press of other business. The suit will be entered in the name of Collector Stranahan of the Port of New York.

Last August Jefferson Seligman and William W. Niles, attorney for the club, went to Washington to see Secretary Metcalf of the Department of Commerce and Labor in regard to securing a more liberal interpretation of the law. Their efforts were without success, as they were told that Congress would have to pass another law or amend the present one before there would be any relief. It is the interpretation rather than the existing law itself which has made so much trouble for automobile owners and drivers since the Slocum disaster frightened the government officials out of their wits.

It is the contention of the club's legal adviser that the present law is not broken when a gasolene automobile, with the engine running, is carried on a ferry. The claim is made that an explosive gasolene engine does not contain fire, and for that reason the present law is not a bar to the transportation of cars with the engines running. The matter is to be thoroughly thrashed out by the A. C. A., and if the decision of the first court goes against the club an appeal to a higher court will be taken. In any event, no relief can be expected very soon, as it will be impossible for the case to be tried until December, while January is a more likely time for the trial.

How Road Racing Betters Cars.

An "official" explanation of the poor showing of the Panhard cars in the Bennett Cup trials last summer has made its appearance. All three cars entered for the French eliminatory race in the Ardennes broke down, it will be remembered, after one or two rounds. The Panhards had always done so well in previous races that at first sight the fact that all three machines gave out appeared perplexing. The matter was soon cleared up. The firm had made a mistake in not providing sufficiently large radiators. For short runs the motor kept tolerably cool, but in a race extending over 250 miles, the cooling surface proved inadequate, and the drivers could make no headway. Needless to say, the firm at once took the machines in hand and altered the defective part, with good results.

While of small general interest, the incident serves to show how road racing contributes to the betterment of cars—a fact which euchre-promoting Horseless Ages and others of that ilk seem unable or unwilling to comprehend.

RECORDS THEY MADE

Kiser and Gorndt Secure What They Sought and Considerably Alter the Record Table.

Fuller details of the record breakings of Charles Gorndt and Earl Kiser at Cleveland on Wednesday of last week, bare facts of which were published in last week's Motor World, show that each man annexed not merely the particular record he sought, but a long string of intermediate times.

Gorndt, who attacked the fifty-mile figures, used the Winton Baby Bullet. He tried first and created new times from twenty-one to fifty miles, inclusive. Kiser, in the Winton Bullet No. 2, sought the twenty-five-mile record, and captured it, of course. En route he also wiped out the figures from sixteen to twenty-five miles, which Gorndt had just set up.

The performance of each man is shown by the following tables:

CHARLES GORNDT'S RECORDS.

Mile.	Single mile.	Total.	Mile.	Single mile.	Total.
1	1:00⅝	1:00⅝	26	1:03⅜	29:07½
2	1:00⅝	2:13½	27	1:03⅜	30:11
3	1:07½	3:20⅝	28	1:03⅜	31:14⅜

Tall Track Tale From Muskegon.

From Muskegon, Mich., comes a wonderfully weird tale of a five-mile automobile track which is to be built on a level tract of land there near the stockyards. Dr. J. B. Love is one of a committee said to have been recently appointed by the A. A. A. to fix the location of the course. He says it will be 125 feet wide and circular, and that it can be built at a cost of $1,200 a mile. A large hotel and a grandstand are to be part of the plant. When the track is completed it is to be presented to the A. A. A. upon condition that all of the national and international races be held there.

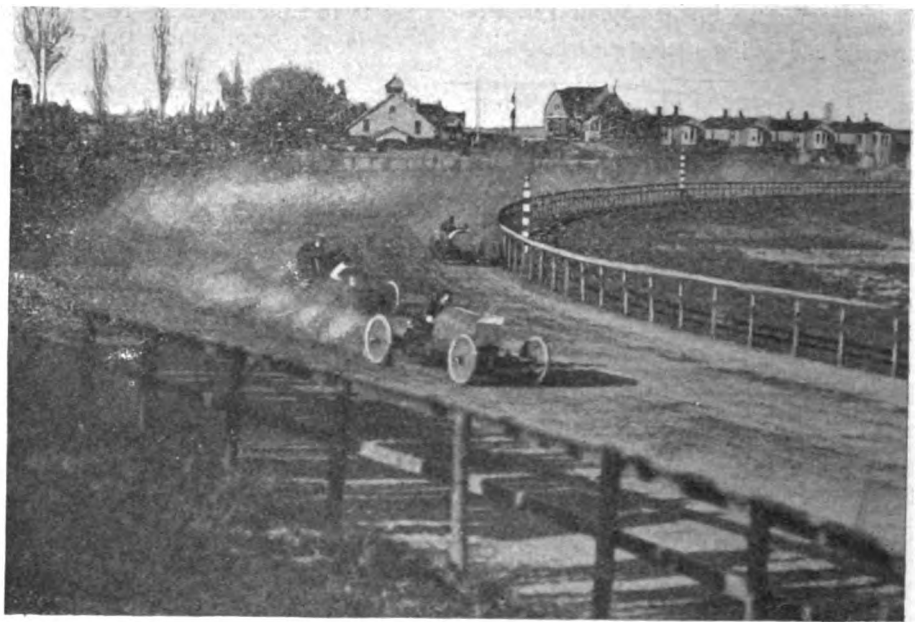
BIGGEST CROWD; POOREST RACING

Oldfield's Funk Helps Spoil Brighton Meet—Bernin Does Good Work—Wridgway's Spill.

Of much more interest than the exhibition of so-called racing at the Brighton Beach (New York) track on Saturday were the immense crowd of spectators and the tremendous aggregation of cars that a mid-fall day glorious in its promise but a trifle boisterous in its fulfilment drew to the track by the sea. A sorely perplexed and considerably frightened horse in the infield attracted much attention and provided the element of mirth that was sadly needed to put the spectators in a good humor.

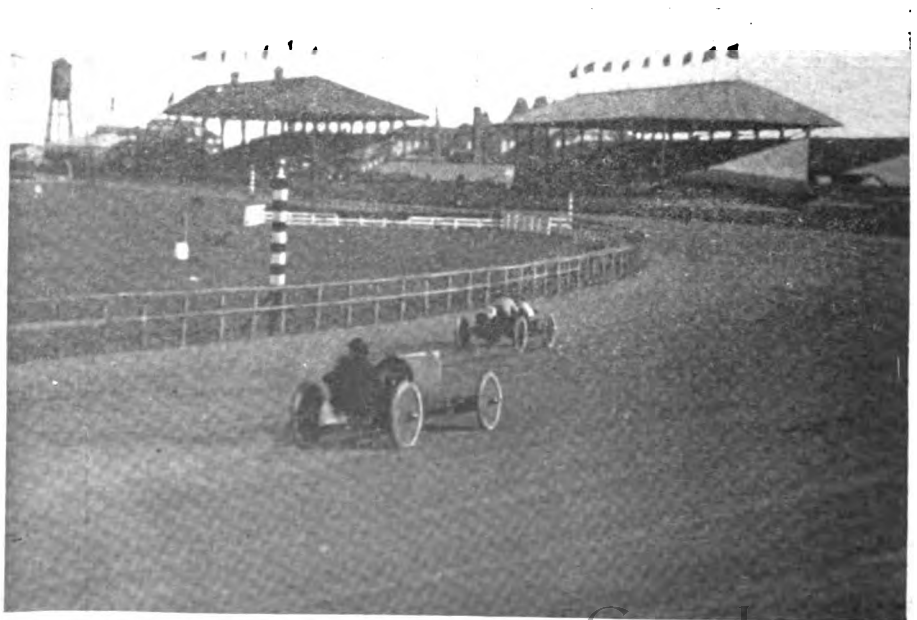
As a race meet the affair is to be put down as an utter failure. Save in the Brighton Handicap, where a really close finish developed, there was no racing. Many previous meets have been marred by runaways, flukes and break downs, but all of them had alleviations or extenuating circumstances. Saturday's meet had nothing of the kind. It was duller than ditch water.

Rarely, even when the big Brighton Handicap is run at this track, has there been a larger or more "classy" gathering than journeyed thither on Saturday to witness automobile racing. The heavy rain of Friday morning had effectually laid the dust and made fine going over the roads leading to Coney Island. There was just a touch of winter in the atmosphere, and the searching wind, which became stronger as the afternoon drew to a close, made heavy and voluminous wraps very acceptable to those who came in cars, and even to many who did not. The gathering of cars even surpassed those at the Empire City track, both in numbers and variety. Parked in the betting ring, on the lawn and in front of the clubhouse, they made an impressive showing. The number almost reached five hundred.



The spectators were conservatively estimated at ten thousand.

The unexpectedly large attendance caused a shortage in both the programme and sandwich supplies. Programmes were unbuyable after 3 o'clock, while around 4 o'clock sandwiches were sold at $1 each.



Thery and Callois, the two French racing men, were spectators, and were not favorably impressed with track racing—which is scarcely surprising in view of the sample on view. E. R. Thomas's new car was there in charge of E. E. Hawley.

The most sensational episode of the day occurred late in the afternoon, just after the finish of the Diamond Cup race. C. G. Wridgway, manager for Banker Bros'. New York branch, in a 24 horsepower Peerless, had finished and had nearly circled the track again when the breaking of his seat, made of perforated sheet metal, nearly threw him out and rendered it impossible for him to guide the car into the straight. The car, after gyrating violently on the track, made a

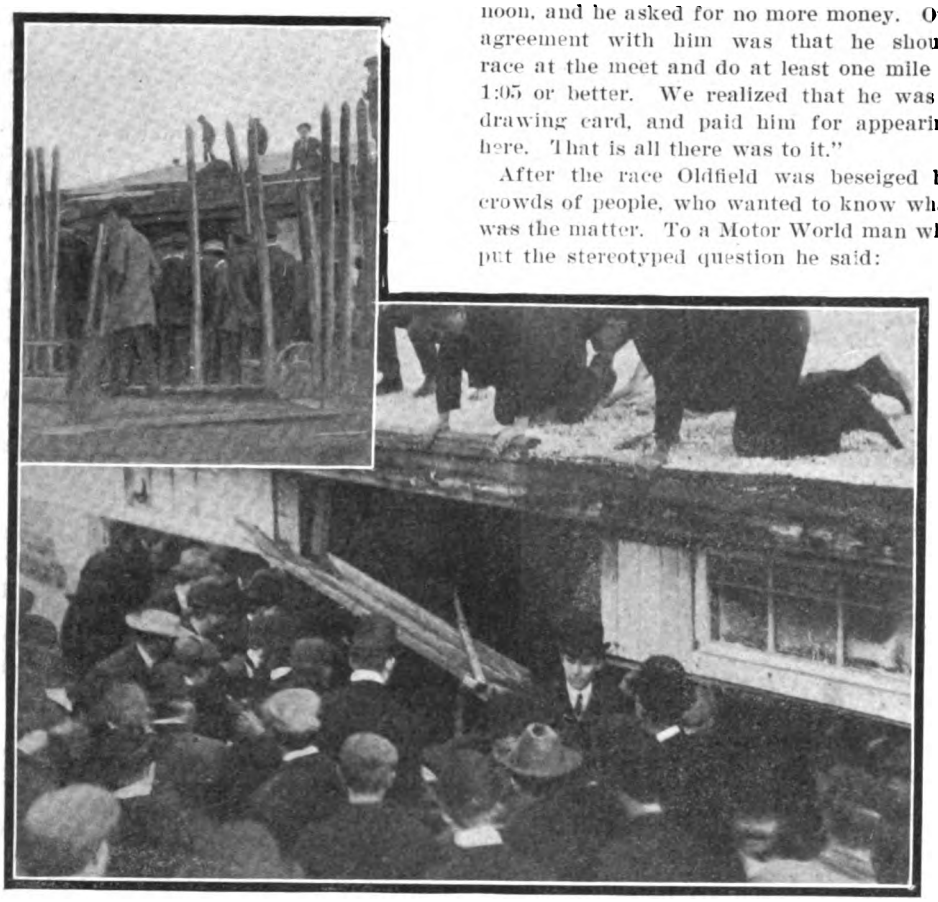
Three Views of the Crowd.



bee line for a row of stables at this point, on the low roof of which a number of spectators were perched. The tall picket fence dividing the track from the grounds was crashed into and went down as if it had been cardboard; with its speed unchecked the car next went into a low, whitewashed fence immediately in front of the stable, broke it and charged full into the stable, being stopped by the rear wall. Wridgway jumped before hitting the first fence and escaped with a strained wrist and a cut under the eye. He was able to be about on Monday. The car also got off remarkable well. It did not overturn, and nothing was broken except the right hand front wheel, which had its spokes sheered off. The axle end was badly twisted, but beyond this a close examination showed nothing wrong.

The chief influences at work in marring the meet were, first, that bane of automobile racing, absenteeism, and, second, the pitiable exhibition of driving given "by the champion automobile driver of the world, Barney Oldfield," as Announcer Prunty phrased it. The entry lists showed splendid fields for each race, but the ranks were greatly depleted by the non-starters, prominent among whom were Frank Kulick (Ford) and H. S. Harkness (Walter). Kulick's entry was received in due form, but he did not appear, and no reason was or has been assigned for his non-appearance. Harkness was at the track with his car, but an attack of disease diagnosed as "too much power" had put the latter hors de combat. The new E. R. Thomas 90 horsepower Mercedes was also looked upon as a starter, but as it had not been "tuned up" sufficiently it was scratched a few days prior to the races. With Kulick also out and A. G. Vanderbilt's huge Fiat, driven by Sartori, unable to negotiate the track at anything like its full speed, the feature of the meet, the international race, was practically left to be fought out by Oldfield (60 horsepower Peerless) and Bernin (60 horsepower Renault). When the former showed the white feather the race became a walkover—almost a farce.

The preliminaries of this race, which was the second one to be run, were most appetizing. Bernin and Oldfield won their heats handily, and Sartori got a place in the final through a walkover. Three countries were then represented—France, Italy and America—and excitement ran high. Oldfield's spectacular make-up—a loose, blouselike coat of flaring green, which matched the color of his car, the Green Dragon, topped by a shock of uncovered hair and with an unlighted stump of a cigar stuck aggressively in his mouth, appealed, as it was intended to appeal, to the gallery, and he was easily the cynosure of all eyes. Bernin suffered by comparison. He was clothed in nondescript chauffeur's garments, and was as untheatric in appearance as his rival was the reverse. Nor was the simile destroyed when the men were sent away after one false start. Oldfield was stagy, Bernin was businesslike. The Cleveland man at first hugged the pole—he had the inside berth at the start—and maintained

IMMEDIATELY AFTER WRIDGWAY'S CAR HAD PLUNGED THROUGH THE FENCE AND INTO THE STABLE.

a slight lead. But after the first mile he resumed his old tactics of swinging wide on the turns and taking the straights on the outside, thereby losing several hundred feet in each mile. This proved his undoing, for as they started on the third mile Bernin, who was following close and causing Oldfield to increase speed, kept to the middle of the track and went by, taking the lead on the turn. Thereupon Oldfield sat up and practically quit. Bernin left him further and further in the rear, and even Sartori came up and passed him. The spectators, who had risen to their feet in ecstasy at the promise of a splendid race, set down again and sighs and cries of disappointment arose on every side. A man on the rail offered the pertinent suggestion to Oldfield that the green of the Dragon should be diversified with a streak of yellow.

All sorts of stories were afloat concerning Oldfield's almost inexplicable action. One tale bandied around was that he had struck for more money upon seeing the size of the crowd, and, this being denied him, he had lived up to the letter of his contract, which called for a mile in 1:05 or better, and then quit. Some even went so far as to say that he carried a stop watch and timed his miles. That there was nothing in this story was made plain by Manager Alfred Reeves of the promoting club. To the Motor World man's question he replied:

"Not a word of truth in it. I never had any conversation with Oldfield that afternoon, and he asked for no more money. Our agreement with him was that he should race at the meet and do at least one mile in 1:05 or better. We realized that he was a drawing card, and paid him for appearing here. That is all there was to it."

After the race Oldfield was beseiged by crowds of people, who wanted to know what was the matter. To a Motor World man who put the stereotyped question he said:

"There is nothing the matter with the car; it was me that was wrong," and he grimly chewed the end of his cigar and did not even leave his seat to examine his car before the next race was called.

Later he explained more fully. He said that the track was narrow, with bad turns, and the heavy rain of Friday had left it soft and rutty in some places. The Green Dragon is a light car, only weighing 1,700 pounds, and at high speed it was very difficult to manage it on the turns. When Bernin pressed him on the third mile he increased his speed to the danger point, and it was not until he was within six inches of the outer fence, with Bernin still gaining, that his nerve deserted him. He thought of his St. Louis accident, where he had dashed into a fence with fatal results, and he saw, in his mind's eye, a repetition of that tragic occurrence and then he weakened.

Apparently the weakness did not pass away speedily, for throughout the afternoon he was unable to drive fast. He even asked to be excused from driving in the Brighton Handicap, alleging the poor condition of the track. Referee Pardington "put it up" to the judges, and they decided by a vote of two to one that he must start at least. This he did, but gave a farcical exhibition, even losing ground to cars that had starts on him.

Bernin and his new Renault racer, the latter owned by W. G. Brokaw, were easily the real stellar attractions of the meet. The car, the first speed production of the famous French firm since the Paris-Madrid race, is marked by an immense horseshoe shaped tubular radiator, partly encircling the rear portion of the bonnet. It ran grandly, silently and without a hitch or a skip. Its driver, Bernin, handled it to perfection. He took the turns without falter and without leaving the pole, and was literally "burnin'" up the track in his rapid flight. In the final heat of the international race he plainly took Oldfield's measure, gauged the latter's speed and took advantage of his tactical error in seeking the outside of the track by going by and leaving Oldfield a nerveless wreck. His time in the fifth mile of the international race —0:58 3-5—was the fastest of the day and is a record for the track.

The two men met again a few minutes later in the five-mile race for the Diamond Cup. Wridgway was the third starter, with a 24 horsepower Peerless touring car. Oldfield got away first, led to the turn and into the backstretch. Here he again slowed down and permitted Bernin to pass him and win as he pleased by three-quarters of a mile in 5:08 3-5, with Wridgway an eighth of a mile further back.

The heats of the Brighton Handicap were uninteresting, so widely separated were the cars, although at the finish of the second there was a close race. A recasting of the starts for the final bettered matters considerably. A good race resulted in Lewis Nixon's new 25 horsepower Standard, which received 115 seconds, beating Bernin, a 25-second man, by 100 yards, with Vaughn, who had 45 seconds, third, fifty yards back. Summaries:

Seabreeze Cup (one mile; handicaps according to price)—Won by L. T. N. Baldwin (10 horsepower Stanley), 300 yards; Rodney Peeler (10 horsepower Autocar), 100 yards, second; Clyde Adams (8¼ horsepower Cadillac), 250 yards, third. Time, 1:27 1-5.

International Cup (trial heats, three miles; final, five miles)—First heat (French machines) won by M. G. Bernin (W. G. Brokaw's 60 horsepower Renault); Guy Vaughn (40 horsepower Decauville), second; time, 3:06 2-5. Second heat (Italian cars)—Walkover for Paul Sartori (A. G. Vanderbilt's 90 horsepower F. I. A. T.). Third heat (American cars)—Won by Barney Oldfield (60 horsepower Peerless); C. G. Wridgway (24 horsepower Peerless), second; time, 3:25 3-5. Final heat—Won by Bernin; Sartori, second; Oldfield, third. Time, 5:05 3-5.

Diamond Cup (five miles, free for all)—Won by M. G. Bernin (W. G. Brokaw's 60 horsepower Renault); Barney Oldfield (60 horsepower Peerless), second; C. G. Wridgway (24 horsepower Peerless), third. Time, 5:08 3-5.

Brighton Handicap (five miles): First heat —Won by Rodney Peeler (10 horsepower Autocar), 225 seconds; M. G. Bernin (W. G. Brokaw's 30 horsepower Renault), scratch, second; Philip Adams (25 horsepower Standard), 35 seconds, third; time, 8:49 4-5. Second heat—Won by Guy Vaughn (40 horsepower Decauville), 50 seconds; C. G. Wridgway 24 horsepower Peerless), 45 seconds, second; Barney Oldfield (60 horsepower Peerless), scratch, third; time, 6:49. Final heat—Won by Philip Adams; M. G. Bernin, second; Guy Vaughn, third. Time, 8:17.

BIG FEE; SMALL CROWDS

Los Angeles Raises the "Ante" and Loses—Fast Times the Rule on Both Days.

Los Angeles, Oct. 24.—Due to an overreaching desire to make much hay while the sun shone, the second annual meet of the Automobile Club of Southern California was not what it might have been. While more than one thousand spectators were present each day, there is no doubt that the price exacted for a seat in the grandstand, $2.50, kept away very many more thousands, particularly as the sun shone brilliantly and all other weather conditions were perfect.

Although the races occupied all of Friday and Saturday afternoons, there were so many of them, and they were so long drawn out, that it was necessary to postpone two of them until this morning.

The races themselves were fairly interesting, fast times being the rule. Frank A. Garbutt, in his California made car, which ran into trouble on a previous occasion, "made good" this time by reeling off a mile in 57 2-5 seconds, which was hailed out here as the "world's amateur record," although the A. A. A. does not differentiate between performances by amateurs and professionals.

George P. Fuller, in his Pope-Toledo, was conspicuous also, his mile in 1:00 3-5 in the Coast championship event being the "American record for an American stock car driven by an amateur." His car narrowly escaped destruction on the first day. He used 86-degree gasolene, which, leaking from the tank, was ignited by spark gaps that he employed. It was saved by a couple of quick-witted fellows, who seized a plank and knocked off the tank. The car was damaged, but not enough to prevent its use the next day.

While Pope-Toledos won the lion's share, the victories were pretty well distributed, as the following summaries show.

FIRST DAY, OCTOBER 21.

Five miles, for 10 horsepower cars costing $1,000 or less—Won by David Campbell, Los Angeles (Ford); R. C. Hamlin, Los Angeles (Pope-Hartford), second; A. Hoxie, Los Angeles (Royal Tourist), third; W. G. Hanson, Los Angeles (Hanson), fourth. Time, 6:30; fastest mile, 1:16 1-5.

Five miles, for American touring cars in touring condition—Won by W. McDonald, San Francisco (Pope-Toledo); H. D. Ryus, Los Angeles (White), second; H. C. Turner, Los Angeles (Peerless), third. Time, 7:01 2-5.

Five miles, for cars of 15 horsepower or less, one or two cylinders, costing $1,000 or less—Won by David Campbell, Los Angeles (Ford); A. Hoxie, Los Angeles (Royal Tourist), second; W. G. Hanson, Los Angeles (Hanson), third. Time, 6:34 1-5. Fastest mile, 1:16.

Five miles, for gasolene cars of 24 horsepower or less—Won by Frank Siefert, Los Angeles (Thomas); Thomas Elliss, Los Angeles (Thomas), second; W. K. Cowan, Los Angeles (Rambler), third. Time, 6:38; fastest mile, 1:18 1-5.

Five miles, for cars of 30 horsepower or less—First heat: Won by Frank A. Garbutt, Los Angeles (Stewart-Garbutt); M. S. Harris, San Francisco (Pope-Toledo), second; H. M. Zier, Pasadena (Thomas), third. Time, 5:15. Fastest mile, 1:00. Second heat: Won by Bert Dingley, San Francisco (Pope-Toledo); E. D. Keller, Los Angeles (Peerless), second; H. C. Turner, Los Angeles (Peerless), third. Time, 5:38 2-5. Final heat—Won by Garbutt; Dingley, second. Time, 5:25. Fastest mile, 1:00 3-5.

Australian pursuit race—Won by H. M. Zier, Pasadena (Thomas); A. Hoxie Los Angeles (Royal Tourist), second. Time not taken.

SECOND DAY, OCTOBER 22.

Five miles, for Huntington $1,000 Challenge Cup—First heat: Won by George P. Fuller, San Francisco (Pope-Toledo); H. C. Turner, Los Angeles (Peerless), second. Time, 5:23. Second heat: Won by Frank A. Garbutt, Los Angeles (Stewart-Garbutt); M. Harris, San Francisco (Peerless), second; J. D. Hill, San Francisco (Mors), third. Time, 5:43 3-5. Final heat: Won by Garbutt; Fuller, second. Time, 5:14. Fastest mile, 0:57 2-5.

Ten miles, for road cars of 15 to 24 horsepower, costing $2,500 or less—Won by Frank Siefert, Los Angeles (Thomas); H. M. Zier, Pasadena (Thomas), second. Time, 13:54 1-5.

Five miles, championship of Pacific Coast automobile clubs, for Lowe Challenge Cup—Won by George P. Fuller, Automobile Club of California; M. S. Harris, Automobile Club of California, second; H. C. Turner, Automobile Club of Southern California, third. 5:22 2-5. Fastest mile, 1:00 3-5.

Five-mile International Free-for-All—First heat: Won by George P. Fuller, San Francisco (Pope-Toledo); E. D. Keller, Los Angeles (Peerless), second. Time, 5:18 2-5. Second heat: Won by Bert Dingley, San Francisco (Pope-Toledo); M. S. Harris, San Francisco (Peerless), second. Time not taken. Final heat: Won by Dingley; Fuller, second. Time, 5:18.

Five miles, for touring cars, any make or power, carrying four passengers—Won by A. P. Witterauer, Los Angeles (White); W. McDonald, San Francisco (Pope-Toledo), second. Time, 7:34.

Five miles, Chanslor Challenge Cup—First heat: Won by Bert Dingley, San Francisco (Pope-Toledo). Time, 5:28. Second heat: Won by George P. Fuller, San Francisco (Pope-Toledo); H. C. Turner, Los Angeles (Peerless), second. Time, 5:20. Final heat: Won by Dingley. Time, 5:09 3-5 (new record for California and Pacific Coast).

Ten-mile pursuit race—Won by Bert Dingley, San Francisco (Pope-Toledo); E. D. Keller, Los Angeles (Peerless), second; W. G. Schroeder, Los Angeles (Thomas), third; Frank Siefert, Los Angeles (Thomas), fourth. Time, 10:39.

"BIG THREE" WERE THERE

Oldfield, Kiser and Fisher Show at Grand Rapids—Small Accidents Cause Excitement.

Barney Oldfield, Earl Kiser and Carl Fisher were the magnets that drew four thousand spectators to the races at Comstock Park, Grand Rapids, Mich., on October 18. Fisher and Oldfield contented themselves with exhibitions, and Kiser competed in a match race, in which he drove a borrowed 24 horsepower Pope-Toledo against Barney Oldfield's helper. Though the famous Peerless Green Dragon was not seen in competition, it established some new track records in an exhibition. Oldfield's first appearance was in a five-mile exhibition, for which his time was 5:02 2-5, the fastest mile being the last, in 59¼ seconds. He later drove the Green Dragon in a three-mile exhibition in 2:52.

Carl Fisher had been expected to meet Kiser in a match race, but an accident put the Premier Comet out of commission. Fisher accordingly borrowed a Peerless and drove an exhibition of two miles in 2:08. William Starring, Oldfield's helper, won the event for touring cars with a Peerless, but was disqualified, as he was not a resident of Grand Rapids. Starring won his five-mile match from Kiser by half a length, Kiser driving a regular model Pope-Toledo. Mrs. Squires was leading in the first mile of the ladies' race when her machine was stopped by the brake setting. It whirled half around and stopped, but she was not injured. In the five-mile event, for medium weight cars, William Russell, in a Michigan, had a big lead at the end of the fourth mile, when he stopped, as he thought the race was over. In the last mile of the race J. R. Jackson struck the Cadillac driven by Ernest Kemp and sent it crashing into the fence. The Cadillac was overturned and badly damaged, but Kemp escaped injury. Summary:

Three miles, for runabouts costing $800 and less—Won by W. H. Leaver (Cadillac); H Bayer (Cadillac), second; Arthur Mesnard (Rambler), third. Time, 6:51½.

Two-mile ladies' race—Won by Mrs. George Hart (Franklin); Mrs. E. G. Squires (Ford), second. Time not taken.

Five-mile open—Won by William Starring (Peerless); William Russell (Michigan), second; John Thoma (Rambler), third. Time, 8:09

Five-mile match between William Starring (Peerless) and Earl Kiser (Pope-Toledo)—Won by Starring. Time, 8:08.

Five-mile open, for cars weighing from 901 to 1,432 pounds—Won by J. R. Jackson (Franklin); C. E. Amsden (Franklin), second; William Russell (Michigan), third. Time not taken.

Five-mile race for touring cars, Grand Rapids drivers—Won by Mortimer Lace (Royal); W. S. Austin, second. Time, 8:46.

Three-mile invitation for Cadillac Cup—Won by Claude Hamilton; W. H. Leaver, second. Time not taken.

Five-mile handicap—Won by John Thoma (Rambler); W. E. Russell (Michigan), second; C. E. Amsden (Franklin), third. Time, 7:55 2-5.

RUNAWAYS AT ST. LOUIS

Good Crowd Sees Indifferent Sport and Gets a Large Dose of Kiser Exhibitions.

Earl Kiser was the star of the races which were held last Sunday at St. Louis, though he only drove the Winton Bullet in three exhibitions. Several thousand spectators witnessed the races, though the cold weather undoubtedly affected the attendance. The memory of Oldfield's fatal accident there recently did not make the spectators any more cautious, for they lined the fence at the head of the stretch and in front of the clubhouse. None of the races were close, so that all of the contestants kept close to the rail and the crowd sat on the fence in safety.

Kiser's first appearance was in a five-mile exhibition to become accustomed to the track, his time being 5:49 3-5. His next ride was for ten miles, in 11:13. The sixth mile was the fastest, 1:06 1-5 being the time. Then Kiser tried for the track record of 5:25, held by A. C. Webb, and succeeded in placing it at 5:19. The first mile, in 1:02 2-5, was the fastest. The track was slow owing to the earth which had been used to bank the turns. C. A. Tileson won the first event for heavy cars carrying four passengers. His only opponent had trouble with his machine, which was out of the race after the first mile. W. M. Leathers had an easy time winning the five-mile event for medium weight cars from three opponents. Richard Hurck led the field for two miles in the five-mile motorcycle race, but his motor balked and he failed to secure a prize. The machines were limited to 110 pounds, and over a dozen started in the race, which was won by E. F. Martin, with 100 yards to spare. Summaries:

Five miles, for owners; road equipment; carrying four persons; weight 1,432 to 2,204 pounds—Won by C. A. Tileson; E. B. Godsey, second. Time, 8:30 2-5.

Five miles; flying start; cars weighing 1,432 to 2,204 pounds—Won by G. P. Dorris in straight heats; C. A. Tileson, second. Time—First heat, 6:23; second heat, 6:56.

Five-mile motorcycle race, 110 pounds limit—Won by E. F. Martin; T. Bahnsen, second. Time, 8:00.

Five miles, for cars weighing 881 to 1,432 pounds—Won by W. M. Leathers; Robert Britton, second. Time, 7:57.

Two miles, flying start, for cars weighing 881 to 1,432 pounds—won by E. B. Godsey; Robert Britton, second. Time, 3:28 2-5.

Five-mile exhibition, Earl Kiser. Time, 5:49 3-5.

Ten-mile exhibition, Earl Kiser. Time, 11:13.

Five miles against time, Earl Kiser. Time, 5:19.

It has devolved upon the Rev. A. C. Diffendorfer, of Plainfield, N. J., to call the much maligned "devil wagon" to the aid of the Church, as he has arranged that automobiles will be used to carry the infirm members of his flock to church.

A.A.A. Race Committee Meets.

The report of the committee of the American Automobile Association having the Vanderbilt Cup race in charge was formally accepted by the racing board of that organization at its meeting last Monday afternoon. It thereupon awarded first and second places to George Heath and Albert Clement, respectively. The refunding of the entrance fees to all the cars that entered and competed was also authorized.

Chairman A. R. Pardington presided at the meeting, which was held in the rooms of the Automobile Club of America. The other members present were William K. Vanderbilt, jr., James L. Breese, A. L. Riker and E. T. Birdsell.

A discussion regarding next year's race came after the transaction of the routine business, and was entirely informal in character. Chairman Pardington said afterward that no attempt had yet been made to consider the same Long Island course as either favorable or not for the next race. Many members are inclined now to favor a course that will offer more variety for an all round test of the machine.

"But with the variety," added Mr. Pardington, "we have got to consider the case of good roads. We may be able to get one of the desired qualifications without finding the other requisite, and good roads, just at present, seem to be the paramount necessity for a successful road race."

Considerable discussion arose over an abortive attempt to have the dates of the Ormond-Daytona races set back. The sanction of the A. A. A. racing board covers the days January 23 to 28 inclusive, and these were deemed by the managers of the Importers' Salon, the dates of which are January 11 to 24, to conflict with their exhibition. They asked, therefore, that the Ormond dates be changed. W. J. Morgan, on behalf of the Florida East Coast Automobile Association, vigorously opposed this, and presented maps and diagrams of the sun, moon and stars, which showed conclusively that the tides would be favorable only on the days for which the sanction had been granted. The A. A. A. board appeared to take the same view of the matter, for they refused to make any change in the dates.

Canadian Compete at Montreal.

The Automobile Club of Canada held its first race meet at Delorimer Park, Montreal, on October 15. Nearly every machine in the city was at the grounds and took part in the parade which finished the afternoon's sport.

Summaries:

Two miles, Stanley steamers—Won by L. D. Robertson; W. Carruthers, second. Time, 4:12.

Two miles, Queen gasolene cars—Won by Mr. Husson; L. D. Patenande, second. Time, 4:54½.

Two miles, Ramblers—Won by Dr. Arthur Wignault; Mr. Ahem, second. Time, 4:52.

Two miles, imported cars—Won by D. McDonald (Renault); D. Yuile (Panhard), second. Time, 3:49½.

Five miles, free-for-all—Won by L. D. Robertson (Rambler); D. McDonald (Renault), second. Time, 8:18.

BIG MATCH RACE ARRANGED

Four Famous Drivers to Contest on Empire Track—Oldfield's Chance to Redeem Himself.

On Saturday afternoon four world famous drivers in four world famous cars will meet in battle royal at the Empire City track, Yonkers, N. Y. Professionals all—or with possibly one exception—accustomed to risk life for the sake of gain, they will cast aside all, or nearly all, thought of lucre and strive for fame and reputation. Each man is eager to race and confident of winning, and to accommodate them and to let the public in on a "good thing" the Empire track management has arranged an impromptu meet, with this race as the piece de resistance and a few "specials" to garnish the feast.

The personages in this interesting drama are the following: Leon Thery, Gauloise, winner of the 1904 Bennett Cup race and, by virtue of that victory, a claimant to the proud title of "champion of the world," who will drive the 90 horsepower Georges-Richard car with which he achieved that success; M. G. Bernin, Franco-American, victor on many hard fought fields, conqueror of the once mighty Oldfield, of whom more hereafter, and driver of the latest speed car of the famous Renault house; Paul Sartori, Italian, a mighty driver in his own sunny land, but one who has yet failed to show top form here, who will handle the wheel and levers of Alfred G. Vanderbilt's new 90 horsepower Fiat racer, and, last of all, Barney Oldfield, American (with an Irish blending), erstwhile the daringest of drivers and the darling of speed lovers throughout the broad United States, but now dethroned, contemned and disconsolate, who will drive the 60 horsepower Peerless Green Dragon.

That it will be a sight worth going miles to see need scarcely be said. There will be personal contention, international emulation and trade rivalry to spur the men on. Thery and Bernin have reputations to maintain, Oldfield and Sartori reputations to regain. Each is confident of the outcome and impatient to obtain the word to go. Thery's hope is to return to France after a meteoric visit, exclaiming, "I came, I saw, I conquered!" Bernin seeks to repeat his victory of Saturday; Oldfield to turn the tables on his conqueror. That he can do this on the 100-feet wide Empire track the latter firmly believes, and he is ready to back his belief to the extent of his "pile"—common report places this at $5,000.

The men will race for a trophy and medals. The distance is ten miles, to be run in two heats and a final, two men in each heat and the winners in the final; the heats also to be at ten miles and the drawings for heats and places to be by lot. Standing starts are provided for in the heats. The fact that Oldfield's car has only two speeds is known to his competitors, hence the last stipulation. The races will start at 2:30 o'clock.

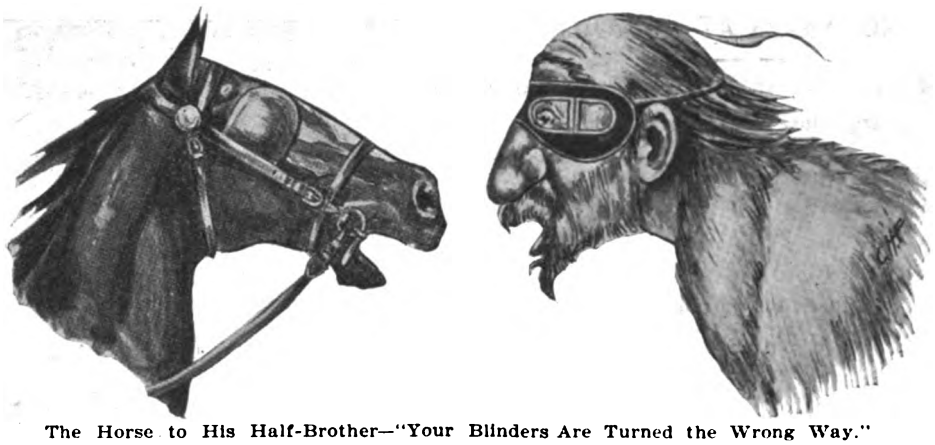
PREPARING FOR WINTER

Some of the Things the Careful Motorist May do to Preserve His Car.

With the approach of winter a certain number of motorists will lay up their cars until the advent of spring. Those who make up their minds not to use their cars will do well to carefully put them to bed and tuck them up, making all comfortable and snug.

All water should be carefully drained out of radiator and tanks; this is best done after running the engine until the water boils and everything is piping hot. This will effectually dry up the interior of tanks and pipes. Gasolene tanks and carburetter should then be emptied of fuel, and the lubricating oil tanks and crank chamber should also be cleaned out and rinsed with kerosene. .

The careful motorist will take off his pneumatic tires, wrap them up carefully in brown paper (waterproof paper is best) and give a final overcoat of bagging. Pneumatic tires, if exposed to light and air, oxidize and the essential oils of the rubber become resinized and harden. In time this oxidation penetrates right into the rubber, and it becomes hard and brittle and breaks away when the tire is put on the road. A certain amount of elasticity may be restored to the tire by immersing it in boiling water, but this remedy is only a makeshift and providing the oxidation has not penetrated far. Therefore it is essential to keep the tires from light and air and in an equable temperature.



If the car owner does not wish to remove the tires, they should be carefully wrapped round with strips of coarse canvas and all four wheels jacked off the floor. The canvas strips should be thoroughly dusted with powdered sulphur, which preserves the rubber.

The car should be extra carefully washed down and all accumulation of mud and oily dirt thoroughly cleaned from every nook and cranny, joints and oil holes. All oil holes, joints, axle boxes, differential and gear case can then be filled up with grease.

Chains should be taken off, thoroughly washed in a kerosene bath, allowed to drain and then soaked in grease. Make the grease hot and lay the chains in it.

All metal parts should be well smeared with a mixture of white lead and tallow—about one part of lead to three parts of Russian tallow—the proportion is not by weight.

The house in which the car takes its winter's sleep should either be kept at a temperature of about 60 degrees both night and day or left cold all the time. If the place is warmed in the daytime only, the moisture in the air will condense on all cold parts of the car and do more damage than if left cold. Of course, it is better to warm the building, but it must be kept warm all the time. If the garage cannot be warmed it is advisable to store all loose cushions and other removable parts in a house away from damp, etc.

The Horse to His Half-Brother—"Your Blinders Are Turned the Wrong Way."

A kerosene lamp placed in the centre of a tray containing sand is a perfectly safe and cheap method of warming a small garage, but it must be kept burning continuously. The sand should be changed if the kerosene leaks on to it.

A sheet or calico waterproof should cover the whole of the car, and on bright, sunny days it will do good to open the doors, take the cover off and give all an airing.

About Valve Grinding.

After grinding valves it is often found that the compression is not so good as it should be, notwithstanding the fact that both valves and seating have been perfectly ground. It must be remembered that grinding tends to lower a valve, even if the action is very slight. It may be that the tappet rods do not allow the valves to close sufficiently. This is particularly true with the exhaust valve. Should the valve stem rest on the tappet rod, the end should be slightly filed or ground to shorten it to the extent that it does not quite reach the rod. It is a safe thing to allow sufficient space between the end of the rod and the valve stem to pass a piece of thin cardboard between the two when the valve is closed. If this space is not left the valve will rest on the tappet and the compression will be impaired.

Valve grinding is a tedious but very simple operation. Some fine flour of emery must be procured and mixed with oil to form a fairly thick paste. Smear some of this on the edge of the valve when the latter has been removed. Place some on the seating also. Drop the valve into place again. By means of a screwdriver or other tool, turn the valve round and round, and occasionally backward, using sufficient force to always keep it against the seating. Quite frequently take the valve out and see how the work is going on, but continue the grinding until both surfaces are absolutely bright and even all around, there being not the least mark anywhere. When the grinding is completed wipe all parts off carefully and see that all paste is off the valve and the seating.

If a microscope is used on even the smoothest surface turned out by man, it will be seen that, no matter what the surface under inspection is, it is full of inequalities. Pure flake graphite will fill these irregularities, substituting for it a veneerlike coating of great smoothness and endurance. The graphite may be introduced into the cylinder of an automobile by placing a very small quantity of it in the crank case—not over a teaspoonful to each quart of oil used. When the engine is standing the graphite will settle in the oil, but once it is in motion enough of the graphite is stirred up to fill all the pores of the cylinder walls.

Using the Teeth to Detect Trouble.

While the ear of the motorist is his chief detective when symptoms of trouble assert themselves, the tip comes from abroad that the teeth constitute an even surer means of locating internal distress. Hold one end of a steel rule between your teeth and apply the other against the side of the cylinder of a running motor, says the foreign tip, and it will "enable you to detect the difference between the noise of knocking 'big end' or 'little end' of bearings and the clatter of valves or the squeak of piston rings." If you are equipped with false teeth the experiment is "off."

The Right Way to Clean Chains.

When cleaning chains, soak them in kerosene, then dry and immerse in hot tallow. If considerably stretched, the chain should be renewed. It is useless to remedy a badly stretched chain by the radius rods. The radius rod will do up to the extent of one link, but after that the difference in pitch between the chain and sprocket becomes too great for proper running.

When Renewing the Clutch Leather.

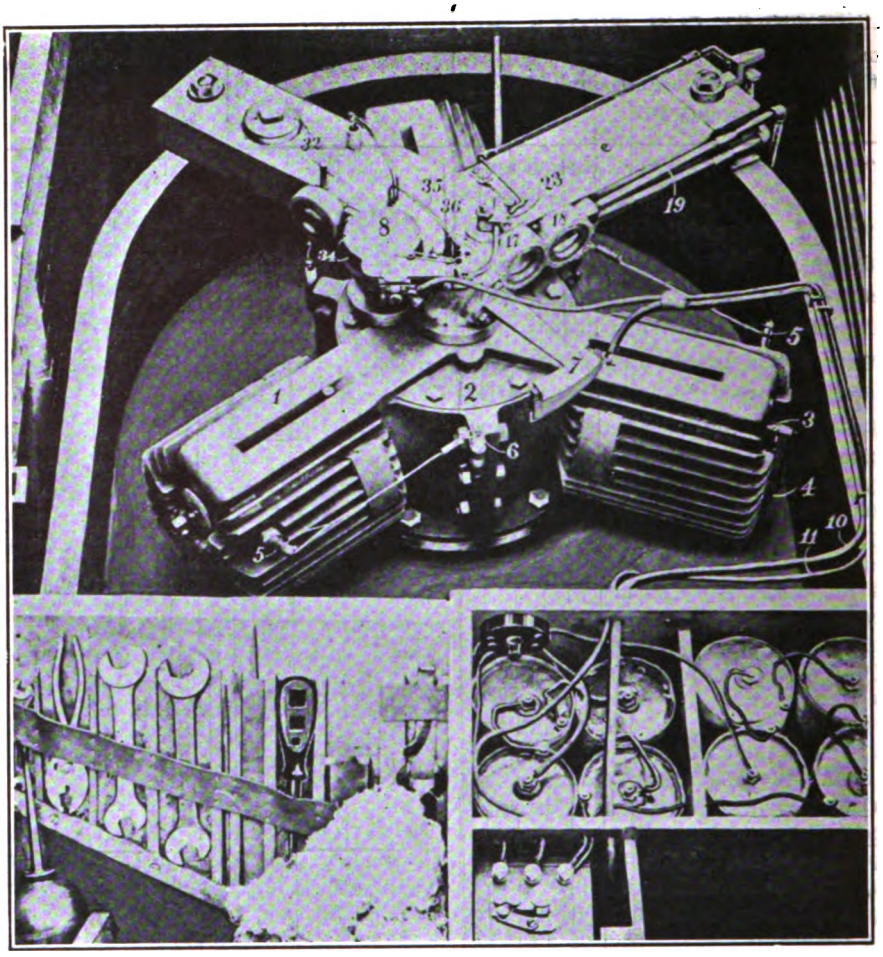
In renewing the leather on your clutch use care in removing the rivets so that the old leather may be intact after removal. It will then be useful to mark out the new one by. In the new leather countersink the holes for rivet heads and put it on with the rough side out. It is well to soak it in castor oil, as that aids greatly in adapting the shape to the female part of the clutch.

In connection with their Philadelphia branch, Thomas B. Jeffery & Co. have established a warehouse at Nos. 1,249-51 North Twenty-seventh street.

Digitized by Google

RADICAL DEPARTURES.

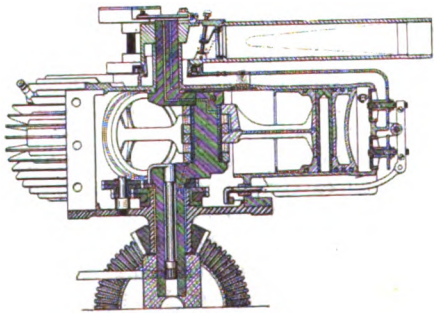
(Continued from page 181)



will be locked. In this position the car will be securely held on a hill or elsewhere. As soon as the clutch lever is moved to engage either the backing or low forward gear the brake is automatically released. This is of importance, for without this automatic release one may forget to release the brake before engaging the clutch.

The steering gear is claimed to combine the quick action of lever steering and the safety of wheel steering. A cam movement is interposed between the steering knuckle and the hand lever that is practically irreversible and relieves the hand entirely of shocks caused by the wheels striking an obstruction. It is possible to cross car tracks "on the bias," to run over brick, stones or dogs with no tendency to divert the car from its course. The control column from which the steering lever is hinged forms a rigid hold for the left hand, giving the operator great leverage, and at the same time the left hand is in position to instantly release the clutch or change gear, while with the right hand a quick turn may be made. A quick turn and a stop alone will often avoid a collision. The controlling levers and pedals do not in the least interfere with entrance or exit from either door or side, and the occupant of either seat may step directly from the car to the sidewalk without climbing over levers or pedals.

The Adams-Farwell revolving cylinder, air cooled, gasolene motor is claimed to have distinctive advantages because of its compactness, its perfect balance, light weight, wide range of speeds and power and practical air cooling under all conditions.



It reverses the ordinary practice, in that the engine cylinders revolve and the crank shaft is stationary instead of the crank shaft revolving and the cylinders being stationary. It is not what is usually termed a rotary engine. Three units, each being a complete cylinder, with cylinder head and one-third of a central crank case cast in one piece, are bolted together and bolted to a top and bottom cast steel flange, which has bronze bushings, forming bearings around the vertical stationary crank shaft. This forms the revolving unit, and is, of course, balanced perfectly. This revolving unit in a twenty-horse power engine, with 5 inch bore and 4½ inch stroke, weighs 190 pounds, and forms the flywheel.

In each cylinder is a cast piston having four rings. The three pistons are connected to a single crank wrist pin of very large proportions by bronze pitmans. The pitmans, with the pistons at their outer end, swing around the stationary wrist pin in practically perfect mechanical balance. The wrist pin being eccentric with the axis of the revolving cylinder unit the pistons are caused to reciprocate back and forth in the cylinder at each revolution of the revolving unit, although the speed of the mass of the pistons does not change or stop and return at each dead centre as with the ordinary engine. It is, therefore, susceptible to a very perfect mechanical balance. The action of the exploding charge is practically the same in this engine as in the ordinary kind, except for the smooth running caused by the variable compression control.

THE ADAMS-FARWELL MOTOR.

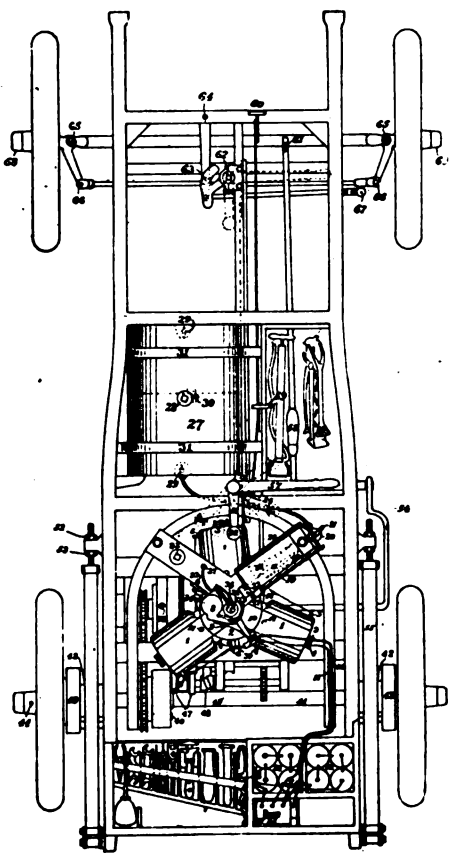
All engines exert a force or torque in two directions during the explosive or power stroke. A force or torque tends to turn over the crank and with it the flywheel in one direction, and an equal force or torque tends to turn the engine, cylinders, casings, etc., in the opposite direction. The ordinary engine has the cylinders and case secured to a foundation, and they cannot turn, but the crank shaft is free to turn. The Adams-Farwell has the crank shaft secured so it cannot turn, but the cylinders are free to turn. The ordinary engines transmit their power from the crank shaft; the Adams-Farwell transmits power by bevel gear from the revolving crank case. This is the difference technically, but the builders claim distinctive advantages for this motor, where lack of vibration, light weight, simplicity, practical air cooling under all conditions, wide range of speed and accessibility to all parts are desiderata.

SECTION OF MOTOR.

A single central crank case answers for the three cylinders. A single throw crank of about one-third the weight of the three throw crank found in the other type of engines is employed. A single valve operating cam opens both inlet and exhaust valves. As the entire engine revolves except the crank shaft and base, the engine is its own flywheel, and, being heavy, 190 pounds, is conducive to very steady running.

No muffler is employed. Because of the velocity of the cylinders passing through the air a muffler of the ordinary type may be entirely dispensed with. Auxiliary exhaust ports, which let out the high terminal pressure against the rapidly receding volume of air, are used. The discharge acts upon the air like a skyrocket, and not like a gun. It is asserted that there is less noise with this system than with the ordinary engine, when both are working at full power, and that the exhaust cannot be heard when the engine is working at part power; there is claimed to be absolutely no back pressure; the auxiliary exhaust ports reduce the pressure to that of the atmosphere before the exhaust valve in the head of the cylinder is open. The gases that pass out of the exhaust valve are there-

Digitized by Google



fore comparatively cool. The annoyance of pitted and warped exhaust valves is entirely overcome. The duty required of the valve operating levers, cams and gears is very light, as there is no terminal pressure in the cylinders when the valve is open. The valves are closed by centrifugal force; this force is in proportion to the requirements. The higher the speed of the engine the greater the force, and the greater the need of a stiff spring or force to close the valve. The springs used are made of light piano wire, and are useful only to close the valves in starting the engine, where the centrifugal force at the slow starting speed might not be sufficient to overcome the resistance of cold lubricating oil on the valve stems. After the engine is slightly warmed every spring might be removed, and the engine could be started and run as perfectly as with the springs.

Air cooling is effectually accomplished by the cylinders revolving at a rapid rate, drawing in air at the centre and expelling it with great rapidity at the periphery or ends of the cylinder. The cylinders are provided with longitudinal ribs cast integral with the cylinders, which provide a large radiating surface. Every particle of air that is in contact with any part of the engine one instant is thrown off with great velocity by centrifugal force, and must be replaced with air drawn in at the centre.

The speed of the motor is controlled entirely by their variable compression system, which consists of allowing that part of the charge not needed to give the motor the required power to escape back by the inlet valve, which is mechanically held open for a part of a compression stroke, that part of the charge so escaping being drawn in by another cylinder. There is no waste of gases. When the maximum power is required the inlet valve is closed at the end of the suction stroke and the full charge is compressed to about ninety-five pounds per square inch. When minimum power is wanted the inlet valve is not closed until the completion of the compression stroke; an exceedingly small part of the charge is retained and ignited by atmospheric pressure, giving a gentle expansion. A range of power and speed anywhere from maximum to minimum or vice versa can be had instantly or gradually as desired. It is possible when the vehicle is on the high gear to follow a walking horse or to spurt up to a forty mile clip without manipulating any brake, clutch, spark or carburetter levers. Variable compression is the entire source of control. This system of control is claimed to be very economical, to be conducive to very smooth running, to obviate the necessity of heavy exhaust valve springs, to run much cooler and to keep the cylinder heads and spark plugs entirely free from sooty deposits.

The carburetter is entirely automatic at all speeds, no attention being required after once adjusting. Gasolene is pumped through the upper pipe 19 into the constant level reservoir 18, which is a small cavity covered with a watch crystal, enabling the gasolene to be seen, and water, if any, detected. The surplus gasolene flows back into the pump well 20 through the lower tube.

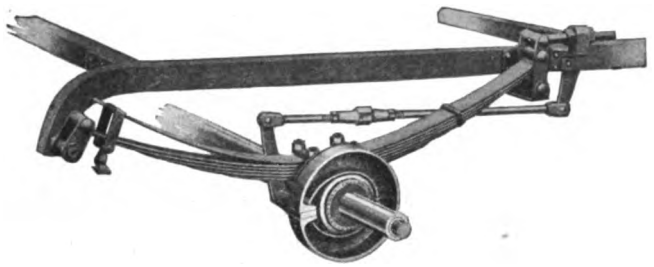
An opening connecting the reservoir with the valve 23 is regulated by a needle valve, the hand of which is at 26. The air, after passing through the linen bag 24, which prevents dust entering, raises the little swing valve and at the same time the gasolene valve 23, forming a vapor which enters the central chamber, and thence out through the channel at the top of the cylinder and through the inlet valve 3. The sectional view will show this clearly. The proportion of air and gasolene is always the same, and the quality of the mixture is constant, but the quan-

tity varies according to the power required and the position of the variable compression cam. The mixing valves are opened only after the sucking cylinder has drawn in that part of the charge which the compressing cylinder is blowing back by its inlet valve.

The spark is regulated automatically by their automatic spark regulator, which fires the charge at all speeds at a point to produce the greatest efficiency. This is a device employing a centrifugal governor, which not only advances the spark when the speed of the engine increases, but also increases the length of the contact of the primary circuit. A contact of the primary circuit for one-thirty-sixth of a revolution of the engine gives sufficient time for the spark coil to become saturated and give a good spark when the engine is running 150 revolutions or less. This contact is automatically increased to about one-twelfth of a revolution of the engine when running at 900 revolutions per minute. This is claimed to be a great saving of battery current and contact breaker points, for without this variable contact it is necessary to make the contact of the primary circuit long enough for the highest speed, therefore using two or three times as much current when the engine is running slowly.

There is but one spark coil. The highest tension current is wire 10 connected to the commutator 7, which is an insulated segment with a brass strip on the lower edge. On each cylinder there is a wire which leads from an insulator 6 to the spark plug 5. On the top of insulator 6 is an adjustable brass cap, which is adjusted to pass under the commutator strip 7 without quite touching. In operation, as the cylinder that is at the time compressing approaches the position straight back (which is the dead centre position), the insulator 6 is passing under the commutator and the contact breaker breaks the primary circuit and a spark jumps the gap between the commutator 7 and porcelain 6, and thence to the spark plug and into the cylinder.

When the motor is started the spark is late and jumps the gap at the extreme right hand end of the commutator; a back kick is impossible. As the speed of the engine increases the automatic spark regulator advances the spark and it jumps further and further toward the left end of the commutator. The exact position of the spark can be seen while the motor is in motion.



The oiling of all parts of the motor proper is cared for by an automatic, positive feed oil pump. It consists of a circular barrel in which are four cam actuated plungers. The barrel is positively driven by a worm gear; there are no ratchets, springs or valves; it will positively deliver one drop of oil to each of four tubes every one hundred revolutions of the engine. Two of these tubes lead to a distributing channel in the upper end of the crank shaft and oil the top of each cylinder; one tube leads to the upper end of the wrist pin, and from thence to the lower crank shaft bearing; a surplus accumulating in the crank case lubricates the valve operating cams and gears. An opening on each side of each cylinder admits oil from the crank case to the cylinder, thus oiling each cylinder and piston at three equa-distant points. The fourth tube is an extra, and is usually turned to deliver its oil back into the tank. The oil tank is located in the left end of the angular aluminum casting, which forms a support to the upper end of the crank shaft. Being very close to the engine, it is kept warm in the winter time, and the tubes leading from the pump are very short and not liable to be broken.

Easy accessibility to all parts of the motor, transmission and running gear mechanism is claimed for this car. The entire motor mechanism is under and back of the rear seat. The gasolene tank and a convenient receptacle for carrying tire pump, extra inner tubes, jack, etc., are under the floor between the seats. The large space under the front seat (some five cubic feet) will be found con-

Digitized by Google

venient for storing away touring baggage, picnic baskets, etc.

In the view of the chassis, all of the parts shown are accessible, and without removing the body. A small trapdoor under the front seat gives access to the forward steering gear mechanism; the floor between the seats is easily removable, as is also the rear seat. For ordinary attention and adjustment, however, the raising of the sloping top of the body is all that is necessary. From this position you will find exposed to view and readily accessible every part of the motor proper that will ordinarily ever require examination or adjustment; also every necessary tool required in these adjustment, each in a separate pocket, so that a glance will inform you if all necessary tools are aboard. Two sets of batteries, a spark coil and a double throw switch, which will enable either set of batteries to be used separately or both together after they have become too far exhausted to run the engine separately; you will find every inch of electrical wire exposed to view, and a loose connection can at once be located. A few extras, such as spark plugs, valves, bolts, nuts, springs, etc., an extra supply of lubricating oil, an oil can, some waste and a pair of asbestos tanned gloves will find room here.

ADAMS-FARWELL VARIABLE SPRING.

With no compression, the cylinders may be easily turned around, bringing any one in convenient position for removing spark plug or valves. All valves are duplicate. A cage forming the valve seat and guide for the vale stem is screwed into the head of the cylinders. Should a valve leak it can be replaced by another in a few minutes on the road and the grinding in process done at your leisure.

There is not a gasket or packed joint about the entire engine. The cylinder heads and one-third of the central crank case are cast integral with the cylinders. There is no hose or rubber tubing whatever about the car. The brass gasolene pipe, some four feet in all, is the only pipe about the engine.

By taking out the three bolts on each side, the two on the top and the two in the bottom flange, any cylinder may be drawn off for examination of piston, pitman or interior of crank case without disturbing any other part of the engine. By removing the two cap boxes on the transmission shaft the entire mechanism can be removed.

The base of the motor, to which the crank shaft is keyed, is a spider shaped bronze casting which, although light, has great strength and stiffness. This casting is secured to the chassis of the car by five studs. Every part of the motor and transmission is secured to this bronze casting, forming an integal, rigid power unit that may be removed and operated independent of any other part of the car.

The complete power plant, including all parts of the motor, transmission, oil tank and pump, carburetter, clutch operating cams, etc., all secured to the bronze supporting spider forming an integral power unit, weighs 387 pounds. Of this 157 pounds are the parts of the transmission which would not be needed if the motor was used for other purposes than that of automobile propulsion. Of the 230 pounds, the weight of the motor proper, 190 pounds in the cylinders, etc., forming the revolving unit or flywheel. All motor and transmission bearings are bronze with steel shafts, and the bearings are renewable.

The gasolene tank is made of heavy copper riveted and soldered. It has a partition in the centre with a stop cock communicating. With stop cock open both halves of the tank will be filled; if then shut off, warning will be given when half of the gasolene has been used that there is just enough gasolene left to get home on. A union stop cock is in either end; the tank is slung under the centre of the car by two heavy straps, and may be easily reversed should an accident cause one end to leak, or it may be removed if it it desired to store the car in a building where gasolene would not be allowed; it obviates the necessity of looking for clean cans in which to draw off gasolene.

Attention is called to the secure manner of fastening the body to the chassis. Six ½-inch Sweedes iron bolts being used, passing through metal bushed holes in the body so as to avoid shaking loose.

The under part of the car is entirely free of delicate mechanism which would be injured by running over brush, weeds, etc. The clearance under the centre of the car is 14 inches; the differential and chain, being on one side, comes over the path made by horses, and is 11½ inches from the ground.

All the novel features, such as revolving the cylinders around a vertical, stationary crank shaft, system of muffling, variable compression control, automatic spark regulator, control from front and rear seat, variable strength springs, carburetter, oiling system, etc., are the subjects of patents granted and pending in this and foreign countries.

The Adams Co. have one of the finest machine shops in the West, and are well positioned to make the most of their opportunities.

How Reputation Helps Sales.

That a reputation for reliability and probity has a distinct monetary value was demonstrated this week at the new Haynes-Apperson branch, on Broadway, this city. As related to a Motor World man by Manager Carrie, the story was this:

"We are only just beginning to be settled in our new quarters and to feel at home," he said. "There has been no time to seek business, so it is coming to us unsought. This morning a gentleman who was an entire stranger to us came in and asked some questions about Haynes cars. I showed him a tonneau that was on the floor, having just been uncrated. As he seemed to be interested, I suggested that we give him a demonstration. 'Oh, I guess it isn't necessary,' he replied. 'I have heard about Haynes cars and I imagine they are all right. Could you have this car ready to send out to me this afternoon?'

"That was pretty quick work, but I answered that we could. 'Very well, then,' he said. 'I'll write you a check if you will give me pen and ink,' and, leading the way to the office, he had the check for $2,550 ready before I could make out the bill.

"'Send it to me at Bernardsville, N. J., he said. 'I am Senator Childs, and I want to use it right off for electioneering purposes.'

"So we have been at work on it and it is now about ready," concluded Mr. Carrie.

Increasing the Locomobile Facilities.

In order to facilitate the construction of their high grade cars, the Locomobile Co. of America have recently installed a considerable quantity of special machinery. Important changes have been made in the drop forging department, new and improved tools having been added in order to take care of the increasing output. A few forgings of special character, requiring very large and heavy machinery, are made outside of the Locomobile factory. In these few cases, however, the parts are made from special material furnished by the Locomobile company in order that the work may be up to their usual high standard.

A number of new gear cutting machines have been added, doubling the capacity of work in this department. Some of the new machines make it possible to cut and plane absolutely theoretically corect bevel gears which run at high speed without noise. A quantity of automatic screw machines have been added, together with special machinery for boring cylinders and grinding valve seats.

The work on the 1905 models is progressing rapidly, and it is expected that the Locomobile output will be on the market three months sooner than it was last year.

When the Burner Clogs.

One of the petty annoyances that are sometimes encountered is that of a clogged burner in the acetylene headlight. The easiest way out of the difficulty is to carry a spare burner or two. Burners are inexpensive, and are easily removed or inserted.

MATERIAL FOR BEARINGS

Composition not the Chief Item of Importance—The Other Things That Count.

The importance of the material used in the various bearings of the automobile is attracting attention, but not the right kind of attention.

Too many manufacturers and users are depending entirely upon the chemical composition of the brass or bronze, or whatever it may be in the way of an alloy.

In order that a metal may be just right, it is quite true that the composition must be just right. More important than the composition, however, is the manner of melting and casting. There are many details in connection with this that affect the life of a brass or bronze vitally.

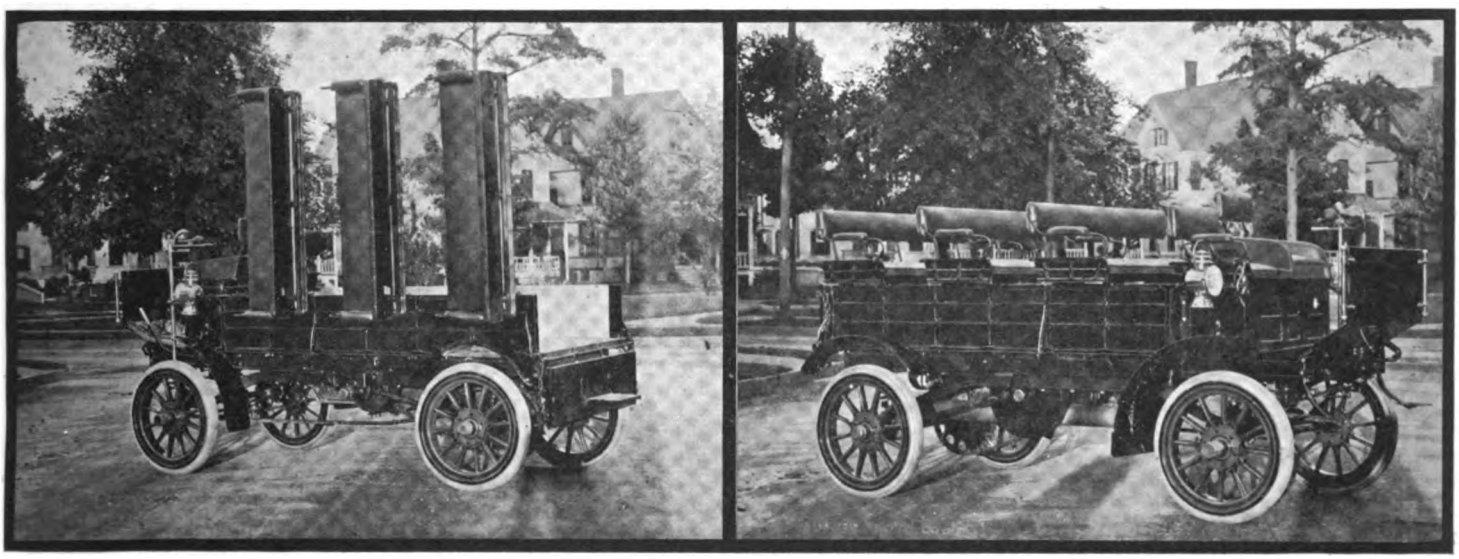
If the melter be careless and melt his materials in such a way that the air can get at it, or if he adds dirty materials that are full of oxides to start with, he cannot get a good sound casting; if the casting is not sound it will not wear well.

This is not as important, however, as another feature, which is that castings must be cooled in such a manner as to produce a fine, close grain. This must be cooled so quickly in one way or another that no one of the elements of an alloy may have time to separate, which it will do if the casting is the least bit slow in cooling. Further than this, the more slowly the casting cools, the larger will be the crystals. The larger the crystals, the less strength the metal will have. Strength means wearing quality, resistance to the pound of the explosion of the engine. Strength means a long lived bearing.

Therefore, in addition to specifying a certain composition when ordering, it is necessary to deal with good, reliable houses that understand the melting of alloys to the last detail—men who not only mix proportions carefully, but cast carefully.

On the other hand, many crank pin brasses and connecting rod brasses are blamed for failure not due in any way to the quality of the bearing. Some engines pound badly, and at the slightest provocation. In the hands of an ignorant or careless driver they pound more or less all the time. No connecting rod brass will stand this sort of punishment, even with extremely generous proportions, a small pressure per square inch, and all that.

The force of explosions in a gas engine cylinder is not greatly different from that of a gun, and it is easy to believe that brass can be battered by continually exploding a charge against it, in just the same way that the charge is exploded against the connecting rod and crank pin.



In short, there are some machines in which no kind of brass or bronze will wear well.

CAPACITY OF SPRINGS

Uncertainty That Often Exists—Importance of Calculating Loads Each Spring Must Carry.

Complaints as to the supposed carrying capacity of springs are frequent. Without doubt, their deficiencies can easily be traced. In many cases the grade of steel is not what it ought to be, and the supposed carrying capacity is not in the springs. Those experienced in the suspension of carriages and wagons generally agree that the straighter the spring the easier it works. But springs are cambered or are "open," so that the greatest possible load or down pressure shall not deflect the plates beyond the horizontal line. Hence the camber or opening must always be greater than the greatest deflection for the load they are intended to carry. There are three ways of increasing the flexibility of springs—by increasing the length, by decreasing the opening and by reducing the width and thickness of plates. These facts are well known to every carriage and wagon builder, but there seems to be a great deal of uncertainty as to the correct results arising from either change. Experience alone has taught those connected with this part of carriage and wagon building what the dimensions should be for a certain load. If conditions vary by changing the load from either of the front or back wheels, or by increase of weight in either direction, mistakes relative to its carrying capacity are likely to result, says the Carriage Monthly.

Take, for instance, springs on a brougham or cabriolet. Examine both of these carriages and the position of seats, and you will find that the weight is evenly divided between front and rear seat, or, in other words, the centre of gravity is between the two seats. Now take a coach or a landau,

THE KNOX COMBINED COMMERCIAL VEHICLE AND SIGHT-SEEING CAR.

Concerning Knox's Combination Car.

To their extending line of commercial vehicles the Knox Automobile Co., Springfield, Mass., have added the combination business and pleasure car shown by the accompanying illustrations. The first of the vehicles was delivered to the Anheuser-Busch Brewing Co., St. Louis. It has a capacity of 2,500 pounds, or 14 passengers; has a wheel base of 96 inches and tread of 56 inches; 3½ inch solid tires are used on 32 inch wheels. The motor dimensions are 5 by 7 inches. The car has a maximum speed of 18 miles per hour. The St. Louis brewers are using it for service in meeting rush orders and in taking sightseeing visitors to Mr. Busch's farm, the removable seats admirably adapting it to both purposes.

The Non-Pinchable Inner Tube.

In order to do away with pinching the inner tube an English rubber company has designed a tire in which the air chamber is vulcanized in an inverted U shape. It is made larger than the outer cover, and when inflated is under compression; therefore the walls are not thinned by stretching.

Digitized by Google

where the greatest weight is on front springs and front wheels. Again, examine the regular six-passenger 'bus, where one-third of the weight is on the front springs and wheels and two-thirds on the rear springs. Here is the difficulty for those who never have built such a 'bus. In the first place, they must calculate the difference in weight between front and back springs, and then order the springs for the intended weight each spring has to carry.

The main plates on all springs should always be of a heavier grade of steel, being backed by lighter or reduced grades. This strengthens the carrying capacity, improves elasticity and prevents to a greater extent the matter of fractures from collapse or recoil.

And Now the "Automobile Match."

The automobile has been the cause of a good many novelties in the matter of modified everyday objects, and the last, but not least, to undergo this metamorphosis is the household match! Realizing the difficulties attending the use of ordinary matches in a high wind, and the frequent absolute necessity for obtaining a light under such inclement conditions when motoring, a celebrated English firm of match makers have brought out a suitable and reliable form of match for use in such circumstances. These new matches are nearly five inches long from end to end, and have no less than one and one-half inches of inflammable matter at their business ends. Being of the "safety" variety, they "will only strike on the box," and a square of the igniting paper is stuck on one end of the matchbox for this purpose.

The flame given by one of these matches lasts for nearly half a minute, and will keep alight in strong winds. As the heads are securely attached to the stems, they do not easily fall off, but the stems themselves are not fired by the flame and are made long only for convenience in handling.

The Week's Patents.

772,419. Controlling Mechanism for Flash Boiler Systems. Hermann Lemp, Lynn, Mass., assignor, by mesne assignments, to General Electric Company, a Corporation of New York. Filed Oct. 2, 1902. Serial No. 125,668. (No model.)

Claim.—1. In combination, a boiler, a motor, a pump, and a single controlling device which regulates the motor and also the effective delivery of the pump together at certain times and only the pump at other times.

772,463. Motor Vehicle. William F. Kramer, Dayton, Ohio. Filed March 23, 1904. Serial No. 199,538. (No model.)

Claim.—1. In a motor vehicle, a running gear frame, a solid steering axle, a steering handle, means connected with said axle for turning the axle in either direction from the steering handle, and connections between the steering axle and the running gear frame permitting said axle to turn and permitting said axle and the running gear frame to rise or fall in passing over obstructions or depressions.

772,530. Carburetter for Gasolene Engines. Joseph A. McGee, Big Spring, Ind. Filed June 6, 1904. Serial No. 211,352. (No model.)

Claim.—1. In a device for the purposes specified, a rotating drum with perforated walls, an air conduit discharging into said drum and a nozzle discharging gas into the drum.

772,571. Electric Motor Vehicle. Hiram P. Maxim, Harry M. Pope and Herbert W. Alden, Hartford, Conn., assignors, by mesne assignments, to Morton Trust Company, trustee, a Corporation of New York. Filed Sept. 24, 1897. Serial No. 652,858. (No model.)

Claim.—1. In a motor vehicle, the combination with a battery, a motor and controller and electrical connections intermediate of the battery and motor and a handle for operating the controller, of a main line conductor for transmitting electrical energy from the battery to the controller, and a cut out, independent of the controller, comprising a bodily movable member constituting a current carrying portion of the circuit and readily removable to prevent transmission of energy between the battery and the controller.

772,590. Induction Coil. Richard Varley, Providence, R. I., assignor to Varley Duplex Magnet Company, a Corporation of New Jersey. Filed July 12, 1904. Serial No. 216,254. (No model.)

Claim.—1. The combination with the casing and vibrator of an induction coil, of a flexible cover fitting upon said casing and completely inclosing said vibrator.

2. The combination with the casing and vibrator of an induction coil and the adjusting screws for said vibrator, of a flexible elastic hood fitting upon said casing and completely inclosing said vibrator and screws.

772,591. Induction Coil. Richard Varley, Providence, R. I., assignor to Varley Duplex Magnet Company, a Corporation of New Jersey. Filed July 12, 1904. Serial No. 216,255. (No model.)

Claim.—1. The combination of a box or housing, an induction coil adapted to fit therein a group of contact plugs on one of said parts and a similar group of hollow contacts or terminals on the other of said parts, the hollow contacts being arranged to receive all of said plugs at the same time, as and for the purpose set forth.

772,592. Induction Coil. Richard Varley, Providence, R. I., assignor to Varley Duplex Magnet Company, a Corporation of New Jersey. Filed July 18, 1904. Serial No. 216,932. (No model.)

Claim.—1. In an induction coil, the combination of vibratile circuit controller, means for creating a pressure of the contacts thereof and means for relieving said pressure during the periods of energization of the coil.

772,625. Speed Indicating Apparatus. Fritz Montandon, La Chaux-de-Fonds, Switzerland. Filed Aug. 18, 1902. Serial No. 120,088. (No model.)

Claim.—1. A vehicle speed indicator comprising the combination of a part actuated relatively to the speed at which the vehicle is travelling, an indicating device associated therewith showing a definite distance traversed, and a stop watch or timepiece automatically set into operation and automatically arrested by the speed indicator actuating

mechanism and having the usual indicating devices and which shows the time occupied in traversing such definite distance.

772,636. Vehicle Tire. James A. Swinehart, Akron, Ohio. Filed May 13, 1904. Serial No. 207,802. (No model.)

Claim.—1. A tire for wheels comprising an elastic body solid throughout with concave sides and narrowed central portion and a convex tread surface with an enlarged rib centrally about the circumference of the tread.

772,649. Sparking igniter. Ernst Eisemann Stuttgart, Germany. Filed April 12, 1902. Serial No. 102,613. (No model.)

Claim.—1. An igniter for explosive engines and the like, comprising a current producer of high self-induction, a contact disk running synchronously therewith and in a short circuit with the same, an induction coil of which the primary coil is connected with the current producer and in circuit with the contact disk, and means for periodically opening the short circuit between the current producer and the contact disk, and causing the entire current to flow through the primary coil, the secondary coil being connected with sparking points; substantially as described.

772,673. Carburetter. Alvah C. Roebuck and Frank McMillan, Chicago, Ill. Filed December 7, 1903. Serial No. 184,035. (No model.)

Claim.—1. In a carburetter of the type herein described, the combination of a carburetter casing, closure heads for the ends of the same, an inner shell dividing the carburetter casing into an inner sub-chamber and an outer annular sub-chamber, a porous filling in said annular sub-chamber, an inlet neck connected to the inner sub-chamber, and an outlet neck connected to the annular sub-chamber, substantially as set forth.

772,812. Metallic vehicle wheel. Thomas Midgley, Columbus, Ohio, assignor to the Midgley Manufacturing Company, Columbus, Ohio, a corporation of Ohio. Filed August 21, 1903. Renewed April 13, 1904. Serial No. 203,034. (No model.)

Claim.—1. A metallic vehicle wheel rim, a tubular metallic spoke, and a metallic thimble at the outer end of the spoke and metallically joined thereto and to the rim.

772,813. Metallic vehicle wheel. Thomas Midgley, Columbus, Ohio, assignor to the Midgley Manufacturing Company, Columbus, Ohio, a corporation of Ohio. Filed August 21, 1903. Renewed April 13, 1904. Serial No. 203,035. (No model.)

Claim.—1. A metallic wheel hub composed of opposite disks having inner right angled flanges forming the spoke chamber, and outer flanges, and opposite hub-sections engaged by said outer flanges, and an axle-box within said disks and hub-sections, the said parts being metalically joined together.

772,814. Metallic wheel spoke. Thomas Midgley, Columbus, Ohio, assignor to the Midgley Manufacturing Company, Columbus, Ohio, a corporation of Ohio. Filed August 24, 1903. Renewed April 13, 1904. Serial No. 203,036. (No model.)

Claim.—1. A tubular metallic wheel spoke having a wedge shaped head, flat on two of its sides, and one of the inclined sides provided with a transverse depression having a wall between said flat sides of the spoke and forming the bottom of the depression.

772,856. Sparking plug for combustion engines. Charles H. Wisner, Flint, Mich., assignor to Peter P. G. Hall., jr. Filed July 24, 1902. Serial No. 116,766. (No model.)

Claim.—1. A sparking plug for combustion engines, provided with an outwardly extending passage opening into the cylinder, a second passage larger than the first passage forming an outward extension of the same, a raised shoulder on the surface of said plug between the ends of said passages, said shoulder surrounding the inner end of the first mentioned passage at a distance therefrom, a disk made up of one or more sheets of mica resting upon said shoulder, means for holding the mica, and an electrode secured to said disk and extending along said passage.

Popular Wedding Trip.

A popular wedding trip is to take a D. & C. steamer to Mackinac Island.

If you want a delightful wedding trip, where you are not likely to meet acquaintances, take one of the new D. & C. steel steamers to the island of cool breezes. Staterooms and parlors reserved 30 days in advance. Send 2c. for illustrated pamphlet.

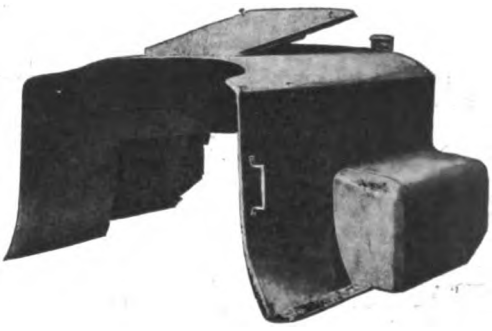
RADIATORS.

We want you to let us help you in experimenting for efficiency and design on radiators, hoods and fenders.



We have a number of new types of radiators, some quite novel and others merely rearrangements or refinements of last year's types.

In general we now produce a greater efficiency at a less price and weight than heretofore. The style and appearance are greatly improved, and on workmanship we are prepared to turn out the finest coppersmith work, amounting almost to jeweler's finish.

Our testing plant enables us to determine just the right radiation, yet without waste.

Manufacturers are generally aware that we have always been the unquestioned leaders in both quality and output in our respective lines, having made more of these parts, we believe, than all others put together. Don't expect mature results from amateurs.

Let us know your wants.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

Concerning Speed Changing

A great many motorists view speed changing with greater trepidation than any other operation connected with driving a car, and this often remains the case after they have become tolerably expert in its management. There is only one thing to do, and that is to work along as well as one is able, trying various methods of manipulation until the ones best suited to the driver are hit upon.

When one is able to handle the car well on the low gear, one may safely change into the next. Before changing gear the motor should be accelerated a little, the clutch withdrawn, and the gear lever moved to the second speed notch. Be careful, however, not to get past the notch. If there is a "latch" on the change speed lever, it will, of course, have to be first raised before the lever can be moved. It will facilitate changing gear to raise the latch and then move the lever until the latch clears the notch, when it may be released. The latch will then be in contact with the quadrant and ready to drop into the second speed notch when the lever reaches that position. The latch, by dropping into the notch, tells when the gears are in mesh. This method of changing is much easier than when one lifts the latch and holds it clear of the quadrant until the gears are thought to be meshed and then releases the latch, which may not find its notch until the lever is moved backwards and forwards one or more times.

In cars having the "gridiron" or Mercedes type of quadrant, care must be taken that the change gear lever is not moved into the wrong slot. In going "up," if a gear is skipped, say from first to third, it will not do so much damage as if a gear is skipped in changing from a high speed to a low, say, from fourth to second. In the latter case a great strain is imposed on the clutch and transmission, as the momentum of the car is utilized in turning the motor over at an extremely high speed, and may result in breaking a gear or twisting a shaft.

The beginner should practice changing gear until this can be accomplished without looking at the quadrant, as this takes his attention from the road in front. After a little practice he will be able to change gear as well in the dark as in daylight, "feeling" by the position of the lever the speed he is on.

About Bolted Springs.

It is a practice with nearly all manufacturers of fine carriages to bolt the springs at both top and bottom. Bolting the springs has a neater appearance, but the method weakens the parts considerably where the bolts are put. Take, for instance, a 1¼-inch wide plate bolted with ¼-inch bolts. This spring near the bolt is equal in strength only to a 1-inch wide spring. For vehicles which are only occasionally and carefully used, bolts will do. When built with the very best material they will stand its use well, but this is different in the case of vehicles which are in constant use. They should be clipped, top and bottom.

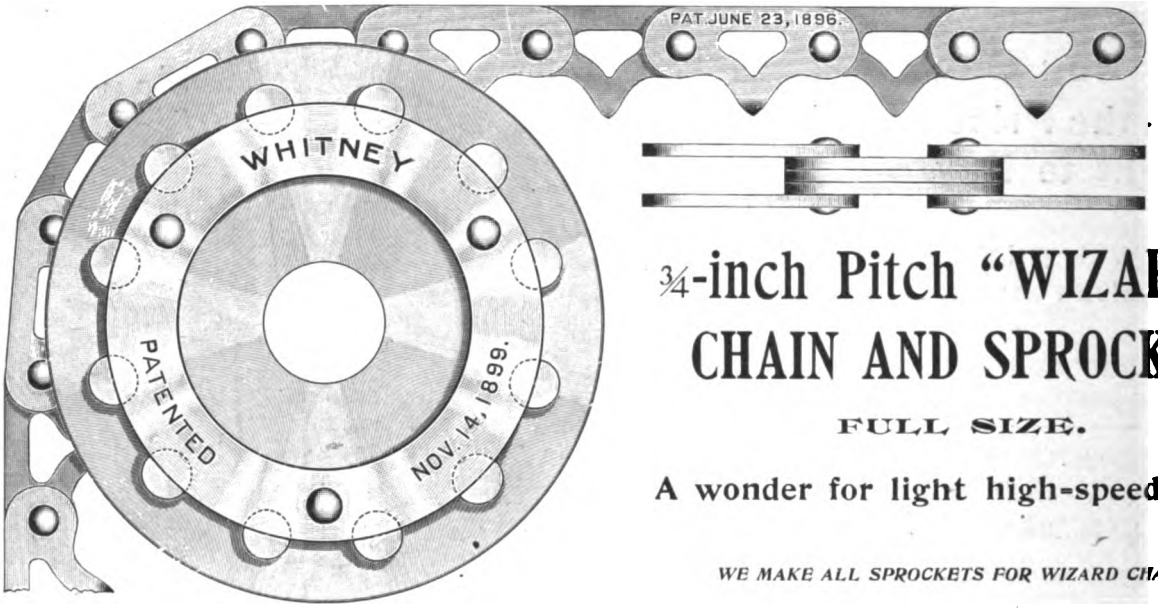
WHITLOCK COOLERS

For 1905.

Experiments are Expensive.

Sometimes they are not only expensive, but fatal. This is especially true in motor car construction. It is, therefore, always on the side of safety and good judgment to adopt those parts which have stood the test of time and have acquired for themselves a reputation based upon actual merit Price is not always the most important consideration.

Therefore, in deciding what cooler you will use for 1905, select one with a reputation.



The Whitlock Cooler has stood the test of time. It has been used for two seasons by the majority of American builders of touring cars. Our experience in this line is now unequalled. Write us about your cooler proposition.

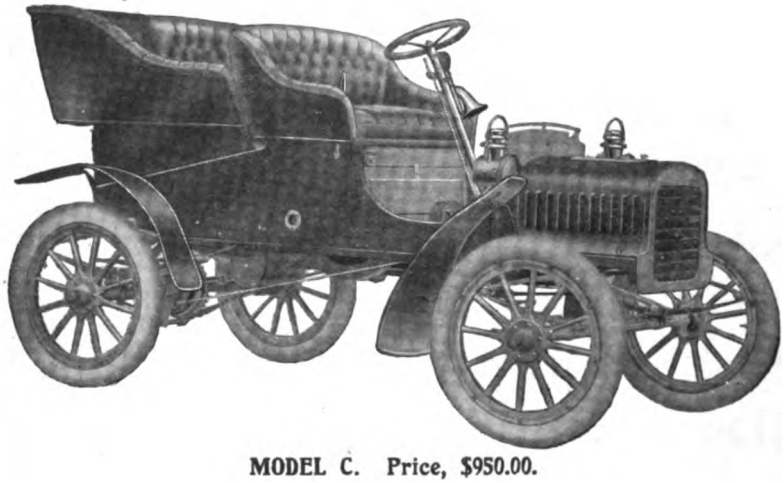
The FORD 1905 Cars



MODEL B. Price, $2000.00.

HENRY FORD'S LATEST AND GREATEST SUCCESS.

Our 1905 Touring Car weighs only 1710 lbs. The 4-cylinder vertical motor develops over 20 horse power, SO THAT THIS CAR HAS MORE POWER FOR ITS WEIGHT THAN ANY CAR IN THE WORLD. This means considerably less wear on the tires and consequently a great saving to the owner. It also means there is ample reserve power for steep grades and sandy roads.

Wheel base, 92 inches; direct drive, with universal coupling; cylinders, 4 x 5, water cooled; automatic oiling device with force feed; large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car place this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horse power, planetary transmission, chain drive, and increased gasoline capacity. The most stylish, low-priced car on the market.

SOME GOOD TERRITORY YET FOR LIVE AGENTS. Write us To-day for Full Information.

Less than One-Half of One Cent per Mile for Repairs.

Detroit, Mich., Sept. 2, 1904.

CADILLAC AUTOMOBILE CO.,
Detroit, Mich.

Gentlemen: On the 25th of April, 1903, I purchased through your sales agent, Wm. E. Metzger, Cadillac No. 183, which I think was one of the first machin s you manufactured. Since that time I have driven it something over 14,000 miles, and my repair bill in that time has been a little less than $60.00.

I want to thank you for the courteous way in which you have always treated me, and if your model D machine is as good as the Model A, you can consider my order placed now.

Very truly yours, (Signed) ARTHUR A. PALMER,
Adrian, Mich.

A good Operator can run a CADILLAC several seasons at small cost for repairs if he will take the proper care of his machine. The exclusive selling right for the CADILLAC line for 1905 may be open for your vicinity. Do you want it?

DAD SAYS THE FELLOW WHO TRIES MORGAN & WRIGHT CLINCHER TIRES AFTER HE'S TRIED OTHER KINDS ALWAYS WISHES TO GOODNESS HE'D TRIED THEM FIRST

W. G. LLOYD COMPANY,
Chicago.

MORGAN & WRIGHT,
Chicago.

Gentlemen: I want to give my experience as to the good qualities of your automobile tires. I believe you have all competitors beaten as to good service. Up to four weeks ago I had two kinds of tires on my Peerless, two———— and two ————, and I wanted to decide for myself which of these two would give the best service.

Four weeks ago I ordered from the Cadillac Automobile Company, in which I am interested, another ———— 34 x 3½. Mr. Howard Hoops suggested to me to try a Morgan & Wright, which I did. I can safely say that it is the best tire out, as I gave it a good test on a four-day trip to Milwaukee, Waukesha and Geneva. I also went down to South Bend to meet the Eastern delegation to St. Louis. In fact, the machine has been on the streets every day, and the Morgan & Wright tire looks just as good as the day I put it on, and it is the only one of the four I did not have any trouble with.

I have recommended same to a number of people of the club and others.

Yours very truly,
W. G. LLOYD.

MORGAN & WRIGHT,
CHICAGO.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

PREMIER
AIR-COOLED

DIRECT RADIATION.

5,500 miles in a Premier air-cooled car during 1904 with a total of $23.00 repairs is the record of a well satisfied customer. "There is a reason for most things uncommon."

Expert drivers do not find much trouble in figuring out *why* Premier cars will do more mileage than other cars and at less cost for maintenance. Premier details are complete, Premier quality absolute, Premier methods of construction and operation *perfect.*

1905 Cars Now Ready for Delivery.

A few additional first class agents wanted in unoccupied territory.

WINTON

If you will send name and address, we will forward by immediate return mail our booklet No. 3, describing in detail the 1905 products of the house of Winton.

There are four models—all with four vertical cylinders, magneto ignition, positive and efficient automatic lubrication, every working part instantly accessible, new spring suspension assuring uniform resistance and resilience under varying conditions of load and road, side entrance tonneau, and spacious lockers for luggage and equipment.

Power of motors in the several models ranges from 16 to 40 H.P. Prices range from $1800 to $4500.

The $4500 car is our superb 40 H.P. chassis, mounting a special limousine body.

The price of the 40 H.P. chassis, with regular touring car body is $3500.

For $2500 we offer our 24 H.P. touring car (Model B.)

And, our 16 H.P., (Model C)—price $1800, weight 1,800 lbs., fully equipped, side entrance tonneau, and of quality throughout equal to our higher priced models—is, by far, the greatest value every placed upon the market.

If you are interested in automobiles, you should learn all about the 1905 products of the house of Winton.

THE 1905 LINE OF SOLAR LAMPS

is now ready for inspection.

That they represent the acme of lamp perfection for Autos, Motor Cycles and Bicycles, no driver or rider who has ever used Solars can doubt.

Years of satisfactory service resulting from careful, honest manufacture, have placed Solars preeminently in the lead.

Manufacturers cannot afford to overlook these facts, for poor lamps will frequently result in condemnation of the whole machine.

Our New 1905 Generator means

NO LAMP TROUBLES

1905 samples and prices now ready. Write to us for all information.

WHO'S AFRAID? MY DAD SAYS A FELLOW CAN TACKLE ANY KIND OF ROADS WITH MORGAN & WRIGHT CLINCHER TIRES

DUNCAN R. DORRIS,
Nashville, Tenn.

MORGAN & WRIGHT,
Chicago, Ill.

Gentlemen: St. Louis Motor Car, St. Louis Tour. No. 127, A. A. A. Certificate awarded, reached Nashville on the return trip Wednesday afternoon. The round trip was nearly 700 miles, traveling for more than 100 miles through a strip of Kentucky in which there had never been an automobile. This car has the distinction of being the only local car which ever got 300 miles away from Nashville and came home under its own power. Wonderful to relate, the round trip was made without a breakdown of any kind in the machinery and without a single puncture or other tire trouble. To the stay-at-homes this may not seem noteworthy, but to those who have tackled Kentucky and Southern Illinois roads it is little short of marvelous. Pioneering through Kentucky, almost everything in the line of roads was tackled. The flywheel guard was twice carried away by being struck by rocks, once the car stuck in the middle of a deep stream that had to be forded, twice the car was stuck in the sand on the Kentucky side of the Shawneetown Ferry, and once in the mud on the Illinois side. The 700-mile trip was made in slightly less than seven days.

It will be of interest to you to know that Morgan & Wright tires were used on this trip, and the wonderful lack of trouble was most gratifying. We wish "Good Tires" long life and prosperity.

Very truly, DUNCAN R. DORRIS.

Pope-Toledo,
Driven by George Fuller:
1 mile, 1:00 3-5

WORLD'S RECORD
AMERICAN TOURING CAR,
STRIPPED:
Peerless,
Driven by Barney Oldfield:
10 miles, 10:50 1-5

WORLD'S AMATEUR RECORD:
Frank A. Garbutt, in special car:
1 mile, 0:58 2-5

WORLD'S RECORD, 10 MILES:
Peerless Green Dragon,
Driven by Barney Oldfield:
9 min. 17 1-5 sec.

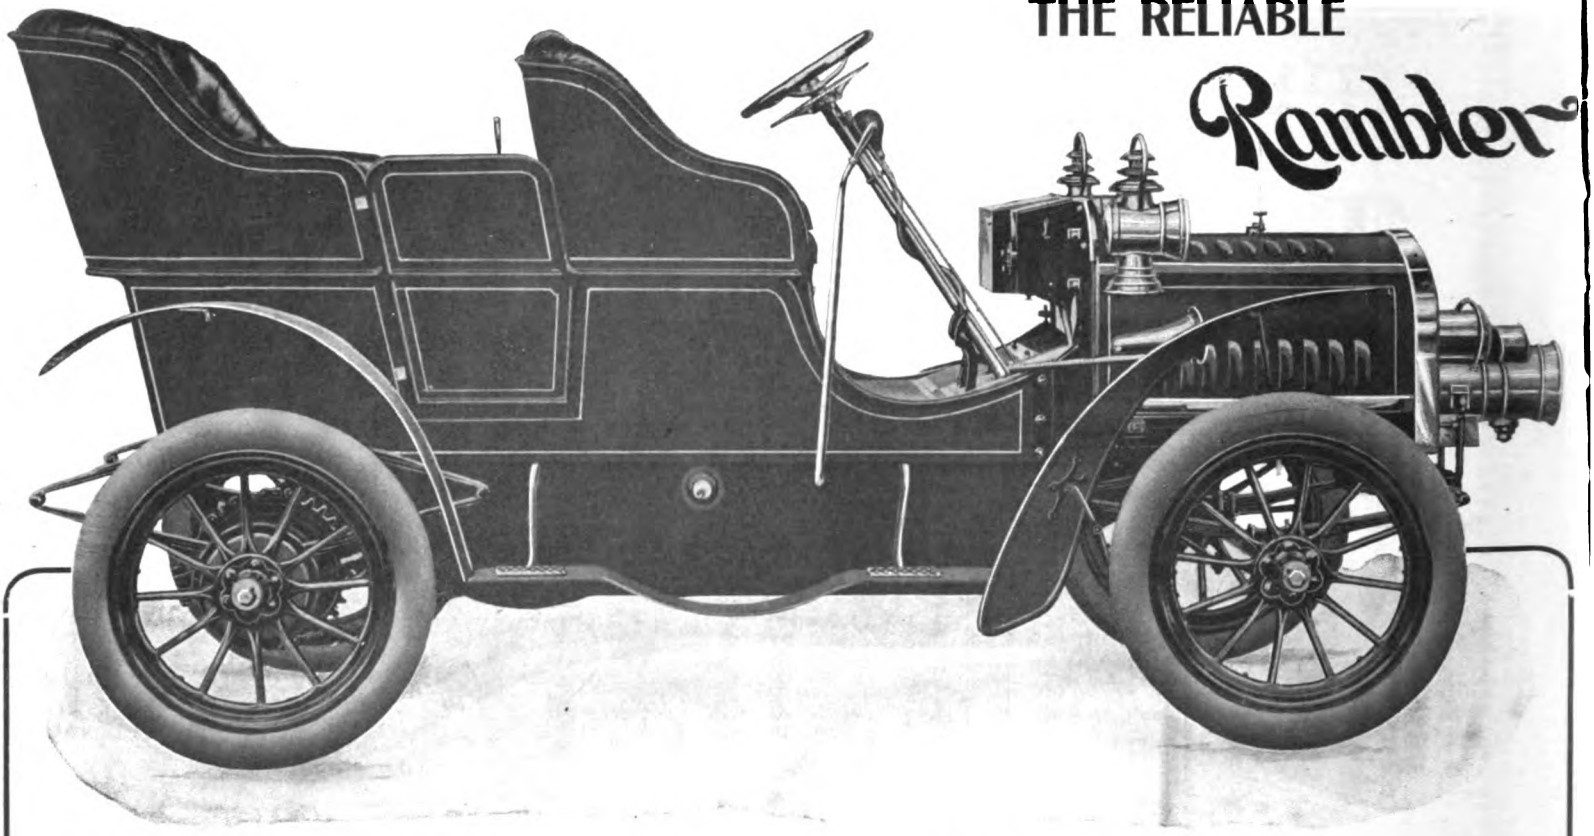
G & J Thread Fabric Tires were used on the 24 H. P. Pope-Toledo car driven by Mr. Lytle in the Vanderbilt race, winning third place, finishing ahead of all other American cars. In the course of the race one of the tires punctured; the other three tires went through the race without mishap or trouble of any sort. The tires at the finish of the race were not only in perfectly good condition, but were

ENTIRELY FREE FROM HEAT

The tires could not have been cooler or in better general condition if they had been driven but one mile at an ordinary pace, instead of 300 miles at a terrific speed.

Two punctures occurred in the tires on the 60 H. P. Pope-Toledo driven by Mr. Webb. No weakness of any kind developed in the tires.

It is not surprising that punctures occurred (and practically every contestant suffered punctures), as the road in the Hempstead Control was strewn with new tacks, nails and broken glass.



G & J THREAD FABRIC TIRES NOT ONLY FAST, BUT DURABLE AS WELL.

THE RELIABLE

Rambler

Surrey, Type One. 1905 Model.

Two Cylinders. 16 H. P. Immediate Delivery. $1350.

In the race at Rockford, Illinois, October 8th, a RAMBLER, 1904 model, with two cylinders, won a mile race from a 1905 model of another make with four cylinders and nearly twice the rated power.

Time, 1:17 2-5 vs. 1:19.

RAMBLER'S rated power.

Other car's rated power.

RAMBLER'S cost.

Other car's cost,

and yet the RAMBLER is not designed for speed, but for practical work—for use on rough roads and hills.

The working idea of the RAMBLER factory is simplicity—the putting together of mechanism that any one with good sense can manipulate. This at the lowest price consistent with good workmanship—a price much lower than other manufacturers', because of our enormous output, which makes possible a great buying power and the employment of each man and each machine for one detail only.

Let us tell you more about how the RAMBLER is built—and enjoyed.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, November 10, 1904. No. 7

KNOX GOES INTO TRUCKS

Heads a New Company That Promptly Gives Evidence That it "Means Business."

Harry A. Knox will not be so long out of harness as he anticipated would be the case when he severed his connection with the Knox Automobile Co. Although he was said to have planned an extended vacation, he has, instead, plunged into the Knox Motor Truck Co., which has been organized at Springfield, Mass., with Mr. Knox as its president and general manager. His associates will be Walter S. Pease, vice-president and superintendent, and Clarence J. Wetsel, treasurer.

The company will be a Massachusetts corporation with $100,000 capital. That it "means business" is indicated by its purchase of some 60,000 square feet of land on the corner of Beckel and Hooker streets, Springfield, for the immediate erection of a large plant. Plans are complete for a factory covering over 75,000 square feet of floor space, with a railroad frontage of about 350 feet. This property is considered to be one of the finest factory sites in Springfield. The plans call for a factory equipped with machinery of the latest type, the aim being the best equipped factory for the manufacture of commercial motor cars in this country..

Ground will be broken at once, and contracts call for the erection and complete equipment of the plant by March 1, 1905. In the interval arrangements have been made with the Baush Machine Tool Company (of which Mr. Wetsel is treasurer and manager), whereby a part of their plant has been placed at the disposal of the Knox Motor Truck Company for the immediate manufacture of their product.

Absorbs Grossman's Business.

The recently organized Motor Car Equipment Co., New York, has taken over the accessory business of Emil Grossman, which will be continued at 43 Cortlandt street. Grossman still retains an interest, being president of the new concern. Carl Kaufman, who was formerly connected with the Manhattan Storage Co., is secretary and treasurer and will be the active manager.

Buick Reorganizes and Adds Capital.

An entire reorganization of the Buick Motor Co., of Flint, Mich., took place last week, which will result in placing the concern in a position to prosecute an aggressive policy. The capital stock was increased from $75,000 to $300,000, the latter being subscribed in full.

The reorganization means a community of interests for the manufacture of automobiles, in which the Durant-Dort industries, the Flint Wagon Works Co. and the Buick Co. will be mutually concerned.

In the reorganization Charles M. Begole succeeds James H. Whiting as president; W. S. Bellenger, secretary of the Flint Wagon Works, becomes secretary of the motor company, and W. H. Whiting and William C. Durant were added to the board of directors. The company has leased the buildings of the Jackson Purifier Co. at Jackson, and will operate two establishments, one at Flint and the other at Jackson.

Parker Goes With Haynes.

Robert P. Parker, formerly manager of the New York branch of the Hartford Rubber Works, has just succeeded F. G. Carrie as manager of the New York branch of the Haynes-Apperson Co., of Kokomo, Ind. Mr. Carrie returns to his first love, the soda fountain business. In Mr. Parker the Haynes-Apperson Co. has secured an able and agreeable man, and with the new car there is every reason why the Haynes interests should be materially advanced in this vicinity.

Briscoe to Establish Eastern Plant.

The Briscoe Mfg. Co., Detroit, the well known makers of radiators, hoods, tanks, etc., have increased their capital stock from $250,000 to $310,000, which move is preliminary to the establishment of a plant in the East. This Eastern factory will be located in the vicinity of New York.

Thomas's Body is Now Protected.

On Tuesday last, the patent covering the design of the body used on the 1905 Thomas touring car was issued to E. R. Thomas and Jas. R. Koen, of Buffalo. There is said to be in existence but one other patent on automobile bodies.

HAYNES HAS A NEW CAR

Veteran Concern Departs Radically from Previous Standards—Will Employ Roller Gears.

When it makes its appearance on the market it is reasonably certain that the new car which the Haynes-Apperson Co., Kokomo, Ind., will "launch" early next month will create something of a stir.

This addition to the line will depart radically from previous Hayneses in that it will employ not only a vertical four-cylinder engine instead of the double-opposed motor which has hitherto characterized the product of the veteran company, but shaft drive will be substituted for the chain; and in place of bevel gears the shaft will be actuated by a roller gear, which is the invention of President Elwood Haynes himself, and for which a patent is pending. The body design will, of course, be of the side entrance type, and in outline and general appearance it compares favorably with anything yet produced.

A Motor World man who was privileged to ride in the new car at the factory found it characterized by ample reserve power, very flexible control and a sweetness and noiselessness of operation that was marked.

To Handle Peerlesses in New York.

As was intimated in these columns a few weeks ago, a Peerless branch will shortly be established in this city. The Peerless Motor Car Co. of New York has been formed for this purpose, with the following officers: L. H. Kittridge, president; C. G. Wridgway, vice-president; C. E. Anderson, secretary and treasurer. The management of the branch will devolve on C. G. Wridgway, who has for several years served in a similar capacity with the Bankers Bros. Co., in this city, and is a well known figure in the Metropolitan trade.

The branch will be spacious and equipped especially as an automobile salesroom and garage. It is now being erected at 220 and 222 West Forty-first Street, just west of Seventh Avenue. There will be a total floor space of 12,000 feet, which will be divided into a salesroom, storage room and repair shop. The establishment is expected to be ready for occupancy by December 15.

WINTON LIFTS THE VEIL

Discloses the Details of His Reconstructed Line—Variable Springs a Novel Feature.

While the bare announcement of the new Winton line was startling enough, the revolutionary character of the big Cleveland concern's new policy is best understood by an examination of the principal features of the cars themselves. These furnish considerable food for thought. They reveal the wide departure from previous models that has been made, as well as the time tried and tested devices that have proved conspicuously successful in earlier Wintons, and on that account retained in the new ones.

Of the four entirely distinct models that will constitute the 1905 line, two are rated at 40 horsepower, viz.: the Model A Special and the Model A, while of the others, one—the Model B—is rated at 24 horsepower, and the other—the Model C—at 16 horsepower. The prices are $4,500, $3,500, $2,500 and $1,500, respectively, as was stated last week.

In each model the four cylinder vertical motor, water cooled and placed under a bonnet, has the cylinders cast in pairs, the heads, water jackets and exhaust valve chambers being integral therewith. The crank shaft, connecting rods and pistons are instantly removable by detaching one side of the aluminum crank case, which is split vertically. This process leaves the cylinders in place on the case and does not disturb the water tubes, carburetter tubes or any of the other motor accessories. All cam shaft gears are inclosed. A dustpan is placed under the motor and is a permanent fixture. Since all work of inspection, adjustment and replacement can be accomplished from above, it is never necessary to get beneath the motor.

While retaining, with some slight changes in detail, the well known Winton system of individual clutches, an otherwise entirely new transmission has been adopted. Instead of the usual Winton central driving chain, a propeller shaft and bevel gear drive is employed, which is claimed to withstand the effects of inexperienced or careless operation and escape without breakage. All clutches consist of one cone and one flat-faced member, acting upon a bronze member. The universal joints on the shaft are inclosed, and the drive is direct on the high gear. There is a flexible coupling between the transmission and the motor, and the transmission is directly accessible under the forward footboard. The dust and oil proof transmission case cover is instantly removable to afford inspection or adjustment.

The rear axle is steel, with a spur differential, and is equipped throughout with special roller bearings. The wheels are keyed to the axle, and a single ball joint strut limits the axle movement and absorbs all braking and driving strains. The single expansion chamber of ample proportions produces a practically noiseless exhaust. This muffler construction insures against back pressure and loss of power.

The Winton air governor has also been retained and gives to the motor an innumerable variety of speeds. The pressure from the air pump acts on the inlet valve plungers and regulates the quantity of mixture admitted to the cylinders. The cars are governed for either constant or variable pressure, at driver's choice, by a lever above the steering wheel or a spring button under the right foot. Two levers and one brake pedal control all transmission clutches and brakes.

One of the most important of the features presented by the new Winton construction is the perfected system of ignition, which banishes dry batteries, accumulators and the ever-bothersome vibrator spark coils. In place of all these troublesome complications and sources of expense, a recently developed and reliably efficient magneto is used, which is direct connected and driven by a positive gear. In this manner of gear connection the possibility of irregular and intermittent ignition is obviated. Instead of the multiple vibrator coils, but a single non-vibrator coil, which is most durable and very simple in construction, is needed. Tests of the severest and most exacting nature have positively demonstrated the high efficiency, economy and thorough practicability of this system of ignition. The spark advance lever is attached to the steering column on top of the wheel.

A single water-jacketed carburetter, placed close to the motor, supplies all cylinders. The gasolene is pressure fed from main tank to auxiliary tank, and thence gravity fed to the carburetter float chamber. The auxiliary tank is immediately above the carburetter.

The system of lubrication is claimed to effectually solve all lubrication difficulties. A roller feed lubricator, having no springs or valves to get out of adjustment and cause trouble, worry and expense, is employed. This gives constant feed in any temperature, with light or heavy oil. There is no pressure, and the oil is fed in exact proportion to the motor speed. All motor and rear axle bearings are lubricated from the same lubricator.

The engine is cooled by water circulation effected by a gear-driven centrifugal pump. The rapid and efficient circulation of water is positive with the starting of the motor. The radiator is of ample proportions, consisting of vertical tubes, with radiating fins. A direct connected and gear driven fan insures constant suction from the back of the radiator, while a secondary suction fan is cast in the flywheel. This system of double suction insures an air circulation of volume sufficient to cool the motor under all the varying conditions of operation. An air tight casing back of and encircling the bonnet fan assures a maximum volume of suction through the radiator.

The frame is constructed with side members of one-piece channel section pressed steel. There is no sub-frame. The motor and transmission are carried on malleable drop frames.

Three band brakes are fitted—one on the drive shaft, operated by a forward movement of the high gear lever; the other two on the driving wheel links, operated by a pedal.

Remarkable claims are made for the entirely new system of springing employed on the 1905 Wintons. By it light springs for light loads and heavy springs for heavy loads are assured. A double spring of six leaves is so shackled that only three leaves are engaged when one or two passengers are carried, whereas six leaves are engaged as the load increases.

All four models are standard gauge—4 feet 8½ inches. The wheel base of the Model A Special and Model A is 9 feet; of the Model B, 8 feet 8 inches; of the Model C, 7 feet 6 inches. The cylinders of the Model A are 5¼-inch bore by 6-inch stroke, and the tires 34x4½; of the Model B, 4⅜-inch bore and 5-inch stroke, with 32x4-inch tires; and of the Model C, 3½-inch bore and 5-inch stroke, with 30x3½-inch tires.

The Week's Incorporations.

New York, N. Y.—The Chrono-Velocimeter Co., under New York laws, with $25,000 capital; to make automobile attachments. Directors—Junius Howe, E. O. Towne, Sara J. Towne, New York.

Chicago, Ill.—William Herrick Co., under Illinois laws, with $50,000 capital, to manufacture automobiles and parts of same. Incorporators—William Herrick, Frank E. Drake and Robert Pringle.

Washington, D. C.—Narragansett Motor Co., under District of Columbia laws, with $25,000 capital. Incorporators—H. G. Sheeler, W. S. Clinton, P. H. Kennedy, Isaac Wynne and W. A. Swan.

Tacoma, Wash.—Washington Automobile Co., under Washington laws, with $10,000 capital, to manufacture, sell and rent automobiles and auto boats. Incorporators—F. L. Stiles, D. A. Young and Harry Hurley.

Jersey City, N. J.—Standard Storage Battery Co., under New Jersey laws, with $500,000 capital, to manufacture and deal in electric storage batteries. Incorporators—Louis B. Dailey, H. O. Coughlan and P. Stafford Moritz, Jersey City.

Additions to Retail Trade.

R. G. Carpenter, Houghton, Mich., has added an automobile department. He will handle the Olds line.

William Groth, Appleton, Wis., will add an automobile department to his business. He has arranged to handle the Olds line.

The East Coast Automobile Company is the title of a new concern organized at Jacksonville, Fla. A store at the corner of Ocean and Forsyth streets is being fitted up for it.

De Loura Discontinues Automobiles.

It was voted last week by the stockholders of the De Loura Automobile Mfg. Co., of Ft. Dodge, Iowa, to change the name to Iowa Founders and Mfg. Co. The manufacture of automobiles will be discontinued. H. D. De Loura, who organized the company, has sold his stock, and will go to the Pacific Coast.

OLDS ALTERS POLICY

No More Big Territory for Agents—How Size of Shipments will Govern.

While not exactly radical, the Olds Motor Works will henceforth pursue an altered policy in marketing their product. Instead of allotting territory to a comparatively few dealers with power to appoint sub-agents, the Olds aim will be to, as far as possible, deal direct with all agents, both great and small. The limit to which they will go in this direction, however, will be measured by the size of the dealer's order. They will ship Oldsmobiles only in carload lots, and the agent who is not big enough to handle such quantities must perforce be content to be a sub-agent and draw his supply from the larger agent in his particular vicinity.

This information was imparted by R. D. Chapin, sales manager of the Olds Motor Works, who was in New York last week. This change of policy will, of course, affect a number of territorial agents, among them the Oldsmobile Co. of New England, which hitherto has controlled the New England States. Under the new arrangement, its range of action will be limited to Boston and vicinity, a factory representative, C. H. Larson, having been delegated to appoint agents in the outside territory.

"In order to be fully prepared for the rush of business that is expected next spring, both the Detroit and Lansing plants have been working full force for some time," said Mr. Chapin in discussing the outlook for next year. "We will have two thousand new cars ready for shipment on the 1st of next March. We will be better prepared to take care of our agents than ever before, and hope that we have so planned things that no sales will be lost to Oldsmobile representatives through inability to get the machines as fast as they want them.

"No heavy, expensive cars will be built by our factories, but we will have the largest line of light machines of any factory in this country. There will be two new models for next season, and some announcement will be made concerning one of them inside of the next two weeks. Our line for 1905 is really a very interesting one from the standpoint of the dealer. In fact, the travelling men who are out on the road report to us that the only trouble we are likely to have next season will be to make deliveries.

"It is not probable that a New York branch house will be established when the contract with our present representatives expires at the end of the year. The only branch houses we now have are those at Detroit and Boston, and it is against the policy of the company to open any more. We would rather have an agency in this city, if the proper representation can be secured, and some arrangement is expected within three or four weeks. There will be a few changes in our representation for the coming season, but not many.

Brampton's Bid for American Favor.

Hereafter the well known Brampton chains will be made in four standard American sizes, viz., 1-inch pitch by ⅜-inch, with 9-16-inch roller; 1-inch pitch by ½-inch with 9-16-inch roller; 1-inch pitch by ½-inch with ⅝-inch roller, and 1¼-inch pitch by ½-inch with ⅝-inch roller. The 1904 Winton and Olds cars were equipped with Brampton chains which were made specially for those machines. Heretofore the Brampton chains were made only according to the metric system of measurement and would fit only the foreign cars. Charles E. Miller, No. 97 Reade street, New York City, who is the sole American agent, received samples of the new sizes on Wednesday.

Reo Will Have New Gearing.

Details of the production of the new Reo Motor Co. are leaking out by degrees. It is now known that the price of the 16 horse-power 1,400-pound touring car which, in addition to a runabout, will be marketed, will be $1,250, and that it will incorporate an innovation in the matter of transmission gearing. If the weather is favorable it is hoped to have the first of these cars to make the journey by road from the factory at Lansing, Mich., to New York. R. M. Owen, sales manager of the company, is now at Lansing, and hopes to be able to effect the necessary arrangements.

Sues Flagler for Large Sum.

In the United States Circuit Court, this city, last week, William McCay, of Pasadena, Cal., sued John H. Flagler for $212,500. He alleged that in May, 1900, he agree to turn over to the American Motor Company the Monitor Vapor and Engine Company, for $76,785, in cash and stock of the American Motor Company, and that Flagler was to buy $75,000 of the Motor stock.

The plaintiff alleges that he discharged his part of the contract, but that the defendant failed to do so.

Pope Men to go to Paris.

The Pope Motor Car Co.'s exhibit at the Paris show will be in charge of H. A. Leinhard, manager of the Pope foreign department, and Harold L. Pope, who has had a deal to do with the development of the Pope-Hartford car. They will leave for Paris on the 22d inst. H. H. Lyttle, who will demonstrate the cars, is already on the ground.

Wichita Will Have More Room.

Work has been commenced on a $14,000 building at Wichita, Kan., the entire ground floor of which will be occupied by the Wichita Automobile Co. The building has a length of 150 feet and width of 50 feet, facing on Lawrence avenue. The space will be divided into a salesroom and repair shop.

Huff Goes to Kokomo.

The E. S. Huff Co., makers of spark coils, have removed to Kokomo, Ind.; they formerly were located in Detroit.

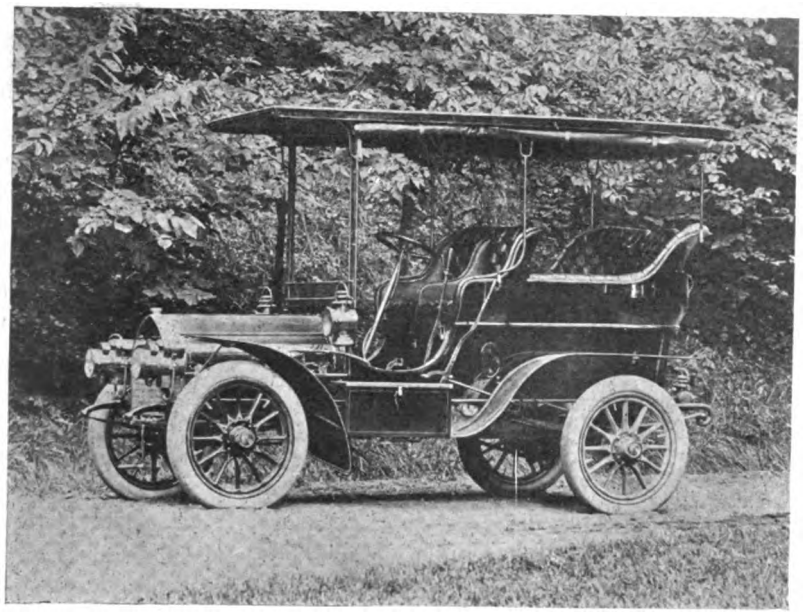
RETARDING THE ELECTRIC

How Refusal to Recognize Conditions Results in Loss of Sales and Patronage.

That trade in electric vehicles is almost wholly dependent on the presence or absence of charging stations is the view that is taken by Henry Goodman, who is the travelling representative of the Pope Motor Car Co.'s Waverley department in this city. The fact has been known in a general way, but it was not supposed that the law of supply and demand operated with such absolute disregard of other conditions.

"Wherever there exist facilities for charging, there business in electric vehicles is or can be done," said Goodman to a Motor World man one day this week. "On the other hand, no business can be done where there are no charging stations.

"As an example of the influence that ample facilities for charging and a moderate cost exerts on sales, I will cite Rockford, Ill. That is a little town of about twelve thousand inhabitants, and there are fifty electric vehicles in use there. The facilities for charging are all that can be desired, and the charge for current is only five cents per kilowatt. This makes the electric a splendid proposition in the town, as is shown by the number of cars there.



"Down on Long Island, where I have been travelling during the last week or two, a very different state of affairs exists. There are plenty of people who want electrics, and it would be an easy matter to secure orders if there was only some way of charging, and at reasonable rates. But the charging stations are few and far between and the prices asked for current are exorbitant. In Far Rockaway, for instance, they ask 18 cents per kilowatt, and there are some places where they charge as high as 20 cents.

"The charge for current should never exceed 10 cents per kilowatt. Here in New York the usual charge is five cents, and from that up to eight cents is the usual price in places where much charging is done.

"Why don't the electric light or power companies make a bid for business of this kind? Well, for a variety of reasons. Sometimes it is indifference or lack of enterprise. Again, it is because the companies make only enough current for their own uses. Or, they run their power houses only at night, and when a man comes along and wants some current, they don't care to start their engines for such a little job.

"The remedy is to either bring about a change in the attitude of the light and power companies, or to have the tradesmen in the towns put in charging plants of their own. The latter is, perhaps, the easier plan. Certainly it presents the fewer obstacles. A dealer or garage keeper can put in a plant for $1,000 that will take care of any business he is likely to get for a long time. By installing such a plant he is pretty certain to get all the electric business he can handle, and if he is a dealer also he can build up a good trade in electric vehicles."

The Struggling Amateur Spirit.

Although the American Automobile Association holds no recognition of or for it, signs are not wanting that the spirit of amateurism is struggling to make itself heard or felt in the realm of automobile sport.

We are given to understand that Messrs. Frank Croker, William Wallace, H. L. Bowden and other gentlemen of means who maintain racing "stables" and on occasion drive their own cars, are among those who would welcome the drawing of a line of distinction between those who race for sport's sake and those who make a business of the sport or the hired men who race because their employers order them to race.

Whether the greasy blue "jumpers" affected by Mr. Alfred G. Vanderbilt's "man" or the shirt sleeves and suspenders attire worn by other racers for revenue only has had anything to do with causing the amateur spirit to shift uneasily, is an interesting speculation. But, as Mr. Wallace himself is a member of the A. A. A. racing committee, it is evident that if the spirit really and truly moves him, he should have small trouble in giving it definite shape and purpose.

The revival of the subject revives also all the arguments which the Motor World presented during its campaign for an amateur definition at the time the A. A. A. was formulating its racing rules two years ago. The arguments are as sound to-day as they were at that time, and if anything the present situation simply adds strength to them.

"Cash vs. Plate" was then the popular style of the discussion, and it is a matter of record that a man of such affluence and influence as Mr. Albert C. Bostwick indignantly spurned the suggestion of littering his household with the baubles encompassed by the term "plate"; it was pointed out that automobile racing was such an expensive sport that even rich men welcomed the cash prizes as means of reducing the cost of indulgence. We also had held up to us the pigeon shooters and other true blue "sportsmen" who accept cash without soiling the sanctity of their particular sport or without offending the spirit of amateurism. These contentions, assisted by foreign precedent, prevailed.

It was inevitable that a revulsion of feeling or sentiment should ensue. The men who make a business of sport and who race for the money there is in it, and those who race because of the love of sport, are not and never were of a class, and cannot compete on an equality. They have little in common. It is a violation of decency and of the fundamental spirit of sport that they should be herded together and marked with the same brand. It is high time that the sheep and the goats were separated, and if Mr. William Wallace is correctly quoted and has the courage of his convictions, he is splendidly positioned to play the part of shepherd. Will he do so?

Tires and Their Protection.

One of the interesting features of present-day motoring is the increased use of tire protectors. That there is an increase can scarcely be doubted. It is only necessary to notice the number of cars equipped with some one of the many devices of the kind or to see how stores are beginning to stock them.

As a temporary expedient—as, for example, where a tire is in bad condition, or when a trip is to be taken over vile roads, or when heavy rains have made quagmires of highways—tire protectors do not seem il ical. But as a permanent adjunct, to be u always, on all sorts of roads and in weathers, they do have an appearance of congruousness. The ordinary pneumatic is turned out in what is supposed to be a c plete form. A thick covering of rubbe provided to take the road contact and to tect the delicate and highly important containing inner tube. Tough and str fabric also surrounds this tube and che any tendency to burst or give way under tremendous air pressure. Why, then, i necessary to envelop this complete tire i crude and unsightly covering that does properly form a part of it and is palpably excrescence?

The answer is, of course, that the chief pose served by a tire protector is to prev side slip. Almost without exception it made with some device on the tread t bites into the road and hinders, if it does prevent, lateral movement of the whe Metal in some one of a variety of forms usually employed for this purpose, and w considerable success. The little spike-protuberances take hold in the hardest slipperiest roadbed and counteract to a markable extent the ever-present tendency the car to travel to one or the other side the road.

But the users of such appliances seld stop to think that they are doing great ha to the surface of the roads over which t drive their cars; or, if they notice it, entirely indifferent to the fact. They do bear in mind that the hard, smooth surf has cost a lot of time and money in the tainment, and that great injury can be d by one car; while a number of them can will leave a road in such a condition tha new covering will become absolutely nec sary. They forget, too, that heretofore of the chief boasts of motorists is that th cars, unlike horse-drawn vehicles, impr rather than injure the highways over wh they pass.

The matter is pretty certain to attract tention before long. It was only a few we ago that some New Jersey road supervis put on their thinking caps to discover wh sort of vehicle it was that left tracks beh it, and when they arrived at the conclus that it was automobiles with spike cove protectors they set to work to discover so means of nipping the evil in the bud. Th example will undoubtedly be followed other officials, and if the use of protect

Digitized by Google

becomes at all general a crisis will be reached and some modification of the anti-slip devices imperatively demanded.

Sales of Second Hand Cars.

Ordinarily the fall is not apt to be regarded as a particularly good time to invest in second hand cars. The bulk of buyers will wait until spring, considering that the nearness of winter makes it inexpedient to lock up money in a fair weather article like the automobile.

But there are a limited number of people who take just the opposite view. They are shrewd enough to see that the disinclination of most motorists or would-be motorists to invest in the dying season is precisely the reason why they should do just the reverse. The scarcity of buyers, coupled with the anxiety of sellers to dispose of cars before winter comes, operates to their disadvantage. Frequently a better bargain can be driven in the fall than in the spring, for there is a keen desire on the dealer's part to get rid of the old model before it depreciates still more, as well as to obtain the cash for it in place of having to give it storage room during the winter. These considerations affect the dealer materially, and a customer who really wishes to buy a second hand car and is willing to pay a reasonable price for one is seldom allowed to depart without having struck a bargain.

In addition to the concession in price which the buyer is almost certain to obtain, he knows that there will be plenty of enjoyable riding during the next few months, which would be lost if the purchase was deferred; and, as the car is a second hand one, there is not the same reluctance to drive the car over bad roads as would be the case if it were new. Consequently, unless the winter is a severe one, like that of 1903-'04, the car is likely to be kept in commission right through until spring.

Carrying the Spare Tire.

Few motorists who take runs of any length ever venture forth without an extra tire. One or more inner tubes and an outer cover usually comprise the outfit. The bestowal of the tubes is an easy matter. They can be so rolled and wrapped up that they occupy little room, and are disposed in the tool box or other receptacle provided for odds and ends. But the outer cover is a very different matter and gives no end of trouble.

Of course, the ideal way is to put it out of sight. Then it is not obtrusively drawing attention to the unreliability of the pneumatic tire, like a death's head at a feast. But the trouble is to find a place to put it where it will not be seen. A few thoughtful and ingenious designers provide a place of this kind—as, for example, under the tonneau flooring. In the overwhelming majority of cars, however, no provision whatever is made for an extra tire, and the owner is left to stow it wherever he pleases.

As a result it is to be seen in a variety of places. Perhaps the most popular is that in front of the radiator or bonnet, where it is secured by straps. Sometimes it is placed between the wheels, resting on the step; if the car is equipped with a canopy the tire is nearly always placed on the top of it. Of late the practice of putting it in a leather cover to protect it from dust, dirt, oil, sun, rain, etc., has been more followed, but it is by no means universal.

With the coming of the side entrance car it has been discovered that there is a new and better way of disposing of the tire. That is to fasten it to the back of the car, where, as there is no tonneau door to open, it is not in the way. Already many users of side entrance cars are making use of this wrinkle, and finding it very satisfactory.

As has been said, however, the ideal method is to place it out of sight. Then it ceases to be an eyesore and is completely protected.

The Subject of Springing.

So difficult has the springing problem appeared that there seemed room to doubt that it could ever be entirely solved. It is gratifying, therefore, to note that there is a tendency to approach it on new lines and with a recognition of the peculiar difficulties that must be overcome before any marked degree of success can be attained.

It should be borne in mind that not only must the springs of an automobile be constructed to cope with the strains and stresses of varying loads, but that speeds and roads also vary greatly. In testing a car recently we had this made very plain. With a normal load the springing was found to be just right; up to a certain point, the car rode luxuriously, even when driven at high speed. But when tried over some particularly villainous street crossings it was found that there was not sufficient strength in the leaves to take up all the jar; the result was that the body of the car came down with a bang each time one of these crossings was passed at full speed, and a fracture of one or more of the leaves was momentarily expected.

Now, if thicker leaves, or more of them, had been used, the car would have been too stiff except over the crossings. What was needed was a reserve force for utilization in extreme cases, such as that already mentioned. The fitting of rubber blocks to act as buffers between the springs and the body, so frequently seen on both cars and horse-drawn vehicles, is a crude attempt to provide a reserve force. It does good where a car is plainly undersprung. But it is, at best, a makeshift, unsightly and unmechanical, and can have no permanent place in automobile construction.

What is needed is a simple and reliable device that will automatically adjust itself to ever varying circumstances, and so give uniform results, regardless of the load and speed of the car and the character of the road.

The decision of the Automobile Club of America to seek to effect the passage of the much needed and long mooted universal lamp law is worthy of all praise and unstinted support. It makes for the safety of road travel, but, despite the plainly apparent fact, we fear it is foredoomed to failure. It would require the gentle farmer and equally gentle teamster and other "common people" to go down in their pockets for the purchase price of lamps, and the wise "statesmen" who fill our legislative halls are unduly timid in enacting legislation of the sort. But at that such a measure will throw the "common people" on the defensive and show that their desire for safe travel is limited merely to encumbering "the other fellow." It will be a point gained that must prove of assistance if anti-automobile legislation is again attempted.

It makes a great deal of difference when a dealer closes his books for the year whether he reckons from January to January or, as some do, counts his profits when the selling season comes to an end, say about October 31. In the latter case the showing is a much better one—on paper—than if figured at any other time. The dull months are still to come, with their steady outgo and meagre income, and they put a vastly different face on the matter. A big slice of the figured profit goes for those expenses, which can in no way be cut out.

The proper way to do is to wait until the first of the year before taking an account of stock. That is the turning point of the year. With it left in the rear it is pretty safe to consider that the profits shown by the books are real profits and can be disposed of in whatever manner is deemed wise.

FOR DELIVERY PURPOSES

Remarkable Success of Detroit's Auto-Express Company—Figures Show Cost of Operation.

Some convincing testimony as to the adaptability of automobiles for delivery purposes in cities is brought out by the experience of the Auto-Express Company, which uses a number of Oldsmobiles in serving stores in Detroit, Mich. The company has been in business long enough to have made a most thorough test of the reliability and efficiency of automobiles as contrasted with horse-drawn vehicles, and Mr. Scrimger, of the company, has given some interesting figures as to the relative cost of the different modes of transportation.

He declares that the automobile has proved so superior to the horse from every point of view that comparison is almost ridiculous. The company is now using twelve vehicles, doing the work of one hundred of Detroit's largest stores, and it is said that in reliability, speed and economy of operation some interesting records are being made. The large tonneau cars now replacing the small ones have proved equal in amount of service to two or three horse-drawn wagons each. The machine used on the heaviest route is covering upward of seventy-five miles daily, at an average cost of about $5 per week, exclusive of help. Mr. Scrimger says that from his knowledge of horses in this work it would require three wagons and five horses to do what this machine is doing.

Exclusive of help, it may be said that the machines cost less for maintenance than horses and wagons, notwithstanding the great difference in service rendered. In other words, automobiles cost no more to operate than wagons, and do two or three times as much work in a given time. The fact of the matter is that horseflesh simply cannot stand the steady strain that is put upon these machines. One argument sometimes advanced in favor of horses for this work is that a reserve machine must be provided against accidents. Mr. Scrimger says in answer to this that no delivery business using horses can manage without reserve animals, and, further, that there must be a reserve for every animal in use—sometimes two—whereas one reserve automobile in five has been found sufficient.

The Auto-Express Co. has been at some pains to learn what each machine costs for operation, and the result of 11 weeks' work with the large car on the heaviest route has been reduced to a table showing that in this time it covered 5,016 miles, an average of about 76 miles per day, making 6,405 stops to deliver packages. The cost for the eleven weeks was: Repairs, $7.06; repair labor, $13.80; gasolene, $31.95; lubricating oil, $4.02; total, $56.83. The item for help was $114.40 for driver and $44 for jumper boy, making $215.23 in all, or $19.56 per week. The cost per mile worked out at 4.2 cents, and the cost per package 3 1-3, but this was during the light summer months, and the machine is delivering nearly twice as many packages without increase in weekly expense.

While this is not considerably more than it would have cost to operate one wagon, it must be remembered that it would have taken, according to Mr. Scrimger, five horses and three wagons to do this work, since twenty-five miles a day of steady going four days a week is about the capacity of the best horse. The item for help is $5 a week more than would be paid to an ordinary wagon crew, but here is an actual saving of about 200 per cent, because the man and boy on the automobile delivered nearly three times as many packages as they would have done with a horse and wagon.

First Waverley Truck Appears.

The Waverley department of the Pope Motor Car Co. has for some time been at work on a heavy electric truck model, and has begun taking orders for it. One of the first orders was for a five-ton truck, placed by the Indianapolis Brewing Co., of Indianapolis.

A number of novel features will characterize the trucks. The two-motor drive through side chains direct to the rear wheels is employed. For the purpose of precluding overloading of the motors, a double reduction is employed. The spur gear on each of the motor shafts meshes with a secondary gear on a jack shaft, the motor being hung lower than usual, for the purpose of providing room for the shaft. On this jack shaft and alongside of the gear wheel is mounted a sprocket wheel, which carries a chain to the rear wheel in the usual manner.

The result is that the motor maintains a high speed, even when the truck's load is heavy and its speed slow. The danger of the motor burning out or otherwise sustaining permanent injury is thus reduced to a minimum, as it is impossible for the overload to exceed 100 per cent at any time, whereas if the usual method of gearing was employed the overload could reach 200 or even 300 per cent.

Carriage Makers Adopting Tonneaus.

Just when the automobile tonneau is on the wane the carriage builders are taking it up.

"The tonneau car is the newest style in carriages," said a carriage tradesman who attended the carriage builders' convention at Milwaukee. "It is the body of an automobile set on carriage wheels, and built to be drawn by two horses. It will hold seven persons. Several are on exhibition at the World's Fair. As yet it is too early to determine whether the style will become a fad. It was originated by the Columbus Buggy Co. Every manufacturers has from twelve to forty new styles each year, but they are not usually radical departures from the old models."

FOR RAILWAY SERVICE

How the Use of Automobiles With Flanged Wheels is Increasing; How they are Employed.

It will doubtless be news to many people when it is known that there are at present more than one hundred Oldsmobile railway inspection cars in use, and that new types for various uses on railroads are being constantly developed to meet the demands for them. The Olds Motor Works first conceived the idea of a small car built to railroad gauge, with flanged wheels instead of rubber tires, to be used as an inspection car by minor officials, such as track inspectors, construction engineers and bridge men. The first car was a small runabout of the familiar Oldsmobile pattern, built with a few slight changes in the chassis, and having a dos-a-dos seat for four persons in the centre.

This pioneer car was tested out for 8,000 miles over the Michigan Central lines, and created a profound interest everywhere. While equipped with an ordinary single cylinder motor of only 4½ horsepower, the machine demonstrated its ability to pile up an enormous mileage, and had no trouble in climbing any grade that could be negotiated by an ordinary locomotive. The fame of the "gasolene locomotive" spread to all parts of the world, and the company found that it had really discovered that much-sought prize, a "long-felt" want, so the manufacture of the railway inspection car was taken up in earnest.

Following the introduction of these handy little machines a never-ending succession of inquiries came from America and abroad for other types of railroad automobiles, for passengers, for freight, for construction and repair work, even for switching purposes, to replace ordinary locomotives. This demand the experimental department has been working on for the past year, and the result is partly shown in a large car intended for a combination passenger and construction machine. With its large tonneau, this vehicle will comfortably carry six passengers, besides two persons on the driver's seat. Without the tonneau, there is a long platform on which to carry an entire outfit of repair tools, with the crew, thus actually doubling its usefulness and making it almost indispensable to any modern railroad system.

The uses to which these cars will be put in various places are almost without limit. One small road in Utah expects to use them for carrying passengers on a short "spur" line, giving frequent service between points which provide hardly enough traffic to pay the coal bills of a locomotive. Yet, this little car will do the work and show a nice profit on it. Other roads will purchase them for the use of division officials and inspectors, for regular duties and emergencies. Only a railroad man can fully appreciate the advantages of a car of this kind, but it may

Digitized by Google

be explained that the automobile is always ready, needs no firing up; the expense of maintenance and operation is almost nothing, compared with the locomotive, and the man who uses it is his own engineer, fireman, brakeman and conductor. Moreover, the automobile is so arranged that it may be lifted bodily from the rails, like a handcar, and carried around a break or obstruction, where a locomotive would be hopelessly stalled.

In use on electric roads, the automobile has a field even wider than on those operated by steam, and officials of these corporations are taking much interest in the matter. It must be remembered that the gasolene car is independent of overhead wiring, powerhouse and everything else except its supply of water and gasolene. Perhaps the greatest argument for the automobile on trolley lines is found in the problem facing every streetcar company of caring for the light traffic at late hours. On certain lines in Detroit, it is said, the cost of hauling each passenger after 1 o'clock in the morning is nearly $1—this because of the necessity of operating the power plant to supply a very small number of cars. Being self-contained, the automobile could in this case turn a deficit into a big profit—which applies to every large city in the country as well as to Detroit.

The efficiency of these railroad automobiles, compared to those used over ordinary roads, is remarkable. Having a smooth roadbed, they run with a velvety motion that astonishes the passenger, and there are no tire troubles. This smooth motion led one track inspector who tested the small car to say that it did not suit his purpose, since he wanted to "feel" every bad place in the roadbed as he went over it; but this is a "good fault," and easily remedied by eliminating the springs entirely. In the way of repair bills, the machines are making an odd demonstration of the fact that most of the troubles automobiles are subject to arise from rough roads. Letters from railroads using them show that repair bills are almost nothing, while the expense of operation, mile for mile, is insignificant beside that of an ordinary pleasure runabout.

Railroad Automobile to Try for Record?

There is a report in circulation among the employes of the Lackawanna Railroad that the company is having a railroad automobile built at Buffalo to break the time record between that city and Hoboken. It is said that in some respects the machine will be like one that President Underwood, of the Erie Railroad Company, has had built for that line. The Lackawanna machine, however, will be much larger and built to make the trip between Buffalo and Hoboken in eight hours. It will be constructed on automobile principles, but with flanged wheels, and will carry a caboose.

C. R. Bissell is circumnavigating the globe in the interest of the Oldsmobile. He was last heard from at Ceylon.

TRUSSED FRAMES NECESSARY?

Expert Souther, Agreeing that Side Entrance Cars are Permanent, Answers Affirmatively.

Pressed steel frames, so extremely popular with the manufacturers to-day, are giving some trouble. It seems to the writer that the striking up of shapes from sheet steel into frames that suit the eye, with too little regard for the work that must be done, has been carried to the extreme. What suits the eye best will not do the work best; and if such shapes, forms and dimensions were used as would properly do the work the eye would be offended in its present notion on the correct outward appearance of an automobile.

The question of material is a serious one. In order to get the intricate and complicated shape pressed up from steel it must be a fairly soft and tough steel. This means that it must be a weak steel as well, as compared with the much stronger steels that cannot be struck up into complicated shapes.

The side members of the pressed steel frames in use to-day are uniformly not deep enough to properly support the load put upon them, with its accompanying shock and sudden strains of impact. If the present dimensions are continued every one of the frames in use should be trussed against vertical loads; some of them are. The truss is an objection to look at unless cleverly hidden under the body of the car.

No good bridge engineer would think for a moment of making a flat girder bridge to carry loads that the automobile has to carry under automobile conditions with no greater depth than given to the side frames of an automobile.

In addition to the weakness of design comes the necessity of perforating the side frames with many holes to admit of the passage of levers, of riveting, of crossbars, spring hangers and other attached parts. The metal is too thin to properly attach some of these smaller members. There have been many cases where the side frames have broken because of the twisted and wringing action of the side members. Rivets have actually been torn through the flat surfaces of the side frame.

Without going to proper and ugly depths of side frames or resorting to awkward trusses, there seems to the writer to be a good, sensible way of accomplishing the object. It is by resorting to composite structure of wood and steel.

Side frames as now built, properly reinforced by well fitting wooden fillers, will undoubtedly remove many of the objections now existing in the all pressed steel frame. The wooden filling pieces must be made to fit perfectly, so that steel and wood will work together without any lost motion and without any possibility of the thin pressed steel crumpling or wrinkling before the wood begins to take hold and do its portion of the work. The wood has a peculiar stiffness and resiliency not possessed by the soft steel, and has been used with wonderful success in the composite structure of light, high speed yachts and launches.

Wood is comparatively little injured by holes necessary for the attachment of various members of the structure. Steel is much injured thereby.

The side entrance touring car has probably come to stay, and it presents one small problem that must be met by an exceedingly stiff frame. This is the sagging of the frame, so that the side door will pinch when the car is loaded.

If all steel is to be continued, then the automobile engineer must resort to accepted truss construction and depart from the exceedingly neat shapes in use to-day.

HENRY SOUTHER.

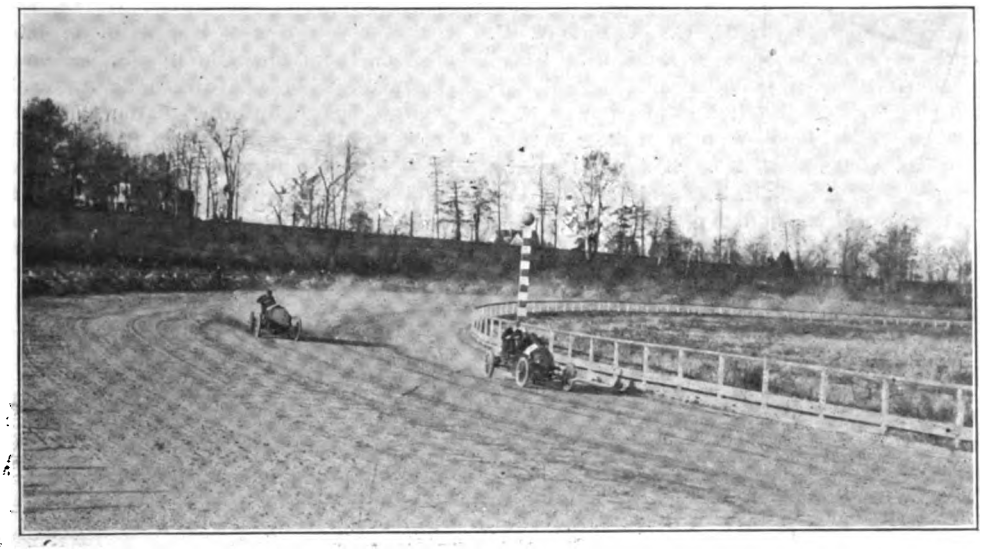
Largest Order Ever Placed.

What is probably the largest single order—values considered—for cars ever placed was recently given to the Belgian concern which makes the Pipe. The cars are to be used by a company that has been formed to work an automobile "diligence," or public service, in Central and South Italy. The order is for 600 chassis, 200 omnibus bodies and 300 wagon bodies.

The chassis will be so constructed that an omnibus body or wagon body can be fitted as occasion arises; the change from one type of vehicle to another occupying only half an hour. The omnibus body will be built so that, while in summer it can be open, it can be closed in winter. The omnibus will carry twelve passengers, and the wagons 2,000 kilos. (nearly two tons) of goods.

The Italian government and municipal authorities have given their support and assistance in a most practical manner. Some of the roads to be traversed present unusual difficulties, but it has been arranged that all awkward corners shall be done away with, and in some cases bridges will be built across ravines. The Transport Co. will enjoy the same privileges as the Italian railway companies, and, acting as feeders, they will greatly assist the railways, so that other railways and the motor diligence service will in no way be competitors.

On every road there will be fixed stopping places, at which only the passenger vehicles will stop to take up or set down. The municipal authorities of each city or town have agreed to furnish a proper station, with a waiting room, where tickets will be issued, and the comfort and convenience of passengers generally looked after. It is expected that the first vehicles will be running on January 1, 1905.



A garage is to be opened at Tacoma, Wash., by H. Hurley. He has secured temporary quarters at No. 1,716 Pacific avenue, which he will occupy until permanent ones are leased.

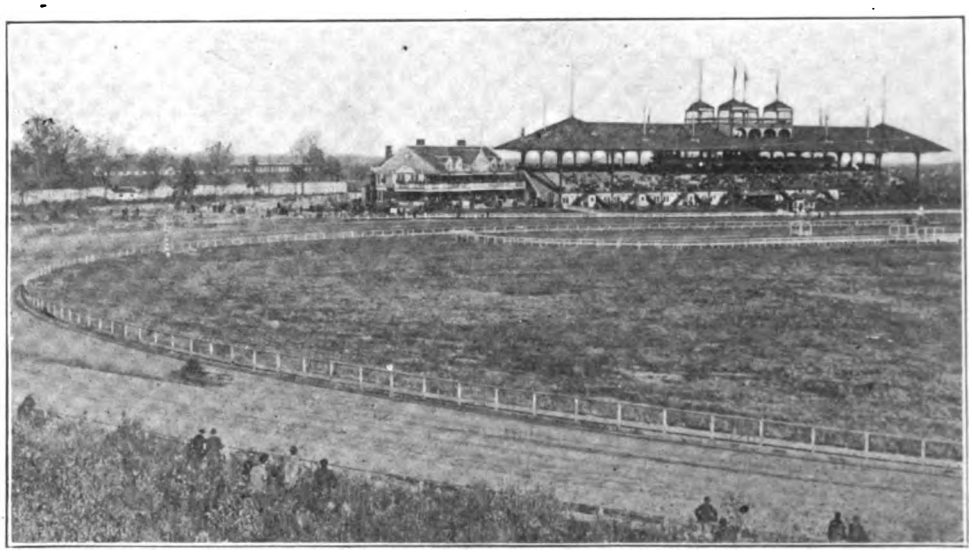
KULICK'S GREAT VICTORY

Little American Car Beats Big Foreign Racers—Kiser's Metropolitan Debut Inauspicious.

Comments that were about equally divided between doubt and derision greeted the announcement, made last week, that the Ford Motor Company would like to arrange a match for their 20-horsepower racing skeleton with the winner of the match race between the Renault and F. I. A. T. Vanderbilt Cup cars. To the partisans of the foreign cars the idea of a 20-horsepower American machine, made by putting two 10-horsepower stock motors together, entering the lists as a competitor of two European machines of 60 and 90 horsepower, was not to be taken seriously. No match was made, but the Ford met the two big machines last Tuesday in the International Cup race at the Empire City track, and defeated both of them. What makes the victory all the more remarkable in its thoroughness is the fact that the Ford had the use of but half its power for the last two miles of the five-mile contest. The Ford had a lead of 150 yards as the third mile was started, when the bearings of one of its engines got out of order and it was forced to finish with half the power it had started with.



BERNIN LEADING SARTORI.

Coming so soon after the defeat of three of Europe's greatest cars by Oldfield and his Peerless seemed to make the Ford's victory all the harder for the anti-Americans to bear, and the behavior of the spectators in the grandstand and those on the clubhouse balconies showed plainly where their sympathies were. When the little Ford swept over the tape just its own length ahead of the great red Renault, the grandstand occupants stood up and cheered Kulick until he came around again and stopped in front of the judges' stand. The clubhouse contingent had become very enthusiastic when Bernin started to cut down Kulick's lead in the last two miles, and some of them were almost excited when he so nearly overhauled the Ford in the home stretch. When Kulick had crossed the line a winner, there were a few shouts of approval from the clubhouse, but mostly the people there maintained a more or less dignified silence.

The victory of the Ford should not have been so unexpected, for it had shown its quality the same day that Oldfield drove the Peerless Green Dragon home a winner in the ten-mile world's track championship at the same course. In an exhibition that day, it will be recalled that the Ford covered five miles in 4 minutes 43 3-5 seconds. Not only was this a new world's record for light and medium weight cars, but it was faster than the time for the same distance made by any of the three big foreign racers the same day. Oldfield, it is true, had made the first five miles in his trial heat in 4:41 and in 4:42 in the final, but none of the foreigners came within ten seconds of the Ford's record, Sartori's time of 4:55 in the final being their best performance.

The only race the trial heats produced was when the Ford defeated the 25-horsepower Standard by three-eighths of a mile in the three mile contest. W. G. Brokaw had entered both of his Renault racers, the 30 and the 60 horsepower cars, but they did not race, and the higher powered one qualified by default. The 90 horsepower F. I. A. T. was the only entry in the third heat. The Ford was on the pole in the final, with the Renault next and the F. I. A. T. outside. They were sent away in a rolling start, and Bernin turned in behind the Ford at the first turn, after making an unsuccessful effort to take the lead, Sartori trailing his opponents. The Ford gained on the back stretch, and Kulick received a great ovation from the grandstand occupants when he finished the first mile 50 yards in the lead. Sartori was 10 yards back of Bernin at the time. Kulick kept on gaining in the next mile, and had 100 yards' lead as he began on the third circuit, while the thoroughly aroused crowd stood up and cheered him.

Going into the first turn of the third mile, Sartori skidded badly and almost went through the outer fence. He ran up the back stretch to the half mile pole, and then turned back when it was found that his right hand front tire had come off. The Ford kept on increasing its lead over the Renault, and was about 150 yards ahead at the end of the third mile. Kulick seemed to be in trouble in the fourth mile, but Bernin did not gain much in that mile, in spite of the Ford's mishap. Bernin did gain very rapidly in the last mile, and it seemed as if he would catch Kulick, but the latter managed to defeat the crack French car by a length. The spectators in the grandstand were nearly frantic when defeat loomed large for their favorite, and they gave emphatic vocal evidence of their pleasure when Kulick won. The band helped the jubilation by playing "Yankee Doodle" in jig time. Kulick's second and third mile times were both new records for light weight cars.

KISER'S UNSUCCESSFUL ATTACK ON RECORD.

The ten mile match race between Bernin in the Brokaw 60-horsepower Renault and Sartori in the A. G. Vanderbilt 90-horse-

Digitized by Google

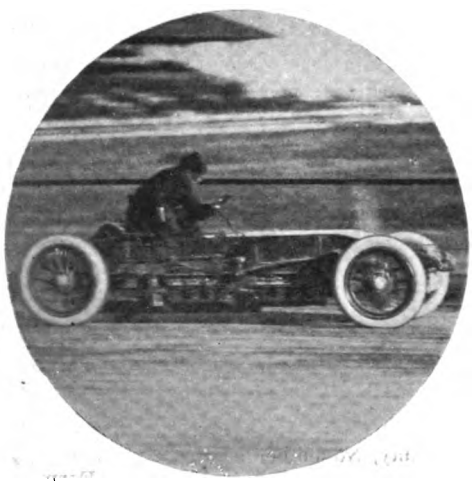
power F. I. A. T. was a procession from the start. Bernin, on the pole, secured a length and a half the better of the start, and was never in danger from then on. Sartori had fitted smaller wheels on the F. I. A. T., as he had claimed that he could not use his fourth speed on the turns with the large wheels, but there was no startling increase of speed noticeable. Sartori himself had discarded his familiar blue "jumper" and wore a dark business suit. Bernin skidded frequently as he rounded the turn into the home stretch, but it did not seem to bother him much.

The first event on the programme was a mile price handicap with four starters. The winner turned up in a 6½ H. P. Rainey, which looked more like a small racing machine than the stock car it was supposed to be. The other contestants protested it, and the matter will be decided by the Racing Committee of the A. A. A. It had 350 yards, and won by 20 2-5 seconds from an Oldsmobile. Earl Kiser made several attempts to get the Winton Bullet No. 2 going, but the best he did was 11 miles in 11 minutes 11 3-5 seconds. Frank Croker started to drive a 20-mile exhibition, but he lost a tire in the twelfth mile. He used the car with which he competed in the Vanderbilt Cup race. His time for twelve miles was 11 minutes 32 1-5 seconds. His fastest mile was the eleventh, which he covered in 56 3-5 seconds. Some good handicapping was done for the five-mile Empire Handicap, which was run off in one heat. Guy Vaughan, who had 55 seconds' start, won from Bernin, scratch, while the limit car and a 16-horsepower F. I. A. T. were close behind.

The "iron" of attendance was not as "hot" as it had been, for only 3,000 spectators witnessed the races, in contrast to the crowds of 6,000 and 10,000 that had watched the two previous meets in the last three weeks. There were about 200 automobiles inside the grounds.

Summaries:

Mount Vernon Cup (one mile; handicap according to price)—Won by A. Comacho (6½-horsepower Rainey; 350 yards); L. C. Hutcheson (4½-horsepower Oldsmobile; 350 yards), second; R. G. Howell (7-horsepower Oldsmobile; 250 yards), third. Time, 1:19 2-5.



Ten-mile match race between M. G. Bernin (W. G. Brokaw's 60-horsepower Renault) and Paul Sartori (A. G. Vanderbilt's 90-horsepower F. I. A. T.)—Won by Bernin. Time, 9:54.

International Cup (trial heats, three miles; final, five miles): First heat (American cars)—Won by Frank Kulick (20-horsepower Ford); Philip Adams (25 horsepower Standard), second. Time, 3:03 4-5. Second heat (French cars)—Walkover for M. G. Bernin (W. G. Brokaw's 60-horsepower Renault). Third heat (Italian cars)—Walkover for Paul Sartori (A. G. Vanderbilt's 90-horsepower F. I. A. T.). Final heat—Won by Kulick; Bernin, second. Time, 4:48 2-5. Kulick's time by miles, 0:59, 1:54, 2:51, 3:49 and 4:48 2-5.

Empire Handicap (five miles)—Won by Guy Vaughan (40 horsepower Decauville; 55 seconds); M. G. Bernin (W. G. Brokaw's 60-horsepower Renault; scratch), second. Time, 6:40 2-5.

Twelve-mile exhibition—Frank Croker (75-horsepower S. & M. Simplex). Time, 11:32 1-5.

Eleven mile exhibition—Earl Kiser (Winton Bullet No. 2). Time, 11:11 3-5.

KISER IN FLIGHT; LIKEWISE BERNIN.

Great Going Up Gaillon.

Phenomenal speed was attained by the cars competing in the racing section of the Gaillon hill-climbing contest on October 30. The event, which was the sixth annual, was held at Gaillon, a village about sixty miles from Paris, on the road to Rouen, and attracted a fine lot of both touring and racing cars. As usual, the preceding year's records were knocked sky high. Two cars tied for best performance, viz., a Gobron-Brillie and a Darracq, each climbing the hill in 29 seconds, which figures out a speed of seventy-two miles an hour.

The hill is exactly one kilometer—0.621 of a mile—long. It is perfectly straight, with a smooth, hard surface. The grade ranges from one in ten at the foot to one in fourteen nearer the top. Last year first honors were carried off by Rigolly, in a Gobron-Brillie, he ascending the hill in 33 3-5 seconds. On Sunday week he used the same car and made the ascent in exactly 29 seconds. Baras, in a Darracq, did precisely the same time, however, while MacDonald, in a six-cylinder Napier, was only two-fifths of a second behind the leaders.

Lining Up "Democratic" "Motorists."

What may be the New York Motor Club—the name has not yet been definitely selected, but it is said that no heed will be paid to the respectful protest of the New York Motorcycle Club—met again last night. It did not meet on the date originally set, because the chairman, who once owned an automobile, was too busy with other matters.

The presence of A. L. McMurtry and L. J. Halle gave the meeting a more genuine automobile complexion than the first one had, and as A. L. Pope and H. A. and Ed. Lozier "looked in" en route to the theatre and said "Hello! boys," their spirit heightened the complexion. The secretary, who apparently qualified for office because of once having owned a skiff or a sailboat, also exhibited a letter from A. B. Hilton, who, he added with a show of pride, lived on Fifth avenue. That the club really does purpose being "wide open" or "democratic"—ominous word just now—was indicated by the attendance of that conspicuous and nimble "automobilist," Mr. Jake Schreyer, who does not live on Fifth avenue, and who, when he is not doing other things, peddles programmes at the automobile meets at 10 cents per "pro."

There was a good deal of talking done, but the only action taken was the appointment of a committee of five to draft a constitution and bylaws. It is headed by a couple of "motorists" who own push-cycles and who ride in automobiles whenever they get a chance. The committee was given to understand that "democratic" ideas waived initiation fees and placed dues at $20 per year.

The six members of the committee which ran the automobile races at Sachuset Beach, Newport, R. I., on July 30 have been assessed $40 each to pay the expenses of the meet. The committeemen were: Reginald C. Vanderbilt, Hamilton Fish Webster, Clarence W. Dolan, William E. Carter, William R. Hunter and Frederick P. Garrettson.

OLDFIELD REGAINS THE MILE

Twice Gets Inside of the Former Record—Also Sets Up Other New Figures.

Though Barney Oldfield kept the Denverites waiting for a week while he "regained his face" by winning the four cornered match at the Empire City track on October 29, he showed them some great racing against "Old Father Time" when he drove his Peerless Green Dragon in record trials on the Overland Park track on November 5 and 6. Oldfield made deep inroads in the table of world's track records, emerging with new marks to his credit up to and including twenty miles, except those for nine and ten miles. The ten-mile record he already held, having put it at 9:12 3-5 in the final heat of the four-cornered race at the Emipre City track on October 29. The nine-mile record of 8:17 is held by Charles Basle, who made it at Providence on September 10.

Undoubtedly what pleased Oldfield most was his acquisition of the coveted record for one mile. The former time was 52 4-5 seconds, made by Earl Kiser in the Winton Bullet No. 2 in the concluding mile of a five-mile contest at Cleveland on August 22. Not only did Oldfield better this with the Peerless Green Dragon, but he covered two separate miles in faster time. He secured the one-mile record on the second day during an eight-mile exhibition ride. He made one trial of five miles during which he had wiped out the old times from two miles to five, but his fastest mile had been the fourth in 53 1-5 seconds. Later in the afternoon he came out again and made his second attempt of the day. The official time showed that he had made the second mile in 52 2-5 seconds after covering the first in a second slower time. The fourth mile was the fastest, however, as it was covered in 52 1-5 seconds, as can be seen by the table giving his time by miles. John A. Payment and G. A. Maxwell, who have acted as timers at bicycle races for many years, also timed the fourth mile, and their watches both stopped at 52 2-5 seconds.

The track surface was very fast, but as it was gravel it wore his tires badly both days. His initial attempt on the first day was for the 1 and 2 mile records. His time for the first mile was 57 2-5 seconds and 57 4-5 seconds for the second. When he stopped at the end of this ride the new tires that had been put on the machine were worn through to the fabric, and it appeared as if the crowd would not see any more of Oldfield and the Green Dragon that afternoon, as there were no extra tires at the track. But Oldfield's manager went back to Denver and brought back some heavier tires.

When the heavier tires had been fitted he came out again and went for the records up to twenty miles. His green jacket and green goggles did not "hoodoo" him this time, for he bettered the two and three mile times made by Basle, his own records from eleven to fifteen miles and those from then on to twenty miles, held by Earl Kiser. One of the most remarkable things about his twenty-mile journey was the uniformity of his time by miles. His first mile in 55 seconds was the fastest, but his slowest mile after that took but 2 1-5 seconds more time.

The best race of the day was between E. W. Swanborough in a Rambler and E. Lynn Mathewson in a Queen. It was a five-mile contest for stock gasolene cars. They kept together for almost the entire distance, but the Rambler driver sent his machine to the front in the homestretch and won by a trifle less than a yard.

On the second day Oldfield made two attempts to create new records and was successful in both of them. He would have gone further each time, but the track surface literally chewed up his tires, and he went as far as he dared each time. The track had been sprinkled, so that he was not bothered by dust, and there was no wind at all to hinder him in his attempts. His first trial was for five miles. In this ride his time was as follows: 0:55, 1:49 1-5, 2:43 1-5, 3:36 2-5 and 4:30. These were all new records from two miles to five.

He put on another set of tires and came out again, and this time he made another new set of records up to and including eight miles, except that his time for five miles was a fifth of a second slower than that made in the earlier trials. When it was announced that the time of his first mile had been 53 3-5 seconds the spectators cheered him every time he passed the grandstand. His intermediate miles were timed as follows: 0:53 3-5, 0:52 2-5, 0:55, 0:52 1-5, 0:57, 0:55, 0:53 and 0:55. This time he had bettered the times for six, seven and eight miles which had been made by Basle at Providence, his time for eight miles being 7 4-5 seconds faster than Basle's.

Swanborough and Mathewson again met in a five-mile race, and the latter secured the advantage at the start. Swanborough was the better finisher, however, and won by five yards. Swanborough later drove his machine in a handicap event against a Pope-Toledo, receiving 85 seconds' start. He gained a mile by his handicap, and Carlson, with his Pope-Toledo, could not make up the ground. The most exciting race was the last one on the programme, it being a ten-mile contest for touring cars carrying four passengers. In it there were two Pope-Toledos, Barney Oldfield's Peerless and a White. The Peerless gave the two Pope-Toledos a good race for some time, but was finally distanced. The car driven by Charles Soules, of Toledo, won out by four feet.

Summaries:

FIRST DAY, NOVEMBER 5.

Five miles, touring cars, full equipment—Won by G. A. Maxwell (Peerless); C. Miller (Pope-Toledo), second. Time, 7:02.

Five-mile motor bicycle handicap—Won by K. Hamilton, scratch; A. S. Cohagan, 5 seconds, second; J. Nash, 5 seconds, third. Time, 7:18.

Five-mile handicap—Won by E. W. Swanborough (Rambler), 1:45. Time not taken.

Five miles, stock gasolene cars—Won by E. W. Swanborough (Rambler); E. Lynn Mathewson (Queen), second. Time, 7:46 1-5.

Five miles, stock cars of not more than 10-horsepower—Won by A. R. Hall (Cadillac). Time, 8:55.

SECOND DAY, NOVEMBER 6.

Five miles, stock gasolene cars of not more than 20-horsepower—Won by E. W. Swanborough (Rambler); E. Lynn Mathewson (Queen), second. Time, 7:48 1-5.

Five-mile handicap match between J. A. Carlson (Pope-Toledo), scratch, and E. W. Swanborough (Rambler), 85 seconds—Won by Swanborough. Time, 6:34 3-5.

Ten mile handicap, Oldsmobiles only—Won by George E. Hannan (scratch). Time, 10:18 2-5.

Five mile motor bicycle handicap—Won by A. E. Cohagon (30 seconds); Louis Sanford (30 seconds) second; J. Nash (30 seconds) third. Time not taken.

Ten mile handicap—Won by E. W. Swanborough (Rambler), one and one-half miles; J. A. Carlson (Pope-Toledo), scratch, second. Time, 13:04 1-5.

Five miles, stock gasolene cars of not more than 10-horsepower—Won by E. Lynn Mathewson (Queen). Time, 8:56.

Ten miles, touring cars with full equipment and carrying four passengers—Won by Charles Soules (Pope-Toledo). Time, 13:22 2-5.

OLDFIELD'S RECORD TRIALS.

First day, November 5:

Miles.	Time.	Former record.
1.	0:55	0:52 4-5
2.	*1:51 1-5	1:53 2-5
3.	*2:47	2:47 2-5
4.	3:43 2-5	3:42 2-5

25 EVENTS AT ORMOND

Florida Carnival Will be Much Longer and More Diversified Than Ever Before.

As announced yesterday by its godfather and promoter, W. J. Morgan, the third annual Ormond Carnival, January 23-28, will be more varied and interesting than ever. There are to be twenty-five events, entries to be by invitation only. Sir Thomas R. Dewar, M. P., who gives a cup for the one-mile international record trials, will be present as one of the officials.

The races are as follows:

One hundred miles, open to all, for the Vanderbilt trophy. In case the number of starters exceeds six, the cars will be started one minute apart, and the winner determined by time instead of by position. In this case the start will be from a standstill.

One-mile record, international, open to all, for the Sir Thomas Dewar trophy. Two cars in each heat; second round of heats if necessary, winners and fastest car to compete in final.

Fifty miles, open to all American built cars. In case the number of starters exceeds six, the cars will be started one minute apart, and the winner determined by time instead of by position. In this case the start will be from a standstill.

One mile, for steam cars only.

Five miles, for steam cars only.

Ten miles, for steam cars only.

Five miles, time trials, stock cars, above $1,000 to and including $1,800.

Five miles, time trials, stock cars, above $1,800 to and including $2,750.

Five miles, time trials, stock cars, above $2,750 to and including $4,000.

Five miles, time trials, stock cars, $4,000 and over.

Five miles, time trials, racing cars of all classes.

Five miles, gasolene stock cars, $650 and under.

Five miles, stock cars, above $650 to and including $1,000.

Ten miles, stock cars, above $1,000 to and including $1,800.

Ten miles, stock cars, above $1,000 to and including $2,500.

Ten miles, stock cars, above $2,750 to and including $4,000.

Ten miles, stock cars, $4,000 and over.

Ten miles, Ormond Derby, open to all racing cars.

Five miles, handicap, stock cars only. Open only to those cars which have been entered for and have taken part in events Nos. 7 and 8.

Five miles, handicap. Open only to those cars which have been entered for and have taken part in events Nos. 9, 10 and 11.

Five miles, Great Ormond Handicap. Open only to the first five cars in events Nos. 19 and 20.

Five miles, Daytona Handicap, open to all.

Ten miles, Mercedes trophy.

Fifteen miles, open to cars of 40 horsepower or under.

Gymkhana race.

Stock cars must be equipped as catalogued, except that lamps, baskets and tops need not be carried; must carry tonneau if adapted. Foreign cars must be qualified according to American catalogues. No entry will be accepted unless catalogue is available.

In the five-mile handicap, No. 21, stock cars must be equipped as specified, and exactly as in races Nos. 19 and 20. The management reserves the right to refuse any entry for events for stock cars which, in its opinion, is not a stock car within the meaning of this rule. One trial only will be allowed in time trials. The final heats of handicaps will be rehandicapped if, in the opinion of the handicapper, any change is desirable. All events except handicaps, and those otherwise specified, will be from flying starts. Invitations and entry blanks will be ready on Nov. 13, and entries will close on Friday, January 13.

Why the Cop Stopped Homan.

Along "the row"—on Thirty-eighth street, this city—a few people "in the know" have had a quiet laugh this week over an adventure of L. J. Homan, of Homan & Schultz.

Homan was returning from the races at the Empire City track in one of the new Rambler two cylinder side entrance cars, which was being given its maiden run. In the car were Gaston Plaintiff, F. J. Wagner and a Motor World man. It was a long, dusty road, and a string of cars reached almost from the track to the city—or so it seemed. The desire to escape the dust and a wish to try the paces of the new car led Homan to depart from his usual custom of keeping strictly within the speed limit—a practice for which he is noted. He "hit it up" to such an extent that he passed not a few cars on the way, the Rambler proving itself to be a speedy, easily controlled car.

In due course the party neared the Harlem River without molestation, although several warning fingers were raised by mounted policemen. At one point an automobile and a trolley car got in Homan's way, and he had to open the throttle wide to get past them. Before he had time to slow down a policeman on foot blocked the way and raised his club menacingly. With a muttered exclamation Homan brought the car to a stop with a jerk that almost threw the occupants out of their seats.

"What's the matter?" he inquired, with considerable trepidation, while thoughts of the nearest station house coursed through the minds of Homan and his companions.

"Who won the race?" demanded the policeman. "Did Oldfield lick 'em?"

"Yes, hands down," replied Homan as soon as he could get his breath. "The foreigners weren't in it."

"Good for Barney," exclaimed the cop as he stepped back out of the road. "I knew he could do it if he tried."

And for the rest of the way Homan was too dazed to exceed the legal limit.

A. C. A. NAMES ITS SLATE

Almost a Complete Turnover—Morris for President—Takes Steps to Erect Clubhouse.

The regular ticket for officers for 1905 for the Automobile Club of America was published officially last Friday by the Board of Governors of the organization. The nominations are as follows: President, Dave H. Morris; first vice-president, Colgate Hoyt; second vice-president, W. K. Vanderbilt, jr.; third vice-president, Clarence Gray Dinsmore; treasurer, Samuel H. Valentine; governors, to serve three years, James L. Breese, Melville D. Chapman and Harlan W. Whipple. Messrs. Morris, Hoyt, Dinsmore and Valentine are new to the board of officers, though three of them have served on the board of governors. Mr. Dinsmore for several years has been the club's special representative in Europe. Mr. Vanderbilt is elevated from the third to the second vice-presidency. The annual meeting and election will take place on Monday evening, November 21. The "club night" scheduled for the following evening will be omitted. The first of the regular "club nights" will take place November 15, when George Donaldson, who has traveled extensively in Japan, will lecture on the "Yankees of the East."

In response to the complaint of the club, made to various superintendents of railroads in New York and New Jersey in regard to the failure of locomotive engineers to comply with the law requiring the ringing of a bell or blowing of a whistle on approaching a highway crossing, at grade, various communications were received from the Long Island, Erie, New York Central, Pennsylvania, Lehigh Valley, New York, Ontario and Western and other railroads, stating that the necessary instructions had been issued to their locomotive engineers.

An investigation made by the club has shown that but a very small percentage of villages in this and adjoining States have any ordinance requiring the carrying of lights by horse-drawn vehicles, and in the few cases where such ordinance was on the village books it was practically a dead letter. It is proposed to have a State law passed requiring all horse-drawn vehicles in every such town and village of the State to carry the necessary lights.

A special committee, consisting of A. R. Shattuck, Jefferson Seligman, Colonel John Jacob Astor, William K. Vanderbilt, jr., Arthur Iselin and Harlan W. Whipple has been appointed to consider the building of a suitable clubhouse and thoroughly equipped garage.

Long distance driving honors are claimed by Dr. Ryfkogel, of San Francisco, Cal. He says he has driven his automobile more than twenty thousand miles on the streets of San Francisco.

FIRST STEP AGAINST FERRIES

Papers Finally are Filed and Law Will be Tested —What the Action Discloses.

The expected suit of the United States Government against the Brooklyn Ferry Company for carrying an automobile with its gasolene engine running materialized last Monday in the libel filed by Henry L. Burnett, United States District Attorney, against the steamer Texas, owned by the Brooklyn Ferry Company. The government's side of the question is being handled by Assistant United States Attorney Baldwin, as told in the Motor World two weeks ago, while the ferry company will be represented by Herbert Green, of Wilcox & Green, 1 Broadway, New York. In fighting the case, Mr. Green will have the aid of W. W. Niles, counsel of the Automobile Club of America, and will also be aided by an expert in gasolene engines.

The libel discloses the fact that half of the fine, in case it is assessed against the Brooklyn Ferry Company, will go to the informer in the action. Just who the informer was cannot be learned, though it is surmised that the information was lodged at the instigation of the Automobile Club of America. Mr. Green will file an answer to the libel as soon as he can draw up the papers, which he expects will be in about ten days. He will deny that there was any fire in the automobile in the meaning of the amendment, and will also deny that gasolene was carried as fuel. The machine which was the cause of the action is numbered 11,119, and was carried from the foot of East Twenty-third street, Manhattan, to the foot of Broadway, Brooklyn, on October 14 last.

The libel recites that the complaint is against the Texas and her owners, and the first three parts of the libel are devoted to the statements that the Texas is within the maritime jurisdiction of the court, was a steam ferryboat carrying passengers between the foot of East Twenty-third street, Manhattan, and the foot of Broadway, Brooklyn, and the boat was owned and operated by the Brooklyn Ferry Company, a New York corporation.

The fourth part of the libel is as follows:

"Fourth—That Section 4,472 of the Revised Statutes of the United States, as amended by act of Congress of February 27, 1877; c. 69, Sec. 1, and act of February 20, 1901, c. 386, 31 Statutes 799, is now, and was on the 14th day of October, 1904, as follows, viz:

"'No loose hay, loose cotton or loose hemp, camphene, nitroglycerine, naphtha, benzine, benezole, coal oil, crude or refined petroleum, or other like explosive burning fluids, or like dangerous articles, shall be carried as freight or used as stores on any steamer carrying passengers; nor shall baled cotton or hemp be carried on such steamers unless the bales are compactly pressed and thoroughly covered with bagging or similar fabric, secured with good rope or iron bands; nor shall gunpowder be carried on any such vessel, except under special license; nor shall oil of vitriol, nitric or other chemical acids be carried on such steamers except on the decks or guards thereof, or in such other safe part of the vessel as shall be prescribed by the inspectors. Refined petroleum which will not ignite at a temperature less than 110 degrees of Fahrenheit thermometer may be carried on board such steamers upon routes where there is no other practical mode of transporting it, and under such regulations as shall be prescribed by the board of supervising inspectors with the approval of the Secretary of the Treasury; and oil or spirits of turpentine may be carried on such steamers when put up in good metallic vessels, or casks or barrels well and securely bound with iron and stowed in a secure part of the vessel; and friction matches may be carried on such steamers when securely packed in strong tight chests or boxes, the covers of which shall be well secured by locks, screws or other reliable fastenings, and stowed in a safe part of the vessel at a secure distance from any fire or heat. All such other provisions shall be made on every steamer carrying passengers or freight, to guard against and extinguish fire, as shall be prescribed by the board of supervising inspectors and approved by the Secretary of the Treasury. Nothing in the foregoing or following sections of this act shall prohibit the transportation by steam vessels of gasolene or any of the products of petroleum when carried by motor vehicles (commonly known as automobiles) using the same as a source of motive power;

"'Provided, however, that all fire, if any, in such vehicles or automobiles be extinguished before entering the said vessel, and that the same be not relighted until after said vehicle shall have left the same; provided, further, that any owner, master, agent or other person having charge of passenger steam vessels shall have the right to refuse to transport automobile vehicles the tanks of which contain gasolene, naphtha or other dangerous burning fluids.'"

The fifth part recites that Section 4,499 of the Revised Statutes of the United States, as in force now and on October 14, 1904, provided that the owner of any vessel propelled by steam not complying with the above regulations shall be liable to a penalty of $500, one-half of which shall go to the informer.

The sixth part is as follows:

"Sixth—That on said day, to wit, the 14th day of October, 1904, at about 10:28 o'clock in the morning, said ferryboat, being on one of her regular trips on the East River between said ferry terminl, and having passengers on board, carried as freight, across the East River, from the foot of East Twenty-third street, Borough of Manhattan, to the foot of Broadway, in the Borough of Brooklyn, New York City, a quantity of gasolene, the same being an explosive burning fluid, which fluid was contained in a tank or other receptacle attached to and forming part of a motor vehicle (commonly known as an automobile), which vehicle was No. 11,119; that said vehicle used the said gasolene as a source of motive power, and there was at said time a fire in said vehicle which was not extinguished before said vehicle entered said vessel at said East Twenty-third street and was relighted before said vehicle left said vessel at the foot of said Broadway."

The seventh part says:

"The carriage of said gasolene in the manner aforesaid was in violation of the law, and especially in violation of the terms of said section of the Revised Statutes, and the owner of said ferryboat, to wit, the said Brooklyn Ferry Co., of New York, thereby became liable to the United States in the penalty of five hundred dollars, one-half for the use of the informer who reported the said violation, and the ferryboat Texas also became liable for the said penalty and liable to be seized and proceeded against by way of libel in this court."

The libel winds up by the United States Attorney praying for the usual process against the "Texas, her boilers, engines, tackle, apparel and furniture," and that the court decree for the penalty aforesaid that the ferryboat may be condemned and sold to pay the said penalty with costs.

Sued for Damage Caused by Towed Car.

An interesting and novel legal point was raised and decided in a Long Island court last week. It involved the question of responsibility for damages caused by an automobile while being towed. The decision handed down was to the effect that the responsibility lay, not with the owner of the towed machine, but with the person or company doing the towing.

The case came before a jury in the First District Municipal Court, Long Island City, Judge Kadien presiding. A verdict was rendered for $100 damages in favor of Allen Davis in his suit for damages for the wrecking of his vehicle, which was run into by Frank Croker's racing car the day after the race for the Vanderbilt Cup.

Davis and his wife were driving in Long Island City when the accident happened. Croker's racer was being towed home by an automobile belonging to Smith & Mabey. Davis and his wife were thrown out, and Mrs. Davis, her husband says, was severely injured. Davis sued for $200.

Judge Kadien said it had not been shown that there was any one in the Croker automobile when the collision occurred, and that, as the racer was being propelled by an automobile in charge of an employe of Smith & Mabey, that firm was responsible for any damage that had been done. The jury accordingly found a verdict against the firm.

The brougham is an evolution of the Sedan chair. The principal change consisted in mounting it on wheels instead of swinging it on poles and having it carried by men. It takes its name from Lord Brougham.

LO! THE MOTORING DEER HUNTER

How He Penetrated the Maine Woods, Emerging with Horns– the Kind that Don't Toot.

There won't be much of the wild and picturesque Maine regions left to be explored if motorists continue to plunge into its remotest recesses at the rate they are doing.

Time was when these recesses were penetrable only afoot or in homely vehicles drawn by slow footed quadrupeds. But now only a few sections are virgin of the ever-advancing railroad, while the automobile is even more ubiquitous. It traverses the State from one end to the other, leaving wonder in its wake.

One of the most recent invasions of the Pine Tree State, a la automobile, was made by George H. Lowe, of Boston, manager of the White New England branch, and E. W. Young, of New York. Accompanied by a mechanic, they drove in a White steamer to a point nearly 150 miles beyond Bangor. Being, like Nimrod of old, mighty hunters, "Pop" Lowe and his friend then proceeded to make a "bag" of game, such as would astonish their friends, in which task they succeeded even beyond their expectations.

It had been the original intention of the adventurers when they left Boston to leave the car at Bangor, but the weather was so ideal and the car worked so perfectly that they decided to continue on the next morning toward Patten, a town 130 miles from Bangor.

From Bangor to Brownville the road was found to be in good condition. North of this town, however, the backwoods roads were encountered, and as Lowe says, "the man that sat in the tonneau had rather a hard time of it keeping in his seat."

Patten was reached on Thursday, and a stop was made overnight. A guide was engaged there and plans made for the hunting trip for which the party was so eager. A camp was found on the shore of Shinn Pond, fifteen miles from Patten, and the guide informed the hunters that the place was generally reached afoot.

That fifteen miles was the longest that any of the party had ever experienced, but thanks to the assistance of several woodsmen it was made within four hours by hard toiling. Bridges had to be built, fallen logs had to be removed, wide detours had to be made to avoid boulders and all sorts of obstructions in the path.

Once in the camp the steamer was left under cover to rest for a week, while the party took to the woods in search of big game. All met with success; each got his full quota of deer, but Lowe was the only one fortunate enough to bring down a moose. The moose weighed 900 pounds and had a fine spread of antlers. The head was sent to Bangor to be mounted.

At Patten the party shipped the deer by train, but came back themsIves in the touring car.

WHEN THE MOTOR GAINS POWER

The Remarkable Effect After Sunset and Some of the Things it Suggests.

"Why is a more powerful mixture obtained in the evening than at midday?" asks an experienced motorist. "There can be no question about it at all; it is the mixture. Other conditions being equal, the explosions become more powerful after sunset. One may lag at noonday and race at twilight. Often toward evening, generally after sunset, your engine seems to want to spring away from you. You may cut down the gas and retard the spark, but still it leaps away like a thing possessed, and there seems no holding it back.

"'Oh, your cylinder is cooler!' is generally the loose and very false explanation. Upon the face of it that is an unstable theory. Why does it not behave in the same flyaway manner on a cool or cold day in the daytime? If change of temperature was the secret, why does the same thing happen on a winter's evening when there has been no appreciable fall in temperature? In many ways I have convinced myself over and over again that it is not due to change of temperature, but to atmospheric conditions.

"Will some one define exactly what takes place? If the air is more oxygenated, why does not the artificial introduction of oxygen have the same effect? I once saw an enthusiastic friend with a small cylinder of compressed oxygen making the experiment, but without any satisfactory result. The change I chronicle is so marked that it is a wonder more study has not been made of the reason.

"If we knew exactly what took place naturally, why could we not supply the same conditions artificially, thereby getting so much more power out of the same quantity of gasolene?

COURT READS "RIOT ACT"

Chicago Violates Farson Injunction and Reaps a Whirlwind—Tag System Condemned.

Quite the most sensational utterances yet delivered from the bench, and directly attacking the entire system of numbering automobiles, emanated from Judge Hanecy, of Chicago, last week. As has so often been the case, Judge Hanecy's fulminations were called forth by the action of John Farson, that sturdy upholder of the rights of citizens who happen to be also motorists.

It will be recalled that Farson obtained from Judge Hanecy an injunction restraining the Park Boards from interfering with the running of his automobile, owing to its being unnumbered. That injunction was observed as far as Farson was concerned, but one day the latter's chauffer was caught alone and arrested, it being claimed that the injunction applied only to Farson. The chauffeur, Bangs by name, was taken before Justice Prindiville and fined $5 and costs. Farson's lawyers declared that the fine would never be paid, and at once sought for and obtained a temporary writ of habeas corpus from Judge Hanecy, upon which Bangs was released on his own recognition.

In granting the writ, Judge Hanecy arraigned in unmeasured terms "high officials" of the city for their action in disregarding the injunction and arresting Bangs.

"There isn't any wonder that there are violations of the law by automobilists and other citizens when the lawyers, city officials and employes, police and justices of the peace set the law at defiance and put themselves above the law," the court declared in his decision. "This defiance of the law runs all through the fabric of the government, it seems. It must stop. It will stop some day, and in a way that will shake some of the higher officials as they have never been shaken before.

"The endangering of lives and property by automobilists is the underlying principle in the city ordinances," the court declared. "But because they do become dangerous it is no reason why the decision of the Supreme Court should be violated. Then, in every one of the labor strikes, where there is far more damage done and more danger to the lives and limbs of citizens, often causing the destruction of life, why shouldn't the common council pass an ordinance that every man that belongs to a labor union should be tagged, so that whenever any violence or damage is committed the police could capture him?

"Then the police might have no more to do than to stand on some street corner and look at events with a long glass until they see a man with a number violating the law and then they could go over and arrest him. The comparison is not overdrawn. The principle is the same."

Referring to the return of the city in the habeas corpus proceedings, in which Assistant Prosecuting Attorney George Kriete contended that the justice had acted under the theory that the injunction obtained by Farson did not apply to his chauffeur, Judge Hanecy replied:

"According to you, then, every justice of the peace and every police officer could review the actions of the Superior or Circuit Court and interpret an injunction as they are pleased to. If you contend that an injunction is not effective unless it covers not only the man who got it, but all his employes and operating apparatus (and if it does not, then some justice of the peace or police officer could say, 'We'll review it and decide what it may cover'), then law couldn't exist very long or society couldn't exist very long if that were the case.

"It isn't very strange that one justice of the peace should think that he has the right to review a case when the newspapers and so many others are doing it every day. It makes no difference whether an injunction is properly sued or not, it must be obeyed in any circumstances. The only remedy is to have it dissolved by due process of law."

Judge Hanecy then referred to the Supreme Court decision in which the final tribunal of the State held that no municipality has the right to tag or number any private vehicle.

The city's counsel, who did not have much opportunity to defend the city's position in the arguments, himself received a reprimand from the court when he inadvertantly referred to the Appellate Court decision given in the Banker injunction case and stated that Banker had "procured" the decision.

"No, he did not procure the decision, nor did any one else procure the decision. It was a decision given by the judges of the Appellate Court from a careful review of the case. I cannot permit such language in my court, nor can I permit you as a lawyer and sworn to respect the Appellate Court to speak in that way."

Scarritt Inaugurates New York's "School."

President Scarritt of the Automobile Club of America delivered the opening address at the formal opening of the automobile school of the West Side Y. M. C. A., New York, on November 9. The class numbers 136 students, some of whom are owners of cars who wish to know more about how to care for them. Mr. Scarritt advised his hearers to master their machines, to be prepared to stop instantly at all times, and to show care and consideration for other users of the highways.

Other addresses on the work of the school were delivered by William M. Kingsley, chairman of the committee of management; Walter L. Hervey, Ph. D., and H. S. Colburn, educational director. The operative classes are filled up, and it will be impossible to add to the number for this term of three months. Work in the operative class has been started under the direction of Clarence Bowne Brokaw. The first of the regular illustrated lectures will be given next Wednesday night by C. E. Lucke, Ph. D., director of experimental engineering at Columbia University.

FOR GLIDDEN TROPHY

Deed of Gift Defines Conditions—First Three Contests Must be Held in America.

At the meeting of the Board of Directors of the American Automobile Association, held on November 3 at the clubhouse of the Automobile Club of America, the deed of gift for the Charles J. Glidden Touring Trophy was formally signed by the donor and accepted by President Whipple and the directors of the A. A. A. The conditions provide for a tour of at least one thousand miles of not less than five hundred a week over the regular highways of the country, where the trophy is held. The contest must be held in the United States or Canada or both countries during 1905, 1906 and 1907. One stipulation is that cars must be driven by the owner or a driver approved by the committee when the owner must be a passenger.

The deed of gift is as follows:

First—The trophy shall be known as the Charles J. Glidden Touring Trophy.

Second—The cup shall be competed for annually, beginning with the year 1905, by members of any American automobile club affiliated with the American Automobile Association who have been members of such club for at least one year, or of any club in the world recognized by it of which such contestant shall have been a member at least one year. The club of which the winner is a member shall have the custody of the trophy until it is won by another, and shall give to the American Automobile Association or its successor satisfactory bond, with sureties, in the sum of three thousand ($3,000) dollars for such custody.

Third—The distance to be driven in competition shall not be more than one thousand miles nor less than five hundred miles weekly, and shall be over regularly used highways in the country where the holding club is located, except in the years 1905, 1906 and 1907, when the contest shall be held in either the United States or Canada, or both.

Fourth—Each entry must be accompanied by a fee of not less than $100 for each member entered. Of the entry fee 50 per cent shall be refunded upon starting. In event of failure to start the entire fee shall be forfeited to the holding club.

Fifth—The car shall be driven by the owner or a driver approved by the committee, the owner being a passenger in the car.

Sixth—All other rules governing the contest shall be fixed by a committee of seven, consisting of the president of the American Automobile Association, who shall be chairman; the donor, and the presidents of the Automobile Club of America, of Great Britain and Ireland, of France, of Germany and the president of an automobile club in Canada, to be recognized by the American Automobile Association, or representatives selected by the above-named persons. The chairman and two members of the committee shall constitute a quorum.

ORIENTS
FOR 1905.

An attractive line of Cars ranging from $425 to $2,000.

WE are pleased to announce that in addition to our Buckboard line we shall offer for the coming season an excellent four cylinder air-cooled touring car, with side entrance tonneau and thoroughly up-to-date construction, to list at $2,000. Also an attractive Car of latest construction, listing at $1,500. It is our intention that our ORIENT line for 1905 shall be second to none, and comprise one of the most attractive agency propositions on the market. We invite correspondence and shall be pleased to furnish photographs and full information to those who desire to consider our agency.

WALTHAM MFG. CO., Waltham, Mass.

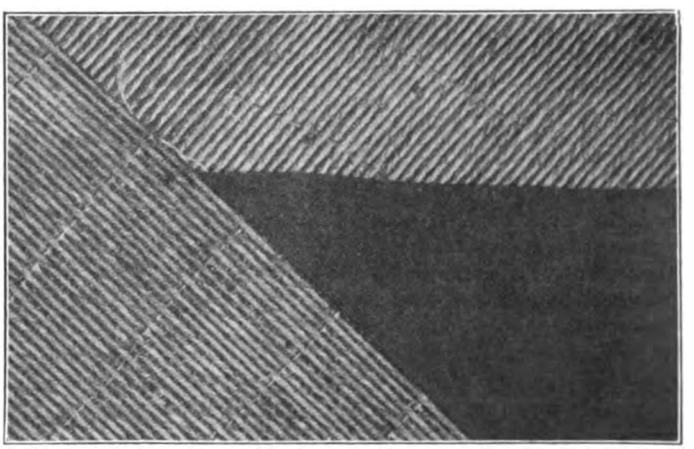
HOW THE G & J IS MADE



The Thread Fabric and Its Treatment and the Relation of Fabric to Durability Explained.

It is not often that an article "catches on" so quickly or so speedily leaps into fame as the G & J thread fabric tire. It is scarcely three months ago that it made its first appearance at the Detroit race meet. It won on that occasion, and it is not inapt to say that it has been winning ever since.

Every man who ever rode a bicycle knows the part that the thread tire played and plays in the performance of that vehicle, and it is not strange therefore that a resilient, responsive tire of a similar type should prove so effective on the self-propelled car. That it is really posible for a tire to "make a slow car fast and a fast car faster," as has been claimed for the new G & J tire, is rendered easy of belief by the performances of Oldfield, Lyttle and Kulick since they have made use of it.

The thread fabric after being frictioned on one side. Note the beads of rubber that have been forced between the threads.

Showing the way the strong threads cross each other, with rubber between the layers.

It is, of course, fairly well known that G & J tires always have been moulded in circular shape, thus placing the least possible strain upon the fabric used in the side walls, but the exact nature of the new thread fabric and the method of treating it and forming it into a complete tire is little understood. In response to the Motor World's request, President H. O. Smith has made this plain.

"Until we used threads," he says, "the fabric used in the construction of automobile tires was a close, square woven cloth, the term 'square woven' being used to describe the special weave—the feature of the cloth being that the filling threads were the same number, size and strength as the warp threads. Thus the cloth was as strong one way as the other, hence the term 'square woven.'

"The effective strength of the fabric entering into the construction of a tire does not depend entirely upon its tensile strength, but in a large degree upon the method used in construction, which determines whether or not the entire strength of the fabric has been used to the best possible advantage. This should be reckoned on the basis of the work performed by each separate thread used in the construction of the tire.

"In the thread tire, as made by us, the fabric is so placed and controlled that each and every thread is used to the best possible advantage; while in a tire made of square woven cloth it is impossible to place each separate thread in the proper position to accomplish the best results, owing to the fact that the threads in such fabric cross and recross each other, one over and one under the other. In the necessary operations in the factory to prepare the square woven cloth for the actual making of the tire, one set of threads is drawn to the utmost tension, while the others, or cross threads, are left in their normal condition. Thus, when a tire constructed with square woven cloth is inflated and the individual threads are put to the greatest tension, the natural tendency is for the threads to form as near a straight line as possible, and in consequence great pressure is exerted at point of contact where the threads cross each other. When the bias fabric changes its position, as it must when the tire is in service, and sets up a chafing action between the fill and cross threads, the result is that the individual threads of the tire are destroyed, not by pressure, but by the chafing action of one thread against the other, which action is continuous while the tire is in service. Not only does this chafing action affect the threads of the tire, but it also generates an internal frictional heat. Constantly subjecting rubber and fabric to heat has a deteriorating effect on the tire.

"A tire made of square woven cloth is subject to damage by any moisture which can get to the cloth by reason of a cut in the outer rubber cover, or otherwise, and as each thread in each layer of the cloth comes in contact with the other, the whole of that layer may be affected by the moisture, as the capillary attraction will allow the wet or moisture to travel the entire length of the cloth, while in the thread tire the moisture would affect only the few individual threads in direct contact with the cut, for the reason that the threads in this tire do not touch each other—an important point in considering the life of a tire.

"Each layer of cloth is rubbered, or frictioned before being put into the tire. This consists of a rubber surface on the cloth, and the rubber is pressed into the meshes of the cloth, forming, as it were, a small individual rubber rivet. When the different layers of fabric are built up in a tire, the greater part of the adhesion is reckoned on a basis of the strength of the rubber rivets referred to. These rivets are formed in the shape of the mesh of the cloth at the time it is vulcanized or cured, which is done by heat under pressure. With the cloth cut on a bias, and the tire changing in shape as it does in service, the shape of the mesh itself changes, having a tendency to destroy the adhesion of the rubber to the fabric, and at the same time the fabric changing position has a tendency to destroy or break the rubber rivet. The action is really an opening and closing one, which not only cuts off the rivet, but injures the fabric at the same time, and when once these rivets begin to get loose the adhesive power is lessened and the layers of fabric, or as it may be, the outside cover, begins to let loose. This action materially assists the chafing action, already described, to set up a frictional action, which is indicated by the internal heat of the tire.

"With the threads which we use in making our 1905 G & J tires, the fabric consists of a number of parallel threads of great strength. The uniform tension of the individual threads is assured by the fact that we have an absolute check on each thread, which is an essential point, and it is also important that these threads should be so laid that they cross each other at the proper angle, and by the methods pursued we have been able to accomplish this result. If the threads were under irregular tension, those on the greatest tension would have a tendency to exert an undue pressure on the threads which they cross at right angles, and probably result in

Digitized by Google

the destroying of the threads. Each thread is imbedded in a cell of rubber, forming a perfect insulation, and there is a layer of rubber between the different layers of threads, preventing the threads from coming in contact in crossing each other.

"By this method of construction, each thread while acting under the same conditions and in harmony with the other threads, operates separately, preventing the heating already referred to, which is common in tires made of square woven cloth. In the thread tire there is one continuous rubber bead running the entire length of the tire between each thread, which insures a perfect union between the different layers of threads as well as an ideal union with the rubber cover itself, which allows the tire to be vulcanized or cured in what can properly be termed one solid, homogeneous mass, with merely the threads laid in the rubber. Those threads are very pliable, and allow the tire to change position in service with the slightest possible resistance, which means, as has been proven by extensive experience, that the tires are very pliable, fast and free from internal heating.

"It has also been proven that a tire of the thread fabric construction will last much longer than a tire made of square woven fabric, as with the threads there is not the self-destroying tendency that exists with the square woven cloth tire, and in consequence the thread tires will literally wear out in road service rather than have their usefulness ended by self-destruction. Any tire that can stand the use and abuse of a racing car will stand anything."

Baskets for Automobiles.

Making baskets for automobiles is almost a special trade of itself. It requires peculiar skill, because it is hard to fashion the curves so as to fit snugly in the sinuosities of the motor cars.

Polish basket weavers, who learned and long practised their trade in Europe, seem to have special aptitude for this particular kind of basket work. The materials that go into the baskets are reeds, whole or split; whitewood, cylindrical bits of birch, leather, brass for the hinges and rubber oil cloth for the waterproof lining. A basket once well made and coated with shellac, will last almost forever, barring accidents, and will ordinarily need no repairs beyond a new coat of shellac at the end of the season.

Most of the material that goes into these baskets is of native production, though some of the reed comes from the Orient and some from the West Indies.

Acetylene lamps are sometimes not hung properly on the brackets. The latter may be inclined forward from the vertical, causing the light to strike the road close to the car and showing very little light ahead, or they may be inclined backward, causing the light to shine upward, and leaving the road close to the car in comparative darkness. The remedy in both cases is obvious.

PALMER'S NEW TIRE

Veteran Rubber Man Produces a Mechanically-Attached Article of Much Interest.

H. A. Palmer, Erie, Pa., who has spent many years in the rubber trade, and who has been identified with at least two tire factories of prominence, is the inventor of the mechanically attached tire shown by the

accompanying illustrations, which display the fastening and general principles of the tire to advantage.

It is Mr. Palmer's claim that the inner tube is easily removed in two minutes, and that it can be replaced and made ready for

inflation in the same length of time without special effort. All that is necessary to remove is the felloe bolt nuts, when the outer flange, which is bolted to the edge of the tire with large head bolts, can easily be withdrawn from the felloe far enough to readily remove or replace the inner tube. The small bolts that fasten the tire to the flanges are never removed unless it becomes necessary to change or repair the casing. In that event it is a simple matter to strip the wheel, leaving a solid plain wagon wheel, which may be used as such in emergency.

The tire being mechanically fastened (with inextensible edges), it cannot creep or roll off the rim, whether inflated or deflated. The air chamber is smooth and nearly round, thus admitting of a natural and favorable condition for the inner tube, which may be provided with either a rubber or metal valve stem.

Rim cutting is entirely eliminated, as the gently flaring flanges curve outwardly, giving the casing a smooth surface to roll on either when inflated or deflated. Several important tests have proven favorable on every point.

Carriage Makers Express Opinions.

Two widely differing views were given expression at the recent convention of carriage makers at Milwaukee, Wis., regarding the effect on the carriage trade of automobile sales. Which was the more sincere, as well as the more accurate, is scarcely open to question.

"The automobile craze has not hurt the carriage manufacturing business in the least," J. H. Baker, of Newark, N. J., is quoted as saying, "and it will never hurt it. There are more carriages being manufactured today than ever before, and more will be built next year. I know of one firm in Evansville, Ind., that turned out thirty thousand 'jobs' last year and cleaned up every one of them. The automobile is a fad, the same as the bicycle and roller skates. The prices may get down to $200 sometime, when many people can afford them, but that will never interfere with the carriage business. People who like to drive horses are never going to give them up for automobiles. I wouldn't give my team of horses for all the automobiles in the country."

"Eastern manufacturers of high grade carriages are beginning to fear the growth of the use of automobiles," said A. O. S. Allan, of Cleveland. "I have not heard that any figures have been made showing injury to the carriage trade as yet, but the automobile seems to have come to stay, and wealthy people who are riding in them used to ride in stanhopes, laudaus, surreys, traps and victorias. Nearly all vehicles of this class are made in Massachusetts and New York.

"Manufacturers of buggies, costing from $20 to $175, will not be affected soon by the introduction of the automobile. Most of the enormous output of buggies is bought by farmers. Every farmer must have one, and every young countryman must have one as soon as he is big enough to take a girl to meeting."

An Ingenious Gasolene Gauge.

A useful article that has appeared "on the other side" is a gasolene gauge, which is soldered flush on the top of the tank. The cork inside the tank, floating on the surface of the spirit, turns an indicator in the little dial, which tells at a glance what amount remains within.

Winter Care of Cars.

The motor house should be dry, well lighted, ventilated, and, if possible, kept at an even temperature of about 60 degrees.

Should it be damp, metal work will rust, woodwork swell, paint and varnish be destroyed, interior upholstery be spoiled, stitches in leather work will rot, leather surfaces will lose their brilliancy, cloth and carpets will fade, and moth will be attracted when the weather becomes warmer.

Should the house not be well lighted, paint and varnish will suffer, black panels will become green, white panels will turn "biscuit," primrose become orange, blues, especially light blues, will fade badly.

The following precautions should be adopted when it may be difficult, if not impossible, to heat the motor house in winter.

Remove all cushions, loose carpets, etc., from the interior, and place them separately in shelves, preferably indoors, if room can be found for them; thoroughly clean the car throughout, treating all coach builder's work exactly as a carriage, carefully sponging all panels and drying with a chamois leather.

Wash the car once a fortnight, employing an experienced man for the work. He must use clean, cold water only, and dry the car carefully with a chamois leather. Tepid, not warm, water may be used if there should be any "bloom" on the panels. Should the temperature be freezing, washing should be postponed.

Carefully remove all dust from the interior upholstery with a very soft brush, and use a duster (preferably a soft piece of cloth the same color) to rub the leather parts; clean and polish all plated parts, and afterward rub them over lightly with a clean oiled rag.

Apply lightly a little unsalted tallow to locks and dovetails of doors, also to the siding rods of the dust screen.

An excellent method of preserving the leather upholstery of a car is to apply a coat of leather dressing. This tends to keep mildew away. It is, however, necessary to give the car a frequent airing, which is the best preventive of mildew.

Novice of the Right Sort.

What can be done by a novice who possesses intelligence and is willing to devote a reasonable amount of time to the study of his automobile in order that he may not be entirely helpless when any little thing goes wrong, is shown by the experience of Burke Vancil, a Springfield, Ill., man.

"The biggest bill for repairs was for 40 cents, and they were necessary, because of my own carelessness," said Mr. Vancil, in enforcing his argument that a car properly cared for and understood will run for months without break or failure.

"I have had three punctures," he continued. "I bought my machine June 1, and have taken care of it personally. I learned its mechanism thoroughly, for I considered that the easiest and quickest way to save money. When I bought it I understood I was buying trouble, for 75 per cent of the owners of machines do have endless trouble and expense.

"I have been very agreeably surprised at the result. In these five months I have travelled at least three thousand miles. Since the 10th of August I have gone nine hundred miles, and during two weeks of this time the machine was in the shed. I have never scared a horse or had an accident."

Even the Minstrels Succumb.

A long string of automobiles filled with the members of a minstrel company now performing in this city attracted a great deal of attention in lower New York City one day last week. The bones and tambourine experts were on parade, and that they made use of the motor vehicle is a pointed commentary on the ever-growing popularity of the most modern of conveyances.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—1904 White Touring Car with top, gas lamps and side baskets. Car guaranteed first class shape; $1450.00. Reason for selling—buying 1905 Model "White." Address T. W. J. SUITE, 28 Manhattan Blk., Cleveland, Ohio.

FOR SALE—1904 Oldsmobile runabout, nearly new, very cheap, want larger car. K. F. PUTNAM, Mount Carmel, Ill.

FOR SALE—Late pattern, Model L, 1904 16-h. p. Rambler touring car, in excellent condition; good bargain. Want larger car next season. WM. E. STEELE, Cory, Pa.

WE have discontinued the Franklin agency, and have one brand new Franklin tonneau, car finished in dark blue. Price, $1400.00. FISHER AUTOMOBILE CO., 330 N. Illinois Street, Indianapolis, Ind.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

1 14-H. P. "Pope-Toledo" with canopy top, baskets, in good order, - - - $1000
1 24 H. P. "Pope-Toledo" with top, baskets; revarnished, guaranteed in perfect order, - - - - - - $1800
1 10-H.P. Pope-Hartford, practically new - $750

THE SPLENDID ACHIEVEMENTS OF

GOODRICH TIRES

for 1904, constitute the most noteworthy tire occurrence of the season.

Time after time in the longest, hardest and fastest trips they have gone through without mishap; helping to make a speed record here and a happy long distance automobile tourist there.

Never disappointing, never hindering—just go where you please, Goodrich Tires will take you through.

Pleasant remembrances for 1904. The best tire investment for 1905.

The Week's Patents.

12,281. Electric motor. Albert B. Holson, Chicago, Ill., assigner, by mesne assignments, to the Holson Motor Patents Company, Limited, Grand Rapids, Mich. Filed May 31, 1904. Serial No. 210,583. Original No. 701,341, dated June 3, 1902.

Claim.—1. In a motor, a rotary member, provided with an annular duplex rack, a shaft arranged within said rotary member and carrying pinions fixed upon its ends and engaging with said rack at opposite sides thereof, all substantially as described.

773,565.—Speed Indicating Attachment for Vehicles. Otto F. Hakes, Dunkirk, N. Y. Filed August 1, 1903. Serial No. 167,888. (No model.)

Claim—1. A speed indicator embodying a rotatable casing having a sight opening, and an internal concentric rotatable member visible through the sight opening and capable of being rotatably shifted with respect to the casing, when the rotation reaches a predetermined rate to expose a predetermined portion of the inner member at the sight opening of the casing.

773,575.—Automobile. Alvaro S. Kratz, Springfield, Ohio, assignor of one-half to Paul A. Staley, Springfield, Ohio. Filed February 21, 1903. Serial No. 144,544. (No model.)

Claim—1. The combination of a driving axle and driving wheels, one of said wheels being rigidly connected and the other journaled to said driving axle, a differential adjacent to said journaled driving wheel, a part of which is directly connected thereto, and body supporting corner bearings rigidly connected together, a motor adjacent to said differential and rigidly connected to said corner bearings, body supporting springs rigidly connected to said corner bearings, and a cross spring, whereby the motor is held in a normal working position, substantially as and for the purpose specified.

773,588.—Pneumatic Tire. Charles H. Pierce, Alma, Cal. Filed June 3, 1903. Serial No. 159,968. (No model.)

Claim—The combination with the rim of a vehicle wheel and a pneumatic tire seated therein, of a non-resilient imperforate endless hoop of thick material having an inner groove extending longitudinally of the full length thereof and forming oppositely reduced embracing side portions, the said grooves being of less depth than one-half the diameter of the pneumatic tire and provided with transversely extending corrugations at regular intervals throughout the length thereof and terminating at the edges of the reduced side portions of said hoop, the corrugations preventing the pneumatic tire from slipping longitudinally in the hoop.

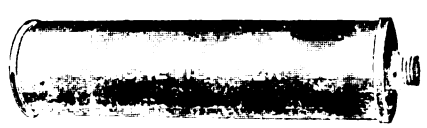
773,633.—Solid Elastic Tires with Fastening Strips. Henry G. Fiske, New York, N. Y., assignor, by mesne assignments, to Morton Trust Company, trustee, a Corporation of New-York. Filed July 1, 1899. Serial No. 722,525. (No model.)

Claim—1. The combination in a wheel, of a tire comprising a body of elastic material circumferentially substantially inexpansible on its base, fabric permanently embodied therein with layers thereof lining the seat of the tire body, a tread portion substantially parallel with base, said tire body being of greater width than thickness, lateral depending flaps composed completely of fabric with all other portions of said fabric permanently vulcanized with the tire body, a felly proper, a band encircling said felly and forming a seat for said tire, lateral plates co-operating with said felly and with said lateral flaps co-operating to clamp said tire, said lateral plates bearing upon said felly on one edge and extending upwardly and outwardly forming a contracted opening whereby said tire proper is laterally secured and a seat portion with tapered sides is afforded for retaining said tire body proper, substantially as and for the purpose described.

773,639.—Vehicle Frame. Norman T. Harrington, Detroit, Mich., assignor to Olds Motor Works, Detroit, Mich., a Corporation of Michigan. Filed July 30, 1904. Serial No. 218,823. (No model.)

Claim—1. A spring vehicle frame comprising a rigid frame, a pair of spring arms secured to said rigid frame intermediate its ends and projecting downward and outward, a cross spring interposed between the ends of said spring arms and said rigid frame, and connections between said cross spring and said rigid frame and spring arms respectively, permitting of a lateral swinging when the springs are flexed.

773,685.—Storage Battery Electrode and Process of Making Same. Elmer A. Sperry, Cleveland, Ohio. Filed January 28, 1904. Serial No. 191,053. (No model.)



Claim—1. The process of producing storage battery electrodes, which consists in precipitating a carbonate of lead from a solution of a lead salt, roasting said carbonate to expel the carbon dioxid and produce a highly porous oxid or oxids of lead, and applying said oxid or oxids to a grid or support, as set forth.

773,686. Storage Battery. Elmer A. Sperry, Cleveland, Ohio. Filed February 11, 1904. Serial No. 193,158. (No model.)

Claim—1. A battery, comprising a vessel, electrodes each having a support leg at one side of said vessel, and a support for said legs independent of said vessel, as set forth.

773,771. Vehicle Wheel. Henry W. Adams, Jr., Chicago, Ill., assignor to Scovill Manufacturing Company, Waterbury, Conn.,

WHITLOCK COOLERS

For 1905.

Experiments are Expensive.

Sometimes they are not only expensive, but fatal. This is especially true in motor car construction. It is, therefore, always on the side of safety and good judgment to adopt those parts which have stood the test of time and have acquired for themselves a reputation based upon actual merit Price is not always the most important consideration.

Therefore, in deciding what cooler you will use for 1905, select one with a reputation.

The Whitlock Cooler has stood the test of time. It has been used for two seasons by the majority of American builders of touring cars. Our experience in this line is now unequalled. Write us about your cooler proposition.

THE WHITLOCK COIL PIPE COMPANY

HARTFORD, CONNECTICUT.

Digitized by Google

a Corporation of Connecticut. Filed March 16, 1904. Serial No. 198,386. (No model.)

Claim—1. A vehicle wheel comprising a suitable felly, a pneumatic tire supported on said felly, a clamping bolt holding the tire in place and extending through the felly, said bolt having relatively large and small diameters, a clamping nut screwed upon the larger diameter of the bolt, and a lock nut screwed upon the smaller diameter of the bolt and bearing against the clamping nut, said lock nut being closed at its outer end and its length being greater than the length of the said smaller diameter of the bolt, and said lock nut being also provided with relatively large and small internal diameters, the relatively small internal diameter being threaded, and the relatively large internal diameter being unthreaded and adapted to extend more or less over the large diameter of the bolt, according to the thickness of the felly, substantially as shown and described.

The YALE $1600

THE YALE WILL MEET THE REQUIREMENTS OF MORE PROSPECTIVE PURCHASERS THAN ANY AUTOMOBILE ON THE MARKET.

You can offer a prospective purchaser more for his money in the Yale than in any other automobile made.

You can offer and guarantee him a degree of Efficiency, Dependability, Luxury and Simplicity of operation to be found only in other cars costing twice as much.

The Yale provides what nine out of ten automobile purchasers want. A roomy, comfortable-riding, beautiful appearing family touring car with power sufficient to overcome all road difficulties and to develop a rate of speed that will satisfy any desire to "ride fast."

Send for new catalogue and investigate the Yale at your first convenience.

ATWOOD MFG. CO.,
Amesbury, Mass.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

OLDSMOBILE

TOURING RUNABOUT.

$750.

HANDSOME, SPEEDY, COMFORTABLE.

A revelation of the possibilities of the single cylinder construction—equipped with famous 7 H. P. Oldsmobile motor—easily makes thirty miles an hour—climbs heavy grades at high speed—its style and elegant appointments meet the requirements of the most fastidious driver—pre-eminently the gentleman's driving car.

We announce to our selling agents and the American public that we can absolutely guarantee prompt delivery on all of our new designs. Our already immense factory facilities, nearly one million square feet of floor space, have been greatly increased to make this possible, and our entire force will work all winter in anticipation of next season's demands. By March 1st we will have over 2,000 completed cars in our warehouses—the largest stock ever gotten together by any manufacturer in the world.

In addition to our new $650 Standard Runabout and our new $950 Light Tonneau Car, we have brought out a new type of Delivery Car, full announcement of which will be made next week.

The Oldsmobile was the ONLY light car awarded a gold medal at the St. Louis Exposition.

WINTON

$4500 $3500 $2500 $1800

The most valuable automobile proposition of the year is the WINTON sales agency.

We promised a surprise in the number and excellence of WINTON offerings for 1905, and we have kept our promise.

A few days ago the question was:—"What will WINTON build?"

Now it is:—"Can I have the WINTON agency?"

WHY?

Because the 1905 products of the house of WINTON represent:—

1—A complete line of four-cylinder cars.

2—A wide range in price, enabling the dealer to secure orders from more purchasers than he can interest in any other line.

3—Substantial quality in every model.

4—Cars simple in construction—practically foolproof—and hence desired by experts and beginners alike.

5—Power greater than the rating.

6—The most accessible vertical motors ever produced.

7—The newest and greatest improvements, not only in motor, but also in carburetor, lubrication, igition, spring suspension, radiation, steering gear, etc., making WINTON cars the genuine automobile sensation of the time.

The whole subject in a few words is this:—

We have studied the wants and needs of automobile buyers.

We have designed our products accordingly.

Motorists are pleased and dealers are enthusiastic.

Is your agency application in? If not, you are giving your competitor an opportunity to handicap you throughout the whole season of 1905.

Our booklet No. 3 tells the whole story of WINTON excellence in brisk and business-like paragraphs. Shall we send you one?

The Winton Motor Carriage Co.

MEMBER A. L. A. M.

CLEVELAND, OHIO, U. S. A.

POLAR COMPOUND.

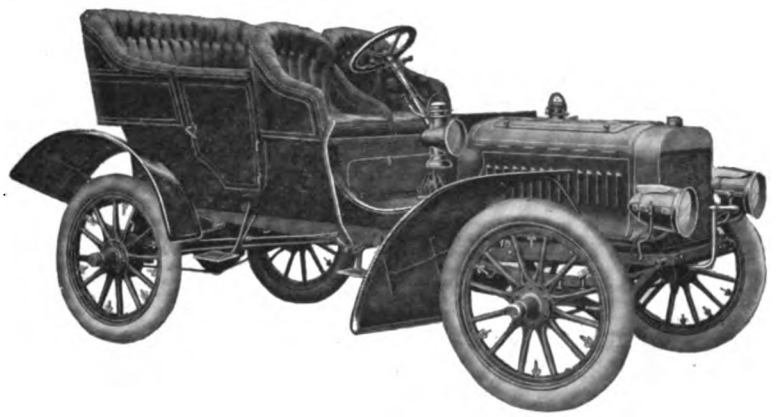
OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.



Sent upon receipt of 6 cents in stamps for postage.

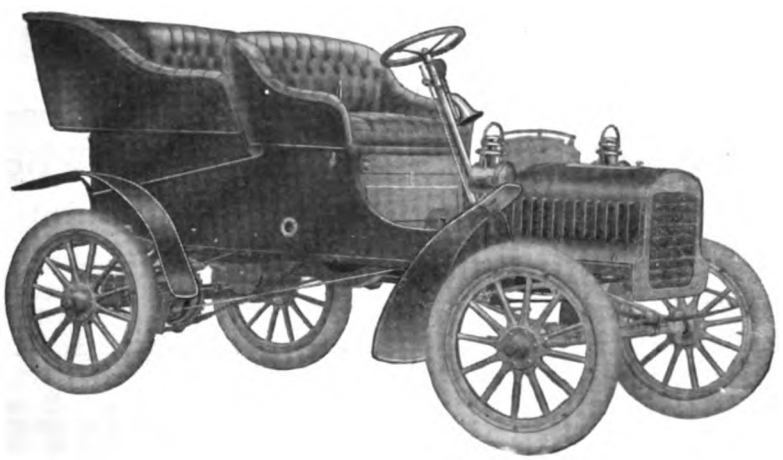
The FORD 1905 Cars



MODEL B. Price, $2000.00.

HENRY FORD'S LATEST AND GREATEST SUCCESS.

Our 1905 Touring Car weighs only 1710 lbs. The 4-cylinder vertical motor develops over 20 horse power, SO THAT THIS CAR HAS MORE POWER FOR ITS WEIGHT THAN ANY CAR IN THE WORLD. This means considerably less wear on the tires and consequently a great saving to the owner. It also means there is ample reserve power for steep grades and sandy roads.

Wheel base, 92 inches; direct drive, with universal coupling; cylinders, 4 x 5, water cooled; automatic oiling device with force feed; large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car place this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horse power, planetary transmission, chain drive, and increased gasoline capacity. The most stylish, low-priced car on the market.

SOME GOOD TERRITORY YET FOR LIVE AGENTS. Write us To-day for Full Information.

THE FORD MOTOR COMPANY, - Detroit, Mich.

KNISELEY BROS.,
Chicago.

MORGAN & WRIGHT, Chicago.

Gentlemen: I have covered over 5,000 miles in my Peerless Touring Car during the past six months. Morgan & Wright Clincher Tires were used, and they are still in the best of condition and good for several thousand miles more. With a tire experience which includes the use of practically all the different makes, I unhesitatingly say that yours are the most reliable and satisfactory tires on the market.

Yours truly, C. T. KNISELEY.

THE PAST.

PHELPS GUARDANT TIME LOCK CO.,
No. 74 Cortland St.,
New York, N. Y.

ACME MOTOR CAR COMPANY, Reading, Pa.

GENTLEMEN—Enclosed please find sixty cents in stamps, for the spring shipped me on Nov. 3rd.

My Car, to date, has given perfect satisfaction. I have taught myself to adjust it throughout, to the carbureter float. I have yet to be convinced that there is as good a Car in the market for the money, and I wish to congratulate you upon your success in designing a Car that is strong throughout,

Yours respectfully,
(Signed) EDWIN S. PHELPS, President.

THE FUTURE.

OUR POLICY WILL NOT CHANGE.

We will continue to give "THE BEST CAR FOR THE MONEY."

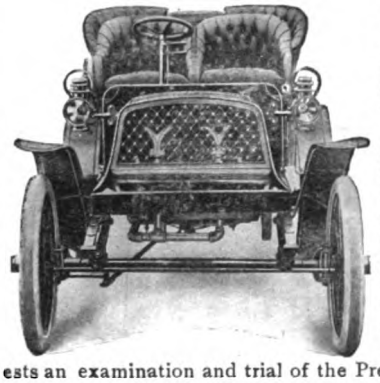
In fact, next year we will give the best car at *any price.*

Our 1905 line will be complete—

RUNABOUTS—
LIGHT TOURING CARS—
HIGH POWERED TOURING CARS—

The best balanced, easiest selling line of Cars in the World.

We want live, reliable dealers to handle our line.



Better write before closing for 1905.

ACME MOTOR CAR COMPANY, Reading, Pa.

PREMIER

"The Quality Car"

DIRECT RADIATION.

If air cooling is not going to win out in 1905 stronger than ever, then we will have about 500 Premier cars on hand at the end of the season. Our 1904 record is clean and open, and 1905 Premiers are of the same general construction as the 1904 car, with an added refinement of details not to be found in any other light car made in America. If you are a possible purchaser of a motor car of quality, you owe your own best interests an examination and trial of the Premier. Think it over.

A few first-class agents wanted in open territory.

Premier Motor Mfg. Co.
INDIANAPOLIS, IND.

YOU CAN SEE YOUR FINISH
WHEN YOU USE

FISK'S AUTO-CAR SOAP

If an automobile is worth anything at all, it's worth keeping clean. Fisk's Auto-Car Soap does it—

Cleans a dirty car as nothing else does, preserves the finish and keeps it looking new with all its original lustre. Re-orders from those who have tried it prove its worth.

Put up in 5 lb. air-tight tin pails. Price $1.00. (Express prepaid to points as far West as and including Chicago, Ill.) Also put up in barrels and half barrels.

A necessity to every individual owner.

A big and profitable seller to all jobbers, dealers and garages.

OUR PROPOSITION IS INTERESTING.

Send us a trial order.

FISK MFG. CO., Springfield, Mass.

KNOX WATERLESS COMMERCIAL CARS

A CONVINCING LETTER.

BOARD OF DIRECTORS,
BRINKS C. C. EXPRESS CO., City.

Gentlemen:—Below please find report of the Waterless Knox Gasolene Express wagon that we have had in use for 12 days and 12 nights. Eighteen hours divided into two shifts of 9 hours each, covering 150 miles per day of two shifts between Evanston, Oak Park and Woodlawn, and making between 6 and 8 trips during that time, not missing a schedule trip except one trip of two hours, when an electric car ran into the auto, dishing one wheel.

The machine used 20 gallons of gasolene a day of two shifts, or about one gallon for each hour run. When we put this machine on we laid off three wagons, twelve horses, and they have been off during that time, the horses being used elsewhere in the business. We used two of the men on the auto and dispensed with the services of the other man.

By an investment of $2,450 for this Knox machine we can improve deliveries in our business, get better service and save the cost of feeding above horses, one man's wages and the investment in the future of three wagons, harness, etc. We recommend the purchase of said auto. Respectfully submitted, A. P. BRINK, General Mgr.

Superintendent, W. B. WYNE.

Races and other competitions which are confined to stock cars can not failt to have more inteiest for motorists than any other motor competitions. The reliability of the WHITE Steam Car has been so repeatedly proven in official trials, both at home and abroad, that is has become a generally accepted fact all over the motor world that the WHITE is a really-reliable motor car. The speed of the WHITE is now frequently claiming attention, and recent victories of the WHITE Cars in stock races as above all point one way—to the speed of the WHITE Steam Cars on the road and on the track.

Rambler

SURREY, TYPE ONE. 1905 Model.

2 CYLINDERS, 16 H.P., $1350. IMMEDIATE DELIVERY.

Thursday afternoon, October 13. Arthur Gardiner, whose name was formerly well known on the cycle track, and who now is final tester of every RAMBLER car made, drove the writer in a new Surrey, Type One, for a twenty mile run about Kenosha. The country is perfectly flat, and the black soil makes poor roads, deeply rutted, so that this high speed run furnished no hill climbing, but plenty of spring and power testing, as a narrow, deep rut made by farm wagons in soft roads pinches pneumatic tires, and tests the springing by side crooks. Part of the time the car had four passengers and part of the time it was on very bad, soft, muddy, uneven roads, always riding very smoothly, without the slightest tremble of the free front ends of the mud guards, which is most convincing proof of entire absence of vibration, and always with abundant power to spare. The car is as still as it should be, silencing perfect, no bouncing, easy side swing, and prompt response in every particular of control.—HUGH DOLNAR, page 86, *et. seq.* *Cycle and Automobile Trade Journal*, November, 1904.

We shall be pleased to send you a copy of THE RAMBLER MAGAZINE, and other printed matter, free, upon request.

DIAMOND ACQUIRES PATENT

And the Big Akron Rubber Company Will Promptly Produce Turnbuckle Tires.

What may or may not be a sign of the times, but what is undoubtedly full of suggestion, came to light this week, when it was learned that the Diamond Rubber Co. had obtained control of the Sherman patent, which covers a turnbuckle tire of the perfected Dunlop principle.

The patent, which was taken out by the Sherman brothers, a couple of physicians in Cleveland, Ohio, is said to be a basic one.

It is understood that the Diamond Rubber Co. will immediately add a tire of that type to their product, which is in line with their progressive policy of placing themselves in a position to meet any demand that may arise, or may have arisen.

The Diamond turnbuckle tire, it is stated, will be made interchangeable with the Dunlop turnbuckle rim.

Last of the Gasmobile.

Almost like a voice from the grave comes the announcement that Vice-Chancellor Stevens has directed Henry C. Cryder, receiver of the Automobile Co. of America, to make a final distribution of the assets of the insolvent corporation among its creditors. The sum to be distributed equals 2 per cent of the total liabilities and makes the total distribution among the creditors equal to 17 per cent of their claims.

The plant of the corporation at Marion, N. J., was sold to Richard C. Currier early last spring. The concern became embarrassed several years ago.

Wolverine Flirts With Terre Haute.

The Wolverine Motor Car Co., of Detroit, Mich., is dallying with the town of Fort Wayne, Ind., and thinks highly of the place as a location for a manufacturing establishment. Representatives of the concern were in Fort Wayne last week, seeking to interest local capitalists with a view to enlarging its operations and removing there.

Bankers Relinquish Two Stores.

While not entirely unexpected in the trade, it having been whispered that something startling was about to happen, the announcement that both the New York and Philadelphia stores of the Banker Bros. Co. will be closed will undoubtedly cause considerable surprise. The move is to be made at once, and the business will be concentrated at the Pittsburg establishment, which will continue to be managed by Arthur L. Banker.

The establishments to be closed are of an unusually pretentious character. The New York place is located on Thirty-eighth street, and is a very large and elaborately fitted up building. It was built especially for the sale and storage of automobiles, and was opened by Banker Bros. nearly two years ago. C. G. Wridgway was in charge as manager. The Philadelphia store was located on North Broad street, and was also a handsome and commodious establishment. Geo. A. Banker came from Pittsburg to assume charge of it.

Olds Departmentizes Business.

To facilitate the transaction of business the Olds Motor Works have divided the country into two departments, Eastern and Western, respectively, the Mississippi River being the dividing line. W. E. Stokes has been named as manager of the former, and S. S. Olds of the latter. Other department heads have been designated, as follows: Traffic department, J. J. Brady; railway inspection car department, R. T. Yates; repair department, C. E. Warner; accounting department, C. D. Hastings, and advertising department, Burton Parker.

Fisk Opens in New York.

The Fisk Rubber Co. is this week establishing a New York branch at 754-756 Seventh avenue—in the heart of the uptown automobile district. J. W. Bowman, hitherto in charge of the sales department at the factory in Chicopee Falls, will locate at the New York branch as general Eastern sales manager.

Twyman Becomes Sales Manager.

B. W. Twyman has been appointed sales manager of the Logan Construction Co., Chillicothe, Ohio. He was for a number of years connected with the Waltham Mfg. Co.

NEW YORK ALLOTMENTS

Two Hundred and Twelve Applicants Provided For—Where Their Exhibits Will be Located.

While knowledge that the demand for space at the New York show had required that each applicant be content with less room than he desired and then left a number of applicants unprovided for afforded a well defined idea of the extent of the exhibition of 1905, the list of exhibitors, which was made public this week, serves to more sharply outline the increase in the industry and in the immensity of the show.

In all, space has been apportioned to 212 applicants, of whom 104 are makers of complete vehicles. At the 1904 show there were 155 exhibitors of whom 89 displayed complete cars, and in 1903 the proportion was 76 out of a total of 143.

Those who obtained space and the spaces they obtained were as follows:

Jailed for Entering His Own Store.

Arrested for breaking into his own store, H. T. Eichenberger, secretary of the Pacific States Automobile Co., San Francisco, Cal., will fight to clear himself of the technical charge of burglary. Eichenberger purposely committed the offence with the object of testing the right of Attorney C. A. Low to put a padlock on the door of the store.

It seems that the company had borrowed $600 from E. T. Beck, a client of Low, and, so it is claimed, turned over its property to secure payment. The padlock was put on the door by Low, who had heard that Eichenberger was going to remove the cars in the store. Low notified the policemen to arrest any one who should attempt to break the padlock and enter the store.

Eichenberger says he was instructed by President Woolsey to break off the padlock and he got a blacksmith's hammer and did so, effecting an entrance. Just then Policeman Hook made his appearance and placed him under arrest. He says there are eight automobiles in the store. He was released on $1,000 bonds.

The Week's Incorporations.

Detroit, Mich.—Hammer Motor Co., under Michigan laws, with $10,000 capital.

Detroit, Mich.—Wayne Automobile Co., under Michigan laws, with $300,000 capital.

Chicago, Ill.—Tincher Motor Car Co., under Illinois laws, with $200,000 capital; to manufacture motor cars. Corporators—T. L. Tincher, M. B. Louis and M. A. Mayo.

Rochester, N. Y.—Seneca Automobile Co., under New York laws, with $10,000 capital; to manufacture motors. Corporators—F. H. Clum, G. W. Robeson and A. H. Dalzell.

New York, N. Y.—New York Observation Automobile Co., under New York laws, with $1,000 capital. Directors—M. B. Beckman, S. M. Fischer and A. D. Beckman, New York.

Chicago, Ill.—Bennett-Bird Co., under Illinois laws, with $10,000 capital; to manufacture automobiles and motors. Corporators—Arthur G. Bennett, George H. Bird and Mark Breedon, jr.

New York, N. Y.—International Auto Sightseeing Co., under New York laws, with $15,000 capital. Directors—Martin Oneill Galvin, Florence J. Sullivan and Thomas T. Graham, New York.

Waverley, N. J.—Hartford Suspension Co., under New York laws, with $100,000 capital; to make automobile appliances. Directors—E. V. Hartford, J. A. Hartford and A. G. Huffman, New York.

Hiland's New Officers and Quarters.

The salesroom and garage erected by the newly formed Hiland Automobile Co., of Pittsburg, Pa., is expected to be ready for occupancy this week. It is located at Baum and Beatty streets, and is a brick structure of substantial construction and with plenty of light.

Officers have been elected by the company as follows:

President, Dr. John A. Hawkins; treasurer, Dr. George A. Urling, and secretary, F. W. Anderson. Arrangements have been made to handle the Autocar line as a leader.

To Make Automobiles and Valves.

The D. T. Williams Valve Co. has been organized at Cincinnati to engage in the manufacture of automobiles and valves. A three-story building at Eggleston avenue and Broadway has been leased for a term of years, and will be utilized as a manufacturing plant. It contains 18,000 feet of floor space.

Penrose Goes With Fisk.

Morris Penrose has been designated manager of the new branch which the Fisk Rubber Co. will open in Cleveland, Ohio, early next month. He formerly represented the International A. & V. Tire Co. in Boston, and previously was for years connected with the Hartford Rubber Works Co.

J. P. Schneider & Co., of Detroit, Mich., have regained the agency for the Autocar. They had it a year ago and lost it.

BOOKED FOR CHICAGO

Those Who Obtained Space at Western Show—Fifteen Applicants Crowded Out.

After paring the applications some 30 per cent each, so great was the demand for space at the Chicago show, February 4-11, that some fifteen would-be exhibitors were "left out in the cold"—five of them makers of cars. They are on the "waiting list," and will be taken care of only in the event of vacancies occurring.

In all there will be about 170 exhibitors at Chicago, of whom 80 will exhibit cars and 90 parts and accessories. The space available on the main floor is 39,509 feet, all of which will be devoted to complete cars.

The space in the gallery was allotted by a committee representing the Motor and Accessory Manufacturers. All of it was taken by members, so that it was necessary to abandon the restaurant, which has heretofore been on the second floor of the annex, for the benefit of non-members. Of the automobile exhibitors, an even score have never before shown at Chicago.

The notices of allotment were sent out on Saturday last for the main floor space, and the remainder on Tuesday. They will not be made public until acceptances are received.

The complete list follows:

AUTOMOBILES.

Acme Motor Car Co., Apperson Bros. Auto Co., Auburn Automobile Co., Austin Automobile Co., Autocar Co.

A. C. Banker Co., Bartholomew Co., C. H. Blomstrom Motor Co., Buick Motor Car Co., Burtt Mfg. Co.

Cadillac Automobile Co., Chicago Automobile & Mfg. Co., Chicago Motocycle Co., Coldwell Lawn Mower Co., Columbus Motor Vehicle Co., Covert Motor Vehicle Co., Crest Mfg. Co.

John L. Dolson & Sons, Duryea Power Co.

Electric Vehicle Co., Elmore Mfg. Co.

Ford Motor Co., H. H. Franklin Mfg. Co.

Haggmann & Hammerly, Haynes-Apperson Co., Holsman Automobile Co.

Jackson Automobile Co., Thomas B. Jeffery & Co.

Kirk Mfg. Co., Knox Automobile Co.

Locomobile Co. of America.

Marble-Swift Automobile Co., Marion Motor Car Co., Maxwell-Briscoe Motor Co., Mead Cycle Co., Michigan Automobile Co., Mitchell Motor Car Co., Model Gas Engine Works.

National Motor Vehicle Co., Northern Manufacturing Co.

Olds Motor Works.

Packard Motor Car Co., Peerless Motor Car Co., George N. Pierce Co., Pierce Engine Co., Pope Motor Car Co., Premier Motor Mfg. Co., Pungs-Finch Automobile and Gas Engine Co.

Regas Automobile Co., Reliance Motor Car Co., Reo Car Co., Royal Automobile Co., Royal Motor Car Co.

Simplicities Automobile Co., Sommer Motor Co., Standard Wheel Co., F. B. Stearns Co., J. Stevens Arms and Tool Co., St. Louis Motor Carriage Co., Stoddard Mfg. Co., Studebaker Bros. Mfg. Co.

E. R. Thomas Motor Co., Tincher Motor Co.

Union Automobile Co.

Vehicle Equipment Co.

Waltham Mfg. Co., Welch Motor Car Co., White Sewing Machine Co., Winton Motor Carriage Co., Woods Motor Vehicle Co., Worthington Automobile Co.

PARTS AND ACCESSORIES.

American Roller Bearing Co., Aurora Automatic Machinery Co., Autocoil Co., Badger Brass Mfg. Co., Baldwin Chain and Mfg. Co., Beckley-Ralston Co., S. F. Bowser & Co., Inc., Brennan Mfg. Co., Briscoe Mfg. Co., W. H. Brown, Brown-Lipe Gear Co., Byrne, Kingston & Co., Chicago Battery Co., Chicago Rawhide Mfg. Co., Chicago Storage Battery Co., Continental Caoutchouc Co., Cullman Wheel Co., Dayton Electrical Mfg. Co., Detroit Steel Products Co., The Diamond Rubber Co., R. E. Dietz Co., Jos. Dixon Crucible Co., Dow Portable Electric Co., A. L. Dyke Automobile Supply Co., Electric Contract Co., Excelsior Supply Co., Fawkes Rubber Co., Federal Mfg. Co., Firestone Tire and Rubber Co., Fisk Rubber Co.

G & J Tire Co., B. F. Goodrich Co., Goodyear Tire and Rubber Co., Gray & Davis, Greene, Tweed & Co., R. E. Hardy Co., Hartford Rubber Works Co., Hendee Mfg. Co., Herz & Co., Hine-Watt Mfg. Co., William Hjorth & Co., Hyatt Roller Bearing Co., Imperial Wheel Co., India Rubber Co., Chas. Kaestner Mfg. Co., C. P. Kimball & Co., McGichan Odometer and Mfg. Co., The Miller-Knoblock Electric Mfg. Co., Morgan & Wright, Motor Car Supply Co., Motsinger Device Mfg. Co., National Carbon Co., Oliver Mfg. Co., Pantasote Co., Pennsylvania Rubber Co., Pope Mfg. Co., Pneumatic Tire Protector Co.

Remy Electric Co., William Roche, Rose Mfg. Co., Shelby Steel Tube Co., C. F. Splitdorf, Sprague Umbrella Lamp Co., Standard Carriage Lamp Co., Standard Oil Co., Standard Welding Co., Steel Ball Co., Swinehart Clincher Tire and Rubber Co., Timken Roller Bearing Axle Co., The Tokheim Mfg. Co., Twentieth Century Mfg. Co., The Veeder Mfg. Co., Vesta Accumulator Co., Warner Gear Co., Warner Instrument Co., Webb Co., Whiteley Steel Co., Whitney Mfg. Co., E. J. Willis Co., Wray Pump and Register Co.

Woman Attaches Grout Exhibit.

Growing out of a sale made through an exhibit at St. Louis, Grout Bros., Orange, Mass., find themselves with a lawsuit on their hands.

The plaintiff is Miss Helen Walker, of St. Louis, who last week filed an attachment suit in the Circuit Court against Grout Bros. for $700. She alleges that she purchased for $700 on July 15 last an automobile from the company, which has an exhibit at the World's Fair. She states that it was guaranteed that the automobile was not difficult to handle, and that a lady could operate it. This was not the case, and the machine was changed for another one on September 21, it is stated.

The second machine, she charges, did not give satisfaction, and she demanded the return of her money, offering to return the automobile.

The Sheriff was instructed to levy upon the automobile, which is in Miss Walker's possession, and the company's World's Fair exhibit.

Small Fire in Detroit.

Fire originating in the office of the Wayne Automobile Supply Co., Detroit, Mich., last week inflicted a loss of about $200. It was put out before it reached the main building.

BUICK GETS LICENSE

Big Michigan Company Joins Selden Fold and Will Market Two Notable Cars.

Although it may not be realized by the rank and file of the trade, probably the most notable accession the industry has had in recent years is the enlarged Buick Motor Co., now of Flint and Jackson, Mich. Both in capital, largely increased facilities and in the accession of men whose names are synonymous with success in the big Michigan centres, the Buick Motor Co. are richly endowed.

As their plans gradually unfold, it will be seen that they are on a large scale, befitting the new resources of the company. It became known this week that they had acquired the Selden license, held by the Pope-Robinson Co., of Hyde Park, Mass., and they will therefore come before the trade as a full fledged member of the Association of Licensed Automobile Manufacturers. W. C. Durant, the head of the big company, has been in New York for several days, during which the deal was negotiated.

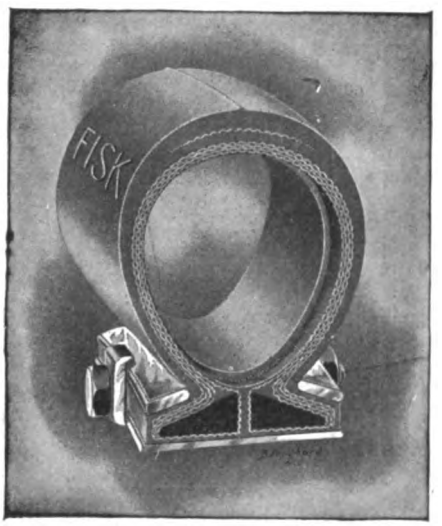
The models to be marketed by the Buick Motor Co. will be two in number—one a touring car with a double-cylinder opposed motor 4½ by 5, developing 22 horsepower, with bevel gear drive and side entrance, which will list at $1,200; the other a two-cylinder opposed runabout of 16 horsepower, motor mounted in front, and listing at $750.

An idea of the scale of manufacturing which will be carried out by the Buick company may be obtained from the fact that it is the intention to utilize as much as may be necessary of the immense plants controlled by the Durant-Dort carriage industries, widely known to every one in the carriage trade. These plants comprise about a dozen in number and are superbly equipped and adapted to the manufacture of automobiles and all their component parts.

The Durant-Dort industries were planned on a large scale, and comprise factories for making axles, drop forgings, wheels, springs, bodies and so forth, and, in fact, everything in the line of metal and wood parts.

The decision of Mr. Durant and his associates to enter the automobile field was made only after a careful investigation and a close watch of the industry for the past few years. They only awaited the time when it was felt that the experimental period of the automobile was over and it had taken its rightful place. Competent engineers were then secured, and on their report a controlling interest in the Buick Motor Co. was acquired.

Blomstrom Enlarging Plant.



A $10,000 addition is being made to the plant of the C. H. Blomstrom Motor Car Co. of Detroit, Mich. The building will have a frontage of 100 feet, making the total frontage 350 feet.

NEW YORK, NOVEMBER 24, 1904.

Cowardice and Worse.

The man who, having caused an accident—whether it be in an automobile or any other vehicle—does not stop to learn the result, is a contemptible coward. The fellow who, having caused an accident, stops long enough to drag the unconscious victim to the side of the road and permits him to lay there, perchance to die, does not deserve to be termed a man—he is a cowardly pup. There can be not even a spark of fellow feeling for such a brute. He lacks even the first instinct of real manhood.

Such a thing attired in man's clothing committed such an offence on Friday night last on a road near New York. His victim, an aged man, was run into and knocked from his wagon and was then dragged to one side of the road, covered with a blanket and left there untended until he was discovered at daylight.

The suspected miscreant, a chauffeur on a midnight lark, is under arrest. But whether chauffeur or millionaire proves to be guilty, he merits no semblance of sympathy. He should be given the limit of the law's punishment; and even that will be inadequate. If there is any way in which the automobile organizations can become parties to the prosecution, they might prove their good faith with the public by doing so.

The accident, which happily will not prove fatal, should serve one good purpose. It should further the passage of the universal lamp law to which the Automobile Club of America has commited itself and which others before it had striven to have enacted.

Oil Drippings on Asphalt.

On a prominent Detroit street the other day several fire engine horses slipped and fell, while responding to an alarm. It is charged that the falls were due to the street being slippery from the dropping of oil and grease from automobiles; although others say it was frost that made the asphalt slippery. In other cities the same charge has been made against automobiles, viz., that they drop oil and grease on asphalt pavement and thus injure it, either temporarily, as by rendering it slippery, or permanently by rotting it. Buffalo talks of adopting remedial measures, and Chicago has an ordinance pending with a similar object in view.

That no case against the automobile has yet been established is quite true. It is doubtful whether one ever will be. No proof has ever been produced that oil or grease will rot asphalt, and we very much doubt that it does. A close examination of Thirty-eighth street between Broadway and Seventh avenue—New York's Automobile Row—leads us to this conclusion, for the asphalt pavement is apparently as sound as the day it was laid. Yet there is not a street in the world that is more given over to automobile traffic than it. All day long cars stand in double rows in front of the automobile stores which monopolize almost the entire block, and demonstrating cars pass over it by hundreds every day. The pavement is pretty well covered with grease, as it is never removed, but it does not appear to have any bad effect on the asphalt itself.

But whether it does or not this is begging the question. Suppose oil and grease did rot the pavement and cause it to need repair from time to time, what then? Is that any reason why repressive measures should be adopted against automobiles? The mere fact that they are used does not absolve the authorities from the duty of cleaning the streets. If automobiles drip oil, let the department of street cleaning remove the oil, just as they sweep up horse droppings and other deleterious substances from all streets. This may not be an easy job, for, of course, water alone will not remove the accumulation of oil and grease; but a satisfactory method can be devised if the attempt is made. A cheap and easily applied solvent is not undiscoverable, and it is, or will be, the duty of the authorities to discover one. Then the work of cleaning can be proceeded with, just as the removal of horse droppings is undertaken now.

If the horse is definitely banished from city streets and the motor vehicle reigns supreme there will be necessitated an entirely different system of cleaning. That the need of a cleaning department will no longer exist is an absurd supposition; its labor will be tremendously decreased, but there will still be work for it. As it is viewed now in some quarters, the withdrawal of the horse from streets like Thirty-eighth street carries with it the withdrawal of the street cleaners. Anything more ridiculous than this it would not be easy to imagine. Streets should be cleaned, whether they are encumbered with horse droppings, rubbish or automobile drippings.

The Matter of Repairmen.

Within the space of a few years swarms of repair shops have sprung up all over the country. Like Topsy, many of them "just growed," their proprietors frequently acquiring their brief amount of knowledge of repairing after they embarked in the business. Naturally, therefore, they have many shortcomings, and they make many mistakes. Experience brings them knowledge, and in course of time they become fairly proficient in a rule of thumb fashion, and are able to successfully tackle all but the most difficult and intricate jobs.

For a considerable number of years the number of such shops is certain to increase. No piece of mechanism can continue to be used without requiring repairs, and the increasing number of automobiles, combined with the seeming prosperity of the repair shops, will lure into the field a large number of men who see in the new industry a field for the display of their talents. Whether or not they possess the qualifications necessary to win success is a question of overshadowing interest and importance.

Digitized by Google

As is pretty well known, the fact that a man is an expert machinist does not necessarily qualify him to make a success of automobile repairing. Contrariwise, a man may be a good automobile repairer and only a fair machinist. Knowledge of the construction and peculiarities of a car sometimes count for more than a deft manipulation of metals. Still, a knowledge of the latter constitutes no drawback, and frequently it is a distinct advantage. Such jobs as, for example, reboring a cylinder or straightening a bent shaft in a lathe, are better placed in the hands of a full fledged machinist. A more workmanlike job is certain to result than if it were placed in the hands of a man of all work.

The trouble is to find such men. They usually have good, steady positions, and it would require an inducement greater than most repair shops can afford to make to cause them to relinquish them. So great is the difficulty that many shop proprietors give up the effort to obtain them and take instead the class of help that is available i. e., the handy men, many of whom are the typical jack of all trades and masters of none. Yet that does not prevent their doing some classes of work quite as well as the best machinist that ever ran a lathe.

The only question is whether machinists will be induced to become automobile repair men or handy men be taught to do work equal to that of machinists.

The Chauffeur Problem.

The "chauffeur problem" has always been with us. It is akin to womankind's "servant girl problem." The increasing number of midnight accidents, due to chauffeurs out for a lark in their employers' cars and without their employers' permission, is evidence that this newest species of hired man is still at his old tricks and that the problem is not near a solution. It implies that the employers' system of "keeping tabs" on their "men" or cars, or both, is lacking, or that the garage in which the cars are stored are unworthy of the patronage bestowed on them.

The suggestion that the chauffeur's license be revoked in the event of trouble will not prove an effective remedy. He has but to cross a river or a State line to find employment elsewhere. The solution of the problem, if a solution is possible, rests with the employers. They should require references, and investigate the references before engaging a driver, and, if need, require weekly reports from the garage owner concerning the comings and goings of their cars. It should be made difficult for the discredited chauffeur to find employment and for the discredited garage to obtain customers.

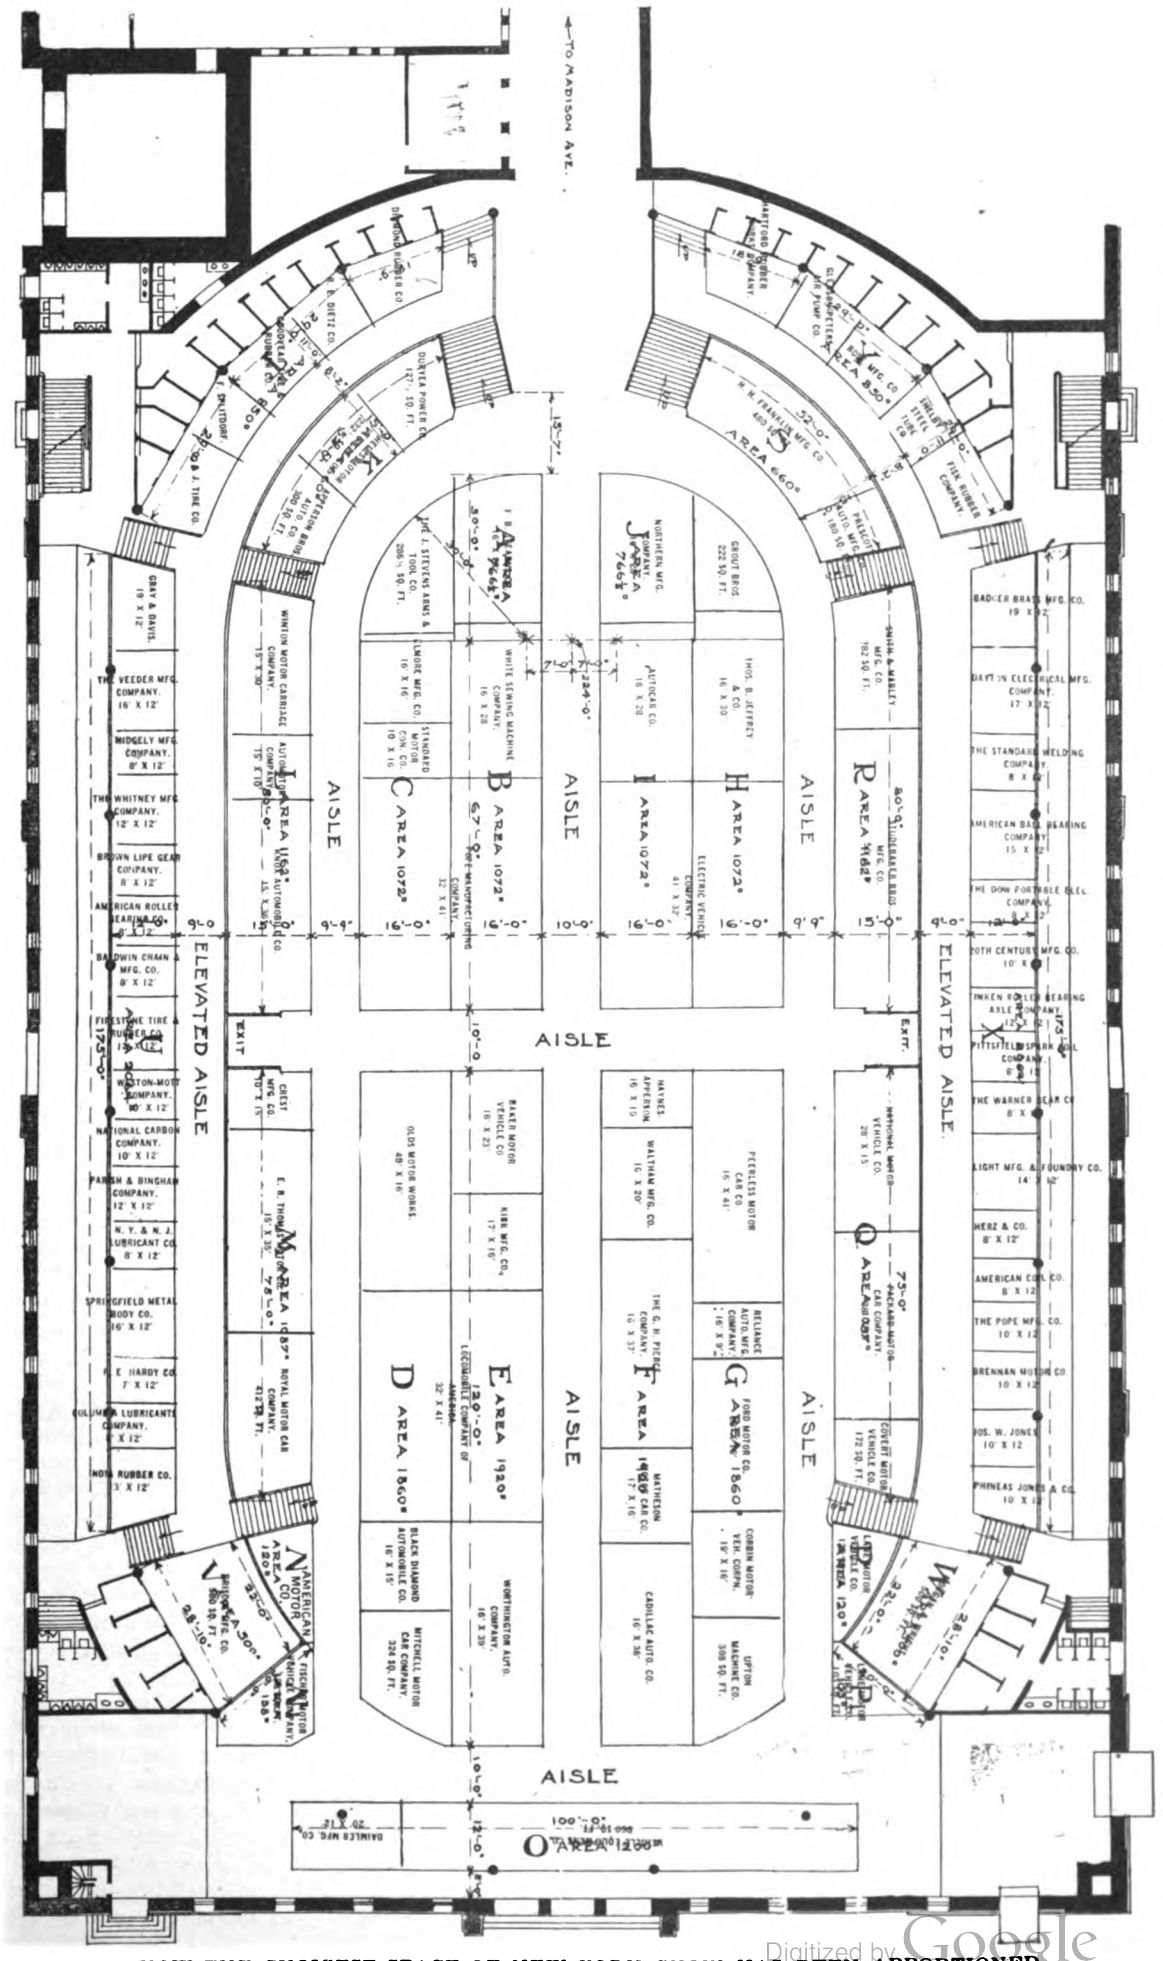
Fall Sales.

In marked contrast to November of last year dealers are making both sales and deliveries of new models. There is no great volume of such business, and some dealers have as yet had no shipments from the factories; but most of them have been getting cars by ones and twos and threes, and have little difficulty in finding purchasers who will take them and put them into commission at once.

The continued mild and fine weather has had a great deal to do with this tendency to make early purchases. The temptation to buy is much less when roads are bad, temperatures low and winds biting than when glorious fall weather prevails and reaches out an alluring, even a compelling, hand. The new model might be displayed ever so attractively on the salesroom floor, and it would never feaze some motorists; they would wait until the open road calls them, and only then conclude their bargain by entering into actual possession of the car.

The early arrival of 1905 cars is also proving a godsend to dealers who are handling lines that they sold this and previous years, and especially where such cars have given satisfaction. The motorist who experienced trouble during the last season, and is of the opinion that the car and not himself was to blame, may be persuaded to invest in a new model of the same make, but only after much labor and after he has seen enough of the running of a car to convince him that it really has been improved and the defects of the past eradicated. No amount of coaxing will avail to bring him to the point of definitely committing himself now by purchasing and putting into service one of the new models. As he would put it, he has cut his eyeteeth, and next time will look before he leaps, be sure before he buys.

An almost equally hopeless task is that of convincing a customer that it would be wise for him to accept delivery of a new make of car. Circumstances may have arisen that render it advisable, or even necessary, for the dealer to switch him over from one make to another. The customer may be willing to take the dealer's word that the car is, like Caesar's wife, above suspicion and all that it should be. But he prefers to wait until spring before taking the plunge. Then the fever will be on him and he will have had an opportunity to examine other cars and compare them with the one he has decided to buy; but until then he prefers to remain free, or bound only so far as is implied by the placing of an order, with, perhaps, the deposit of a portion of the purchase money. And this is the case even when he has no intention of backing out of his bargain.



But the customer who merely proposes to change a 1904 model for a 1905 one is not so finicky. All he wants is to be assured that he is really getting a 1905 model, and he will consummate the bargain without hesitation. The dealer who can give him this assurance, and who is receiving even small sized shipments, is doing some business, even if winter is almost on us.

Like the poor, the dirty, ill kept garage is always with us. Animadversions in plenty have been levelled at them, and the necessity of maintaining establishments where people of refinement and breeding can enter without entertaining feelings of repulsion or disgust pointed out. And garage keepers listen and assent or turn a deaf ear as they please, with a like result in either case—an indifference to and disregard of the friendly remonstrance or advice.

Such places are distinguishable at a glance. The reek of tobacco smoke and stale oil meets one at the door, and is reinforced by the sight of oil stained floors, dirty cars and a litter of articles that should be kept out of view. There are no chairs or other places in which to sit while waiting for a car to be made ready. You have to stand and close your eyes and ears to the repugnant spectacle as best you can.

The statistics supplied by the Automobile Club of America, proving that violation of the speed law by horse drawn vehicles is common, is interesting and is valuable chiefly because it specifically confirms a matter of common belief. It is doubtful that it will serve its purpose. When, as we have several times instanced, horsemen, cyclists and automobilists alike frankly admitted at a public hearing in the New York City Hall that a violation of the legal rate of speed was the rule rather than the exception on the part of each of their respective classes of travel, and pleaded for a law that was really possible of obedience, their plea was resolutely opposed by even such an intelligent and respectable body of citizens as comprise the West End Improvement Association. When such men object to the enactment of an honest law there is small hope of betterment.

FERRY OWNERS FILE REPLY

No Spark in the Automobile While Boat was in Motion the Burden of Response.

No especially new points are brought out in the answer of the Brooklyn Ferry Co. to the libel filed against the steamer Texas by United States District Attorney Burnett on November 7. The answer was drawn up by Herbert Green, of Wilcox & Green, No. 1 Broadway, and was filed on November 19. It asks for the dismissal of the libel on two grounds, first, that there was no fire in the machine while it was being transported, and, second, that the gasolene in the tank of the machine was not carried as freight. Stress is laid upon the fact that the engine was stopped before the Texas left her slip, and that it was not started again until the boat was made fast to the slip at the foot of Broadway, Brooklyn.

The first part of the answer admits, in legal phrasecology, of the truth of the first five parts of the libel. These were devoted to a recital that the Texas is within the court's jurisdiction, carried passengers in the East River, and was owned and operated by the Brooklyn Ferry Co. The fourth part of the libel quoted the law on the subject, and the fifth told that the law was in force on October 14.

The sixth part of the answer is as follows:

"Denies that the gasolene mentioned in the sixth article of the libel was carried by the ferryboat Texas as freight; also denies that there was a fire in the motor vehicle therein mentioned which was not extinguished before the vehicle entered the vessel on the occasion referred to in said article; denies that a fire was relighted in said vehicle before it left the vessel at the foot of Broadway, Brooklyn, and also denies that there was any fire whatsoever in said vehicle on said occasion; and admits the remaining allegations contained in the sixth article of the libel."

The seventh and eighth parts deny the allegations contained in the correspondingly numbered parts of the libel. The ninth part is as follows:

Further answering, claimant alleges, upon information and belief, as a distinct and separate defence:

"Section 4,472 of the Revised Statutes, which incorporated an act of Congress of February 28, 1871, originally contained no reference whatsoever to automobiles or motor vehicles, but by an amendment which became a law February 20, 1901, the following was added thereto, which appears in said section of the Revised Statutes as set forth at length in article fourth of the libel:

" 'Nothing in the foregoing or following sections of this act shall prohibit the transportation by steam vessels of gasolene or any of the products of petroleum when carried by motor vehicles (commonly known as automobiles) using the same as a source of motive power; Provided, however, that all fire, if any, in such vehicles or automobiles be extinguished before entering the said vessel, and that the same be not relighted until after said vehicle shall have left the same: Provided, further, that any owner, master, agent or other person having charge of passenger steam vessels shall have the right to refuse to transport automobile vehicles the tanks of which contain gasolene, naphtha or other dangerous burning fluids.'

"At the time said amendment became a law automobiles or motor vehicles using gasolene as a source of motive power, commonly contained a fire giving forth a continuous flame which was essential to the creation of the power used to propel such vehicles.

"The motor vehicle or automobile numbered 11,119, referred to in the libel, was equipped with a securely closed metal tank containing not more than ten gallons of gasolene, which was used as a source of motive power for the propulsion of the vehicle. The tank was securely affixed to the rear of the vehicle. (The method of producing the power required to propel a gasolene automobile is then described.)

"On the occasion mentioned in the libel, and while the ferryboat lay in its slip at East Twenty-third street, Manhattana, made fast to the ferry bridge, the vehicle entered the ferryboat, and traversed the length thereof in the horse gangway, under its own power, produced as hereinbefore described, and then, and before the ferryboat started on her trip, the said electric current was instantly broken and said sparking ceased. Said current remained broken, and said sparking suspended, throughout the trip of the ferryboat and until she was made fast to the bridge in her slip at the foot of Broadway, Brooklyn, at the termination of the trip, when said current was again made, and said sparking resumed, for the purpose of permitting the vehicle to leave the ferryboat under its own power."

The answer winds up with a petition that the libel be dismissed with costs. It is sworn to by Joseph J. O'Donohue, jr., president of the Brooklyn Ferry Co. The case will be called in the U. S. District Court for the Southern District of New York on December 6, at which time a day will be set for its trial.

Discussed Anti-Freezing Solutions.

Anti-freezing mixtures occupied the attention of the members of the Milwaukee Automobile Club last week, when they held the first of a series of winter meetings, at which popular subjects will be discussed.

Dr. Louis Fuldner read a paper, discussing various solutions, and a general expression of opinion followed. The proper solution of calcium chloride, according to the experience of those who advocated its use, is four pounds to a gallon of water. This solution will not freeze above a temperature of 30 degrees, and does not injure the tubing. A 60 per cent solution of pure glycerine stood next in favor.

Experiments will be tried by the members to determine the relative value of solutions and the proper percentages to use.

TILTING AT AIR SHIPS

None in New York, but that Does Not Worry These Tilted "Democratic" Motorists.

That unique organization, the New York Motor Club, in which *"democratic" motorists form the backbone of the membership, is progressing. Its last meeting, instead of being held in the drink dispensary of the hotel in which the previous gatherings occurred, was held in the office of a brokerage firm which is on the street floor. (*"Motorists" who do not own motors.)

Although most of the members actively concerned with the club style themselves newspaper men, they left word with the hotel clerk that no newspaper men be admitted to the meeting. It is understood that the former six-day professional bicycle rider, who is most active in the promotion of the club, is very much excited and exercised over the failure of some of the papers to take the organization seriously.

The purpose of the meeting was supposed to be the adoption of a constitution and by-laws, but the handful present killed time by discussing whether or no owners of airships should be admitted to membership. The discussion provoked a great deal of amusement and some opposition, but Sidney B. Bowman carried the day when he remarked that to include "hot air" ships would be the means of obtaining a lot of advertising. This idea prevailed, and all of the very many hundreds of New Yorkers who keep such craft in their hall bedrooms will doubtless apply for membership. It is also stated that resident membership will be limited to Greater New York. Incidentally, the six-day professional bicyclist is not a resident of New York. Non-resident dues, of course, will be much cheaper than those of resident members.

For some reason or other the meeting deemed it wise to postpone the election of officers. It is popularly supposed that they are seeking men who own motors, and who are not connected with the trade. At any rate, they merely chose nine directors who, it is said, wil hold office until the first annual meeting, which will occur next month. By that time, it is hoped that men whose interest extends to the purchase and use of motors will be found to grace the executive offices. Meanwhile, it is announced that "a vigorous campaign for members is to be made."

Although he forms one of the directors, it is not known whether the "campaign" includes an arrangement with the ex-professional bicyclist such as he, like a truly patriotic member, effected with the American Motor League, or its president, I. Potter, who is also a "democratic" director—that is, a "rake off" for every member he was able to obtain.

ORMOND EVENTS OPEN

Axe-Grinding Attempt to Restrict Entries is Defeated—President Burgoyne Speaks.

C. G. Burgoyne, president of the Florida East Coast Automobile Association, saw a great white light late last week. As a result the Ormond carnival will be open to the whole wide world.

It proved a rude shock to the former professional participant in six days' bicycle "grinds" who manages the carnival. He had been given absolutely free hand in previous years, and had made the most of it in many ways. Because of differences—not all of them growing out of the Ormond function—he this year proposed to "fix" certain men. Even in his bicycle days he made history because of his aptitude in that line. But this time he proposed to "fix things" so that none with whom he was at odds could compete at all. Accordingly he announced that entry to the Ormond events would be by invitation only; and, of course, he would issue the invitations, or pass on them, at any rate. As it proved, he overstepped the bounds, and when President Burgoyne reached New York it did not take him long to discover that a mighty storm had brewed and was almost ready to break.

Mr. Burgoyne, a New York business man, whose health makes it necessary for him to live in Florida most of the year, came to New York recently for the purpose of securing members for the Florida East Coast Automobile Association. He had seen but very few of the men whose names he hoped to add to the list of members before he began to realize that a big mistake had been made in making the carnival an invitation affair, with the inviting power in the hands of the manager. The further he went, just so much more decided did his opinion become that the name and success of the carnival were in peril. He was not slow to act. Without waiting to consult the manager, he sent the following telegram to the association, which was in session at Daytona:

"Instead of restricting automobile races at Ormond-Daytona Beach, January 23 to 28, to invitation only, open them to the world at all standard distances from one mile to one hundred miles."

The answer came back at once, as follows:

"Have adopted your resolution verbatim. The races will be open."

What the manager said when he heard the news is not recorded, nor does it matter.

"My real business in New York was to promote the membership of the Florida East Coast Automobile Association, and I did not intend to bother with the races," said Mr. Burgoyne last Tuesday to a Motor World man. "I do not know much about racing, but so many men told me that a mistake had been made in not throwing the entry list open to the world that I was convinced that something had to be done. So I at once sent the telegram to the association, recommending that the events be thrown open, and received word at once that the invitation rule had been abolished. I do not know why the invitation rule was adopted. Some one made a motion to that effect at a meeting, and it was carried without discussion. I was surprised at the feeling the rule had caused.

"The Association now has a fine list of members. Some of the gentlemen who have joined since I came here are W. K. Vanderbilt, jr., Colonel John Jacob Astor, W. Gould Brokaw, S. B. Stevens, H. L. Bowden, E. R. Thomas, Colonel L. C. Weir, Florence O'Neil, of the Pittsburg Dispatch, and E. M. Steck, of Philadelphia. I sent in the applications of President Whipple of the American Automobile Association and F. A. La Roche a few days ago by wire, and have sent an invitation to B. M. Shanley, jr., of Newark, N. J., to become a member, but have not heard from him since. Henry M. Flagler joined our ranks about two months ago, and there are more prominent men coming in right along.

"Ormond Beach will be the future automobile playground of the world. Why, in July and August I can run my car as fast as it will go for an hour without even making the tires warm. I think there will be six thousand people down there next January to witness the races. The spectators can see most of the events without being in danger in case of accident. I live in Daytona, and in that city alone there are accommodations for two thousand more people than were there last year. Being the head of the association takes a lot of time, and I shall not be a candidate for re-election next year, but will go to Europe for a rest."

Sweden's Race Meet on Ice.

The Automobile Club of Sweden is making preparations for a race meeting on the ice of a fjord near Stockholm this winter, and has invited the owners of fast cars in other countries to enter the competition.

The Swedes have always been partial to winter sports on an extensive scale, and their plans for the automobile races include many different classes. It is proposed to hold the meeting in February, and the place that has received most favorable consideration is at Djursholm, an island in a fjord about eight miles north of Stockholm. An extensive course has been mapped out there, and already a cup valued at $275 has been offered. Events for racing and for touring cars are to be on the schedule, and to induce owners of cars to enter the club is trying to secure reduced rates on the railroads.

There are now very few high powered vehicles in Sweden, but it is hoped that cars will be entered which will reduce the record of 39 2-5 seconds for a mile, made by Henry Ford on Lake St. Clair in this country last winter.

MORRIS ELECTED PRESIDENT

Succeeds Scarritt as Head of A. C. A.—Latter Presents Interesting Data Concerning Speeds.

At the annual meeting of the Automobile Club of America, held in this city on Monday night, the full ticket prepared by the nominating committee was elected without opposition. It was made up as follows:

President, Dave Hennen Morris.

First vice-president, Colgate Hoyt.

Second vice-president, William K. Vanderbilt, jr.

Third vice-president, Clarence Gray Dinsmore.

Treasurer, Samuel H. Valentine.

Governors, to serve three years, James L. Breese, Melville D. Chapman and Harlan W. Whipple.

With the exception of Mr. Vanderbilt, who is advanced from the second to the third vice-presidency, the officers are all new. All except Mr. Valentine, however, have served the club as governors. Mr. Morris has been prominently identified with the management of the club, having served as a governor and as chairman of the racing committee for several years.

In his valedictory address retiring president Scarritt showed the club to be in a highly prosperous condition. Incidentally he brought out some interesting data regarding the strength of the club. Within the last year the roll has been increased by 165 new members, which had increased the revenue for the year by more than $20,000. The total membership is now 589, of whom 461 are active, 127 associate and one a life member.

In reviewing the services in the interests of automobiling accomplished by the club during the year, Mr. Scarritt gave interesting statistics concerning speed in Central Park and in other parts of the city. As a consequence of unjust discrimination in the arrest of automobilists in the park, he said, the club employed expert timers to ascertain the speeds of motor vehicles and horse drawn vehicles over surveyed courses in the park, in Riverside Drive and in Fifth avenue. The measured routes were each one-eighth of a mile in length, and the timers were employed for parts of fourteen days between 9 o'clock in the morning and 5:30 o'clock in the afternoon.

Of 437 horse drawn vehicles timed the highest rate of speed was 22.5 miles an hour, the lowest rate of speed 8.05 miles and the average rate 12.28 miles. Not a single arrest of a driver of a horse drawn vehicle was made for exceeding the speed limit of eight miles an hour.

Of 106 automobiles timed over the same courses the highest rate of speed was 21.42 miles an hour, the lowest 8.83 miles and the average 16.65 miles an hour. Arrests of automobilists for travelling at these rates were of daily occurrence, though Mr. Scarritt pointed out that an automobile going at six-

Digitized by Google

teen miles an hour is under much better control than a horse trotting at twelve miles an hour, and can be stopped within one-third the distance.

On Tuesday night Mr. Scarritt gave a dinner at the Waldorf-Astoria to President Morris, at which most of the retiring governors and their successors were present. A surprise for the host came near the close of the feast, when Mr. Morris exposed to view a magnificent $500 loving cup, and in a few well chosen words presented the cup to Mr. Scarritt as a mark of appreciation, on behalf of the governors, of the ex-president's valuable services during the past year. Mr. Scarritt, although taken entirely by surprise, responded in a most gracious manner in acknowledgment of the gift.

Colonel John Jacob Astor, Peter Cooper Hewitt, Harlan W. Whipple, president of the American Automobile Association; Albert R. Shattuck, the predecessor of Mr. Scarritt as president of the Automobile Club of America, and George F. Chamberlin were among the guests. A number of speeches were made, but they were informal in character.

It is expected that Mr. Scarritt will be reelected to the vacancy in the board of governors caused by the elevation of Mr. Morris to the presidency.

The annual banquet of the club will be held at the Waldorf-Astoria on January 21, the closing night of the show at Madison Square Garden.

Arent Ready for Business.

After a long and at times uncertain appearing struggle with the Grim Reaper, Geo. Arents, Jr., one of the victims of the only serious accident in the Vanderbilt Cup race, is well along on the road to recovery. It is expected that he will be able to resume the management of his business affairs next week. He is still at the Garden City Hotel, where he was removed from the Nassau County Hospital, but will be able to leave there in a few days.

Beyond the fact that his mind is a total blank on the subject of the accident and the killing of his mechanician, Carl Mensel, Arents's recovery is complete. His memory is, with the exception noted, perfect and his physical condition leaves nothing to be desired.

Odell's Joke on Hill.

A letter from Elmira, N. Y., tells a story concerning David B. Hill and his opinion of automobiles:

Not long ago Mr. Hill was dining with ex-Governor Odell at a club in Albany (socially they are very good friends). The Governor had just purchased a new automobile, and he said to Hill:

"Why don't you buy a machine?"

"I would not rent one and I do not care to own a machine I could not manage," was Hill's answer.

Odell looked at him reproachfully and asked: "Has not that always been your trouble, Hill?"

NEW HAVEN MOTORISTS' MECCA

Big Football Game the Magnet that Attracted Them—Speed Laws Variously Interpreted.

One of the greatest gatherings of automobiles that ever took place in this country was seen at New Haven last Saturday, when the Yale-Harvard football game took place. They came from places as far away as Boston on the north and Philadelphia on the south, and the checkerboard bit of turf on which the doughty warriors were to do battle for their alma maters was the Mecca of all.

Few of the cars arrived at New Haven the night before the game. It is well known that the town is always full to overflowing on Friday night, and that accommodations are not to be had unless they have been engaged long beforehand. On this account a number of the cars—and especially those coming from a distance—were driven to nearby towns, such as Hartford, Springfield, Bridgeport, etc., and then driven to the college town on Saturday morning in ample time for the game. In other cases early morning starts were made from New York, and even Boston, and the intervening miles traversed at a rapid gait.

The day of the annual football game is the one day of the year when Connecticut's draconian speed laws are relaxed and the exultant motorists permitted to open up and cut loose without further interference than a warning finger or an expostulatory utterance from the watching constables. Saturday was no exception to the rule. Big touring cars were the popular types, and the roads for miles on each side of New Haven were alive with them. Loaded to their full capacities with happy, laughing parties of pleasure seekers, a large proportion of whom were of the fair sex, and making a brave show of crimson or blue, they tore along, devouring hills as if they did not exist and rushing along the levels at railroad speed. Some remarkable performances were made. One of the best runs of the day was made by George Sykes, of Rockville, Conn., who made the fifty-seven miles from that city to New Haven in 1 hour, 35 minutes. Senator Maxwell's car, driven by Chauffeur Roberts, is said to have gone from Hartford to New-Haven, forty-two miles, in 1:10. James Joyce in a Columbia car, with a party of five friends, went to the green in New Haven in 1:14, while M. J. Budlong's car, driven by Bert Holcomb, made the distance in the same time with a well loaded car, with top and glass wind shield in front.

But if the Nutmeg State officials were leniently disposed, it was not so with their fellows over the New York border. At Rye, for example, preparations were made to celebrate the day by "laying for" speeding motorists, and a big haul was made. The twenty constables sworn in by the village officials continued until after midnight Saturday to arrest automobile parties going and returning to New York from the game at New Haven. The record for the day was twenty-two arrests, which yielded a revenue of $315 to the village treasury in fines.

Eleven of the car owners were held up while on their way to the game, and eleven were stopped returning at night. Judge Wilcox sat up nearly all night holding court in a small house near the roadside.

Woodbury on Street Cleaning.

How asphalt pavements should be cleaned is explained by Commissioner Woodbury, of this city, in a letter sent in reply to one from Chairman John C. Eames of the Merchants' Association Committee on City Conditions.

"There is but one way to sanitarily cleanse asphalt pavement, and that is by thoroughly washing the surface with water," he says. "I mean by washing the surface applying the water to the asphalt with a sufficient degree of force to thoroughly scour all the loosened gum which so tightly clings to the asphalt in every month of the year in dry conditions. This can be done every day in the year when the atmospheric temperature is above 45 degrees Fahrenheit, and should be done at night or at such times as there is little or no traffic upon the streets.

"If water is delivered upon the asphalt at an angle of 45 degrees, with a muzzle velocity of forty pounds of pressure to the square inch, it is found that all of the gum, which is due to the compression by wheels of heavy or rapidly moving traffic of materials dropped upon the surface, is thoroughly washed away and a clean asphalt surface exposed, which is not slippery and which permits a good footing for the horse or traction for motor vehicles."

Placques for Bennett Cup Winner.

Past, present and future holders of the Bennett Cup will hereafter have in their possession something of an enduring character. The donor of the cup, James Gordon Bennett, has offered to give all winners handsome silver plaques. These plaques will bear a silver reproduction of the cup, with a suitable inscription, and are to be given to the winning clubs as a permanent reward. Each club can obtain only one of these trophies, hence only three have been ordered, which will be handed to the French, English and German Automobile clubs, respectively.

Ford to Build Big Racer.

Henry Ford is building an eight cylinder racing car of 80 horsepower that will weigh only 1,300 pounds, according to a report from Detroit. The new car and the little machine with which Kulick scored so heavily at the Empire City track on Election Day are both to be sent to Florida for the Ormond races. Ford thinks the small machine capable of a mile on a circular track in 51 seconds. The big car is said to be nearly completed, and is expected to be ready for its trial spins the first week of December.

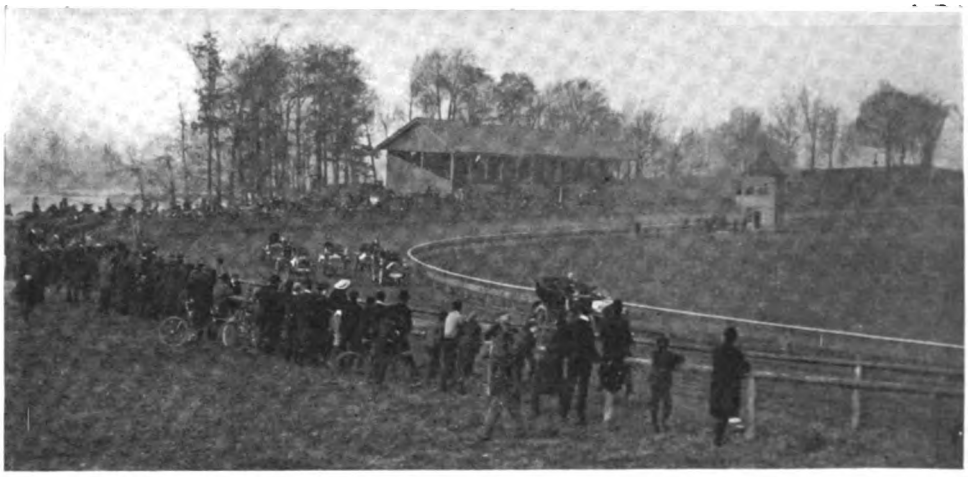
NEWARK'S MATINEE MEET

"Free Show" That Interested Six Thousand and Was Held Safe by Providence.

Some unusually close contests were witnessed at the first annual race meet of the New Jersey Automobile and Motor Club, held last Saturday on the old fair grounds track at Waverley, N. J. Several times was the spectacle of two cars going the entire distance of a race, at no time more than a length separating them. Though the track is a half mile one and not very wide, five cars were started in one event and six in another without the slightest accident. It seemed as if Providence had that particular part of the country and its temporary inhabitants under its special care, for few things were omitted in the way of running needless risks. While races were being decided, contestants in later events were permitted to go out on the track and "warm up" their cars, there being at one time three practising cars out, while one of the races was on. The fence on the outside of the track was lined with spectators almost for its entire distance.

ONE OF THE MATINEE EVENTS.



Bernard M. Shanley, jr., a former president of the organization and the present owner of the 90 horsepower Mercedes with which W. K. Vanderbilt, jr., established the mile straightaway record of 39 seconds, had been one of the prime movers in the promotion of the meet. It was no small task the club undertook, as the track is in a public park, and no admission could be charged. Not only were seats in the grandstand free, but well printed programmes were distributed without charge. The club also provided a good band of music. The track is in a little valley, and the surrounding low hills served as a point of vantage for many of the six thousand spectators who witnessed the contests. Mr. Shanley acted as starter, and the murderous appearing "young cannon" he used was a source of mingled delight and dread to the small boys who were crowded on the fence behind him.

Just before the last races of the day, Mr. Shanley gave an exhibition with his big Mercedes. A new body, built very low and with but two racing seats, has been put on the chassis. The whole affair—bonnet, wheels and all—has been painted a bright green, and when it drew up in front of the stand before the exhibition, the band struck up "The Wearing of the Green." Mr. Shanley has not adopted the crouching position assumed by Oldfield and others when driving his car at speed, but leans back in his seat as did Fournier when he made his mile straightaway record on the Coney Island Boulevard in 1901. Though he had tried his car but once on the Empire City track and once the day before at Waverley, he made very good time for the half mile course. He took the short turns without skidding and seemed to enjoy his work. He had intended to go five miles, but a gasket blew out at four and one-half miles.

STARTER SHANLEY AND HIS GUN.

The ten-mile race for the cup donated by Mr. Shanley was free to all cars costing not more than $6,500. It had six starters, all in one heat. These cars were the new Speedway of J. H. Amory, with a 24 horsepower Seabury engine; a 40 horsepower Thomas Flier which had M. Roberts as its driver and Fred J. Titus as a passenger; the New York-Chicago record holding Columbia, a 12 horsepower Autocar, a 16 horsepower Locomobile and a Decauville of the same power. The Thomas, which had its muffler connected, gained from the very start, and won by almost three-quarters of a mile. The Speedway and the Locomobile had a great brush, the former taking second place by a length.

THE THOMAS CAR LEAVING THE BUNCH.

The new Thomas, which was entered by H. S. Haupt, the New York agent, ran beautifully for the entire ten miles. It was so silent that it could hardly be heard from the grandstand when it rushed through the home-stretch. Roberts did not attempt any fancy driving, but kept near the outside fence most of the time, so he could get around the turns easier. When Roberts gained his lap on the Speedway and the Locomobile he passed them in front of the grandstand, while the spectators yelled their delight. The new Speedway had but one wide seat on it, and the seat and bonnet both had a decidedly "home made" appearance. The Columbia "Betsy II," which is being used by a Dunlop tire demonstrating crew through New Jersey, was not

Digitized by Google

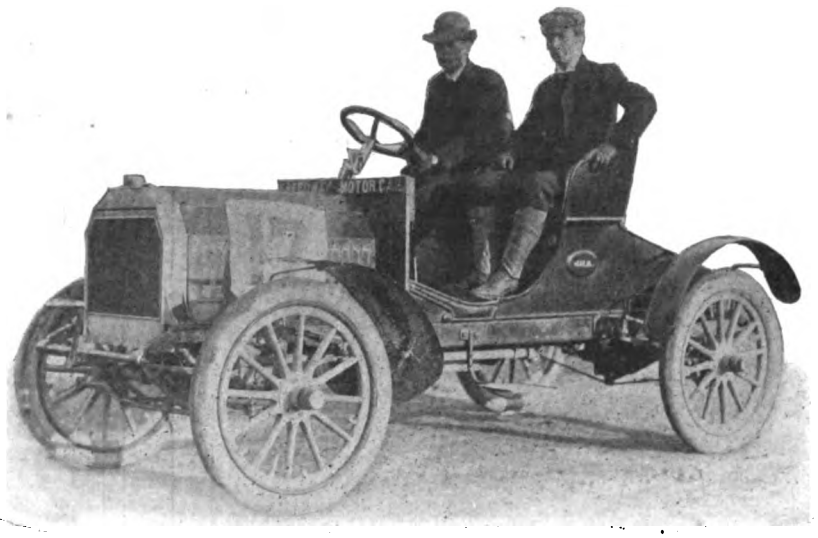
in the best of racing condition, and did not finish the ten miles.

Summaries:

Three miles, stock cars costing from $500 to $750; regular equipment—Won by I. M. Upperen (8¼ horsepower Cadillac); F. Evenden (4 horsepower Oldsmobile), second. Time, 6:48½.

Three miles, single cylinder motor bicycles, stock machines—Won by W. H. Cornwell (Indian); Joseph J. Boland (Special), second. Time, 5:03 1-5.

Five miles (trial heats at three miles); stock cars costing from $750 to $900; regular equipment: First heat—Won by A. W. Stockbridge (12 horsepower Michigan); I. M. Upperen (8¼ horsepower Cadillac), second; Clarence Fisher (10 horsepower Autocar), third. Time, 5:36 2-5. Second heat—Won by R. T. Newton (10 horsepower Autocar); C. H. Gillette (10 horsepower Pope-Hartford), second. Time, 6:03 1-5. Final heat—Won by Newton; Stockbridge, second. Time, 8:54 4-5.



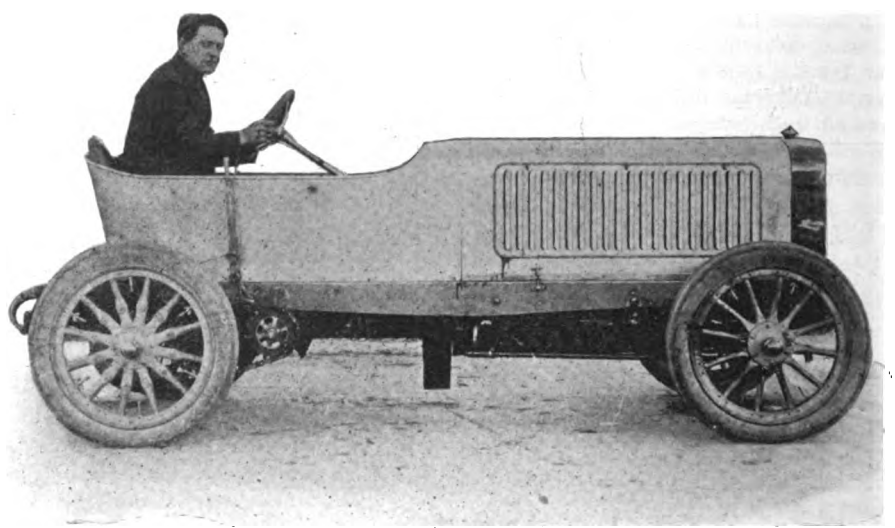
Three miles; stock cars costing from $950 to $2,000; regular equipment—Won by A. W. Stockbridge (12 horsepower Michigan); W. I. Fisk (9 horsepower Locomobile), second. Time, 5:51.

Five miles; light touring cars costing from $750 to $1,700, each to carry four passengers of 125 pounds average weight—Won by A. W. Stockbridge (12 horsepower Michigan); L. J. Wyckoff (10 horsepower Franklin), second; I. M. Upperen (8¼ horsepower Cadillac), third. Time, 9:25.

B. M. Shanley, jr., Cup; ten miles; stock cars costing less than $6,500; regular equipment—Won by M. Roberts (40 horsepower Thomas); J. H. Amory (24 horsepower Speedway), second; Edward Strasser (16 horsepower Locomobile), third. Time, 15:55.

Frederick R. Pratt Cup; five-mile handicap; stock cars costing less than $6,500—Won by J. H. Amory (24 horsepower Speedway; scratch); Edward Strasser (16 horsepower Locomobile; scratch), second; A. W. Stockbridge (12 horsepower Michigan; 6 seconds), third. Time, 9:10.

Exhibition by B. M. Shanley, jr. (90 horsepower Mercedes car, holding world's one-mile record of 39 seconds)—Time by miles, 1:17 4-5, 2:37, 3:57 1-5, 5:17 1-5; four and one-half miles, 5:56 1-5.



THE NEW SEABURY SPEEDWAY CAR.

Pope's New Racer Ready.

As an earnest of its announced intention to better the present world's straightaway mile recorf of 39 seconds, the Pope Motor Car Co. has completed what it claims to be the highest powered racing car ever built in this country. As can be seen from the accompanying illustration, the new six cylinder Pope-Toledo is well adapted for racing. Its makers hope that it will perform proportionately better than the 24 horsepower touring car which was in third place when the Vanderbilt Cup race was stopped.

The six cylinder engine develops something more than 90 horsepower. The cylinder dimensions are 6x6 inches. There is a direct drive and no transmission gear. The engine shaft is connected to the counter shaft by a bevel gear, and the rear wheels are driven by chains from the counter shaft. As geared at present, every time the engine completes a full revolution the driving wheels do likewise. The axles and steering knuckles are made of nickel steel. The radiator and bonnet are of the regular Pope-Toledo type. The car weighs less than 2,204 pounds, the limit for heavy racing machines.

The new racing machine will have its first public trial at the Ormond-Daytona Beach races in Florida next January. A. C. Webb, who drove the 60 horsepower Pope-Toledo racer in the Vanderbilt Cup race, will be the pilot of the new car.

A. C. WEBB IN THE NEW POPE-TOLEDO RACER.

Dead Heat Creates an Issue.

It will be recalled that in the Gaillon hill climbing contest for heavy cars Rigolly and Baras made a dead heat, each mounting the hill in 29 seconds, equal to seventy-seven miles an hour. Owing to this it was difficult to award the cup offered by the Figaro to the winner in the heavy car class, as Rigolly is the present holder. The question arose: Should he be left the possessor of it, or should the race be recontested?

The two contestants have both been interviewed on the subject. Baras says it is his opinion that he and Rigolly ought to start again, and that the present result cannot be allowed to stand. He is ready to run again if Rigolly will consent. Rigolly thinks he should remain in possession of the cup, since Baras has not in any way surpassed him. But if it is thought desirable, he is willing to renew the contest. What Rigolly proposes is that each competitor shall run again, making two trips over the course, and the best time of these two trips is alone to be counted. Baras has accepted these conditions, and the race will therefore take place again between the two competitors. The time will be taken by a timekeeper of the A. C. F. The date is not yet fixed.

Racing Man in New Role.

Fred J. Titus, once famous as a bicycle racing man, and who "trained" for the automobile trade at the Pope-Toledo factory, has engaged with H. S. Haupt, the Thomas agent in New York.

SWITZERLAND'S WARM WELCOME

How the Touring Motorist's Life is Made Miserable by Petty Persecution.

In Switzerland the motorist's lot is not a happy one. He is badgered and bullied from the time he enters that land of liberty until he bids it an exultant farewell. An American, Dr. Wood McMurthy, has this to say of his experiences there:

"The only country I regret visiting with my automobile is Switzerland. I advise all automobilists to forego visiting that country until its authorities, and a certain part of its inhabitants learn at least a few of the rules of civilized communities. As matters stood when I visited Switzerland, an automobilist was regarded simply and solely as a felon and a legitimate subject from which to extort an arbitrary revenue. In some of the smaller villages the exchequer is filled by the monstrously unjust fines inflicted upon practically all automobilists passing through.

"Take my own case. As I entered the village of Horw I saw at the far end of a long street a gendarme surrounded by a number of villagers. Knowing the methods of the Swiss police, I slowed down to five or six kilometres an hour; but the fact that I was going slowly did not save me. I was called upon to halt, and informed that I was travelling at thirty-nine kilometres an hour, and that I must appear at the court, to be held several days later. While we were standing in the middle of the street two more machines came up, and, despite the fact that the guardian of the peace had not witnessed their arrival, he immediately went up to them and charged their owners with travelling at excessive speeds.

"We protested, but uselessly, and found it necessary to deposit 30 francs each with the Mayor before we were at liberty to proceed. We decided to await the trial, at great inconvenience to ourselves, and passed three disagreeable days in the village. The case was so glaringly in favor of all three of us that the 'juge' acquitted us, a result made known to me some weeks later. Our deposits were kept, however, and though I have written several times I can obtain no answer with respect to mine. Our arrest was only an incident in a huge, organized system of legalized highway robbery. At all the hotels I met automobilists with the same tale."

Saved from a Shock.

Automobiles have been put to many uses, but it remained for a clever Germantown electrician to put a machine to a use as novel as it was ingenious, though simple at that. The arc light at the northwest corner of Germantown and Chelten avenues suddenly went out Thursday night. Kicking the pole and a dozen other familiar methods failed to jar the carbons into proper position. Then the lamp was lowered, but all were afraid to touch it, as no one had rubber gloves or other means of insulation.

The chances of shock were increased by the wet pavement, and dripping lamp. Just then, as the darkness and delay became most vexatious at that much frequented corner, an automobile drove up and its owner got out and went into the postoffice. A happy thought struck the electrician, and he had a minute's hurried conversation with the owner. The electrician raised the lamp, while the automobilist drove the machine under it. Then the electrician stood on the automobile, safe with the protection of the insulation of the four rubber tires, and easily adjusted the carbons, and there was light again.

To Tinker New Jersey's Law.

Assemblyman Henry C. Scoville, of Camden, N. J., is already preparing to introduce amendments to the New Jersey automobile law, with the idea of making it still more stringent than it now is. He outlined the new features last week at the annual meeting of the Camden County Board of Agriculture, when he said:

"The roads in the country were primarily meant for the driver and people who used vehicles that were not dangerous. Automobiles have come to stay, but those who use them must be governed by some set of laws that will not make them a nuisance to the public. At the meeting of the next legislature I propose to introduce a few amendments which I think will be for the good of all concerned. First, for every violation of the automobile act, arrest without a warrant. Second, reduce the speed limit to whatever may be deemed proper. The speed limit of twenty miles an hour that is in force now is excessive. Third, that automobiles while in this State shall display only one number, the number of the State, on the back. Many of them have three or more numbers, and in the cloud of dust that is raised when they pass none of them can be easily distinguished."

Conflicts with State Law.

A speed limit of eight miles an hour is proposed for automobiles in Taunton, Mass., by the council committee on streets and bridges of that city. The ordinance provides that no self-propelled vehicle shall be allowed to go at a greater rate of speed than eight miles an hour within one and one-half miles of the City Hall. Local motorists are trying to have the rule changed to conform with the State law, which provides for ten miles an hour in cities and fifteen miles an hour in the country.

How Italy Regulates Speed.

The Italian commission charged with the drawing up of rules regarding automobile traffic in Italy has decreed that all automobiles must keep to the right, that a speed of nine miles an hour must not be exceeded in the cities, but that any speed may be attained in the country.

HACK DRIVERS RAISE ISSUE

Institute Action to Discover Whether Sightseeing Automobiles are Stages.

The question whether sightseeing automobiles are stages and so subject to the existing laws regarding such vehicles is now in a fair way to be settled by the courts.

It came up for argument on Monday before Justice Amend in the New York Supreme Court. The case was brought into the courts by the Hack Drivers' Union. One of the members of the union causing the arrest of James Tallon, an automobile operator, on September 9, and, to test the matter, Magistrate Moss held Tallon for trial in the Court of Special Sessions. Then Tallon's counsel, J. A. Hodge, got a writ of habeas corpus. The writ was made returnable on Monday before Justice Amend.

Counsel for the company owning the sightseeing automobile contended that there was no evidence that Tallon had violated any law, and that the sightseeing coach did not come within the law regulating the operation of stages carrying passengers, because it had no fixed route and did not take on and let off passengers en route. Charles Knox and J. T. Dooling, counsel for the Hack Drivers' Union, argued that the company ought to have obtained a franchise from the Mayor and Board of Aldermen. To get such a franchise, counsel said, the company must have obtained first the consent of the majority of the property owners along the line of streets used, and that of any railroad company occupying a street where the automobile coaches were operated for more than a thousand feet.

Assistant District Attorney Johnstone appeared for The People, supporting the charge against Tallon. Justice Amend reserved decision. The case will be carried to the higher courts.

It may have no connection with the matter, but it is interesting to note that the name of "Florrie" Sullivan, who is popularly credited with having a controlling influence with the Board of Aldermen, appears among the incorporators of a sightseeing company this week.

Indignant Jerseymen Start Stage Line.

An automobile stage line is to be established between Trenton, N. J., and Yardville, a nearby town, by indignant residents of the latter place. Up to recently the Trenton Street Railway Co. ran cars to Yardville every half hour, but are now running them an hour apart. The firm to operate the line will be known as the Automobile Transportation Co. The machines will run every half hour, and the fare will be 10 cents, the same as is charged by the railway company. The machines will be inclosed, and will carry thirty passengers.

SPARKING PLUG ATTRIBUTES

Insulation and Durability are Opposing Qualities —Choice of Materials Not Easy.

Sparking plug construction and design necessarily embody a compromise. The most important attribute of a plug is insulation. Yet if it were possible to consider insulation alone sparking plug manufacture would be revolutionized in a day. As concessions have to be made to durability, however, such materials as porcelain and mica are made use of.

"Theoretically the ideal material is glass. It possesses almost perfect insulating properties, and to them it owes its popularity with the telegraph companies, who use glass insulators for nearly all outside work. But glass is of such a perishable nature that it is utterly unsuited for sparking plugs. Not only would it break if struck by any hard substance, but a drop of hot water or other liquid falling on it would crack it quicker than you could say 'Jack Robinson.' It is even probable that jarring over rough roads would shatter it," said a New York tradesman in the course of a conversation with a Motor World man.

"Now, porcelain comes next to glass in the matter of insulating properties, and it possesses the advantage of being somewhat tougher. To these facts it owes its popularity as a material for sparking plugs. There is porcelain and porcelain, and the best of it is none too good, while the worst of it is mighty poor stuff. Imported porcelain is principally used, for the reason that it is better. I suppose this is due to the fact that the ceramic art is so much older over there, being a growth of centuries, while here it has flourished only a few years.

"Porcelain is a good insulator, but it will crack and break on the slightest provocation—and sometimes without any. That is where mica gets its chance. It is inferior as an insulating material to porcelain, but it is much more durable. A mica plug is made up of hundreds of little pieces of mica, which are put in a hydraulic press and forced into such intimate relation that they become like a solid piece. They can't break. The only danger to be apprehended is that a separation of the layers will take place—a separation not detectable by the eye, even through a powerful glass—and thus permit the electricity to leak. The same thing happens if a porcelain plug becomes porous, either in large or small degree. The leakage thus set up may be small, but it decreases the 'fatness' of the spark and results in a slowly or imperfectly ignited charge, with a consequent reduction in the force of the explosion.

"When this occurs you wonder what is wrong. There is a loss of power somewhere, but you may search a long time before tracing it to the sparking plug."

Odd Outcome of Dealer's Suit.

A peculiar predicament is that confronting Colonel John M. Foster, of this city, as a result of a court order issued last week. He is required to return an automobile that is no longer in his possession, having been sold by him some time ago.

It appears that a jury in the Circuit Court, Newark, N. J., before Judge Adams, rendered a verdict directing Colonel Foster to return to George M. Condon, of No. 283 Halsey street, an automobile, which the former secured through replevin proceedings from Condon, and against which Condon had a bill for repairs amounting to $359.

Condon sold the car in question some time ago to Colonel Foster, and it is alleged that the latter's son, Howard C., met with several accidents while operating it which necessitated its being returned to Condon for repairs. When the bill for the work was presented to Howard Foster it is claimed that he asked Condon to split it into small instalments. Condon, however, refused, as the work had been done. The elder Foster, it is said, disputed the bill for repairs, and when Condon would not surrender the machine without his money, he replevined it.

De Dion at Last Comes Over.

De Dion-Bouton, Ltd., have at last come 'round to the sliding gear type of transmission. The time honored gear box with the famous expanding clutches will in future only be fitted to the 6 horsepower cars, these cars having a gear clutch box similar to that hitherto built into the 8 horsepower car, with three speeds forward and a reverse. The 8 horsepower, like the higher powered cars, will be fitted with change speed gear of the "baladeur," or modified Panhard, type, and a novel clutch system, consisting of metal-to-metal disks held in driving contact by spiral springs. The 1905 line will comprise the 8 horsepower single cylinder car, the 10 horsepower and 12 horsepower two cylinder cars, and the 15 horsepower four cylinder car.

Serpollet's New Steamer.

It is reported that the Gardner-Serpollet Company are bringing out for the 1905 season a new type of light steam car, in which the engine will be located under the bonnet in the front of the frame, and in which, in place of a condenser, a radiator with fan will be employed. Improvements have also been effected in the burner by which the consumption of gasolene will be greatly reduced.

Wagon Works "Trying Out" Automobiles.

The Harrison Wagon Works, a large Grand Rapids, Mich., concern, is at work on two experimental automobiles. Should these prove successful, the concern will begin the manufacture of cars on an extensive scale.

The Michigan Motor & Mfg. Co., of Detroit, Mich., has purchased the plant of the Rough Wagon Co., at Buchanan, Mich., and will remove there at once.

PREMIUM ON COMFORT

French Effort to Stimulate Body Design—Contest that is Being Arranged.

One factor in the success of the automobile —i, e., the design of the body—is becoming a recognized feature of the French exhibitions and competitions of the times. In the Paris Salon, the car which is considered to be the most comfortable wins a special prize, and this year a series of competitions is being organized especially for automobile bodies. Lately at Chateau-Thierry spectators looked on, not only at a race, but also at a rivalry of comfort and elegance in regard to the vehicles taking part. In January next there will be a competition for automobile carriage bodies, the rules for which are not yet fixed; but the vehicles are to be divided into classes according to their prices. These classes will be very similar to those of the tourist car competitions. This information is causing some excitement and stir among the body makers, more especially as report says that the jury is to be composed of specialists chosen not only for their knowledge of automobiles, but also for their well known good taste and judgment in matters of elegance.

The famous Vedrine, interviewed on this subject, says the idea is very interesting, and that he would certainly give the jury a chance of deciding on several automobile bodies of his manufacture. He thinks that automobile bodies have been too long neglected, especially considering that they are one of the most important parts of the car, and he is only surprised that similar competitions have not been held long ago. But better late than never, and it is to be hoped that the body makers will rise to the occasion. Messrs. Botiaux, Rothschild, etc., are equally enthusiastic, so there can be no doubt that the entries for this competition will be sufficiently numerous to encourage the organizers.

Substitute for a Shaft Pin.

A substitute for a split-pin may be improvised from an ordinary nail with a large head, one side of the latter being filed off if necessary to permit of the nail lodging close enough to the nut which it is intended to retain in position. The nail, when passed through the hole in the shaft, should be bent with a hammer so that it cannot slip out. A better split-pin may be made by means of a piece of iron wire, which should be bent round a nail by means of ordinary strong pliers until the part surrounding the nail forms as nearly a circle as is possible. The extended parts of the wire are then bent into the proper split-pin form by means of the pliers, but it is necessary to take care that the wire selected when doubled as a split-pin will fill comfortably the hole in the shaft into which it is to be placed.

BENNETT CUP CONDITIONS

Limit for Entries is Extended, but Safeguards are Thrown Around It.

Two changes have been made by the racing committee of the Automobile Club of America in the conditions governing the receipt of entries for the Bennett Cup race. They are as follows:

Extending the date at which entrants' cars must be placed at the disposal of the committee (which was previously fixed for April 15) to May 1, 1905.

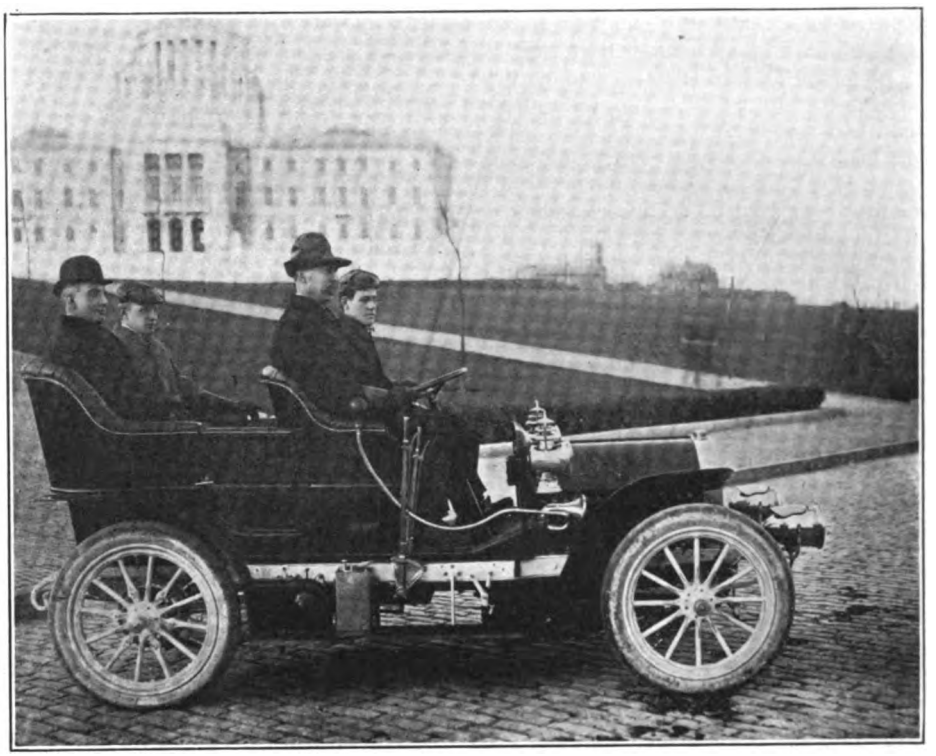
That each entrant must file with the club secretary on or before May 1, 1905, an affidavit that his car has been entirely completed for a period of over two weeks.

The date of closing of entries in the United States remains the same, viz., December 15, 1904.

The foregoing changes do not otherwise affect the conditions laid down last August by the Automobile Club of America for the conduct of the cup race trials. They were formulated after the farcical trials of last spring, with the special purpose of preventing a repetition of such a fiasco.

These conditions require that each car presented for competition shall have been completed for a period of over four weeks; that it has been run at least 1,000 miles on the road, at least 250 miles without stopping engine, and at least forty miles within the hour on road or track.

An entrance fee of $600 is required, which is to be refunded to any entrant complying with the club's rules who is not nominated as a member of the team. A nominated entrant who does not start in the race forfeits the entrance fee, and entrants who do start are to be remitted a portion of the fee after the expenses incurred in holding the race are paid. It is also provided that any entrant who does not present his car for the trials, or who refuses to undergo the tests or abide by the rules, shall be ineligible to enter the race for that year, and may forfeit his entrance fee.



Shot Cattle to Save Life.

Meeting a herd of eight hundred cattle in a narrow pass road near Gaviota, Cal., Gilbert E. Bailey and his wife, of San Francisco, had a narrow escape from death. The automobile was at one of the narrowest parts of the road when the cattle were encountered, and the first part of the herd passed the machine in safety. The main body of the herd became frightened and tried to pass too quickly, and the machine was in great danger of being pushed over the edge of the road. Bailey shot some of the cattle with a heavy revolver, and in that manner saved his own life and that of his wife. The machine was badly wrecked.

How Davis Climbed the Hill.

When Colonel Nelson S. Davis, the Locomobile agent in Providence, R. I., received his first 1905-15-20 Locomobile, he promptly put it to that test which proves to Providence folk the "mettle" of each particular car—that is, he sent it up College Hill, that Rhode Island eminence which has brought either joy or sorrow to many an automobile owner.

The picture shows Mr. Davis in front of the Capitol at Providence after he had cantered up the steep grade on the high gear with the four passengers shown. Davis himself is at the wheel. Beside him is Murray Paige, of the Locomobile Co. Directly behind him is Fred Smith, a well known automobilist of Providence. M. V. Doud, of the Locomobile Co., was the other occupant of the tonneau.

DAVIS ON TOP OF COLLEGE HILL.

Chauffeurs Are Officially Teamsters.

It has been officially decided by the general officers of the International Brotherhood of Teamsters that an automobile driver is a teamster. The local organizers of the brotherhood had been considering the question of forming the automobile drivers into unions, but were in doubt whether an automobile driver could be classed as a teamster. The case was referred to the general officers, who directed the New York men to organize the automobile drivers. The automobile drivers are still to be heard from.

Held the Lucky Number.

It was a fortunate investment for Mrs. Mamie E. Mealie, of No. 223 West Thirteenth street, New York, when she paid $1 for ticket No. 816 at the Harvest Festival, in aid of the Free Industrial School for Crippled Children, at the Waldorf-Astoria, this city, last week. That number won the electric automobile that was offered as a prize.

WON'T IMPOSE PENALTY

Tourist Who got into Trouble with Customs Officials Finds Relief.

The law governing the importation of automobiles in bond for touring purposes was defined on Monday in a letter from Assistant Secretary of the Treasury Robert B. Armstrong to Collector Stranahan of the Port of New York.

The letter was called for by a complaint from Col. J. B. Wilkinson, jr., counsel for H. T. Kearney, a Californian, resident abroad, against the assessment of a penalty for alleged undervaluation of a Mercedes car he imported on November 10 for a tour of this country. Kearney entered the car at $7,000, and gave a bond of $10,000 to guarantee its exportation within three months. The appraiser, however, put the value at $8,425, and held the car for the collection of a penalty of $2,000 for the alleged undervaluation. This advance in value was sustained by General Appraiser Fischer. Then Colonel Wilkinson explained to the department that Kearney had entered the car at the price he paid for it, thinking that this was the correct proceeding.

Assistant Secretary Armstrong now orders Collector Stranahan to release the machine, explaining that it was not the intention of the department to assess penalties on automobiles imported in good faith for touring purposes.

Champaign, Ill., has hopes of shortly having an automobile factory "in its midst." No names are given in connection with the project, however.

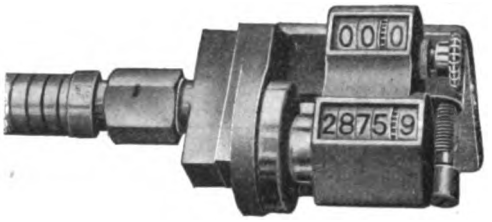
"Racing" and Clutching Abuses.

A particularly aggravating form of abuse of a car is the needless "racing" of the motor. The experienced driver does not, as a rule, throw the throttle wide open and let the motor try to fly out of the car while he puts on his gloves or attends to some other little errand before starting. On the contrary, he takes a pride in making each turn of the motor carry him as far as possible, to the saving of fuel, noise, vibration and odor, and at all times aims to keep the motor running at the lowest practical rate of speed.

Coupled with the racing motor is the sudden clutching abuse practised by the novice. With the motor running at high speed a sudden application of the clutch will cause the vehicle to jump forward or backward, as the case may be, straining all parts of the driving gear, and moving the car so quickly that persons to the front or rear are more or less in danger. Possibly such abuse is frequently due to the inexperience or ignorance of the proper way, and it seems more charitable to assume this. The experienced driver takes a pride in moving away without a jar or jerk, and this is as true in driving a motor car as in handling a locomotive.

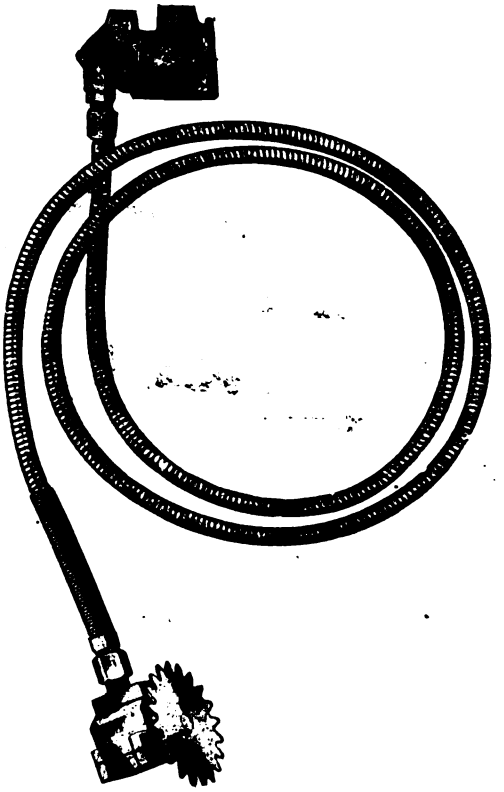
Winter Care of Tires.



As a rule, toward the end of the season motorists are less particular about the condition of the tires on their cars and less anxious as to sending them to be repaired directly they show any signs of wear. In fact, many delay sending them to the manufacturers until they cannot run any longer. Others take off the tires, wrap them up carefully and put them away according to all the rules for good preservation laid down by makers. And when the fine weather returns and they wish to "motor" again, they are surprised to find that the tires cannot be used until they have undergone some repairs; and consequently they have either to wait until these repairs are executed or buy new tires. It is much more simple, in order to prevent this contingency, to send all faulty tires to the repairers at once. The repairs will be done much quicker now than in the spring, when motor tire repairers will be overwhelmed with orders, and besides, the tires will be preserved just as well during the bad season after they have been repaired.

To Clean Plugs Without Removing Them.

With a multiple cylinder motor, it is easy to clear a sooty ignition plug without removing it from the cylinder, if the following plan is followed. Detach the high tension wire from the misbehaving plug, open the compression tap of its cylinder, and run the engine on the other cylinders. Then hold the terminal of the detached wire, being very careful not to touch the metal part with the fingers, a very short distance off the end of the plug, so that the spark jumps to the latter. At first the cylinder will be heard to be missing, but very quickly the reverse will be the case, and the dirty plug will be found to have cleared itself. Then switch off, shut your compression tap, attach your wire again, start up, and continue on your way rejoicing.



Veeder's Newest Odometer.

It was to have been expected that, the demand having arisen for a dashboard odometer, the Veeder Mfg. Co., Hartford, Conn., would be not only quick to meet it, but meet it with an article worthy of their reputation and experience as pioneers. This they have done, as the accompanying illustrations of the Veeder Form D, as the odometer is styled.

VEEDER D1 ODOMETER WITH STRAIGHT DRIVE.

shows. As is apparent, the odometer has two registers, the upper being a trip register, which may be set at zero at will, while the lower keeps a record of the total number of miles travelled.

VEEDER D2 ODOMETER WITH BEVEL DRIVE.

Both registers indicate in tenths, the right hand figure on each being in red. The figures themselves are of good readable size, and, instead of being distributed over a large area and widely separated, are compactly arranged, all the gearing of the odometer proper being contained inside the number rings themselves.

The instrument is operated by gears and flexible shaft, the latter being protected by a metallic, flexible sheathing. By using small drive gears and large pinions, a high speed of revolution for the flexible shaft is avoided.

Two styles of the Veeder Form D odometer are supplied—the straight drive and the bevel drive, which are known as the Form D1 and Form D2, respectively. In the first the flexible shaft is introduced horizontally directly into the side of the odometer; in the second the shaft may be brought up straight from the floor of the car or through the dash directly back of the instrument, bevel gears conveying the movement to the odometer.

All parts of the complete odometer are finished in polished nickel, unless otherwise specified, and though the Veeder people say they can supply the instruments finished in brass, they do so against their judgment, as the very best brass plating is apt to wear away in spots and will not stand the use of polishing preparations. Special attaching fixtures are provided for each of the standard makes of car. The price, complete with fixtures, is $25.

To Solder a Broken Tube.

To solder a broken tube or other break one must have a soldering lamp, or soldering iron, some chloride of zinc (which may be obtained by pouring some spirit of salts over zinc clippings), some tin solder, and a piece of sal ammoniac to clean the iron.

With these in hand proceed as follows: (1) Heat the iron, on a wood charcoal fire preferably; (2) scrape it while hot with an old file; (3) pass it on the sal ammoniac with a little solder (the point of the iron will be seen shining with the melted tin which remains adhering to it); (4) clean the surfaces to be soldered with the chloride of zinc, which may be done with a small brush or a piece of pointed wood; (5) spread some solder with the hot iron on the surfaces thus cleaned—they will be thus covered with tin, and one can easily make them adhere with the hot iron and a little solder melted by the hot iron on the parts to be joined. If chloride of zinc is not handy the cleaning may be done by a file or scraper, and a lamp or candle will serve to replace the cleaning of the chloride of zinc.

Soldering with a lamp is done with the same materials, but greater dexterity is necessary than is required by use of the iron. If you wish to repair with ease broken tube or leaking tank go spend an hour or two in the shop of a tinsmith, and with what is written above you will leave master of the soldering process.

When the Magneto Loses Power.

When the magneto ignition is failing in its magnetic powers it will be found that the engine loses power, as the ignition is not complete, as before. Consequently combustion is less rapid, and is followed by a loss of power. When this occurs it is only necessary to remove the horseshoe magnets from the machine, and to have them remagnetized by being placed against the fields of a dynamo which is working at its full power. By this the permanent magnets will be remagnetized, and the machine will then develop its full ignition power, and continue to work for a further lengthened period before further remagnitizing is required.

STARTING THE MOTOR

How to Avoid Broken Arms and Bruised Faces —Knack, Not Strength, Required.

Like everything else in the world, there is a right way and a wrong way to do even so simple a thing as to crank an automobile.

When everything is all right it does not matter how a car is cranked, but the best of operators at times will leave the spark advanced slightly, or it is possible in some cars that the mechanism may become uncoupled and advance it automatically, or that it may get out of adjustment and advance the spark without the operator noticing it.

With this in view, it is much better to form the habit of cranking a machine in such a way that injury is not possible, no matter if for any reason the spark is left advanced.

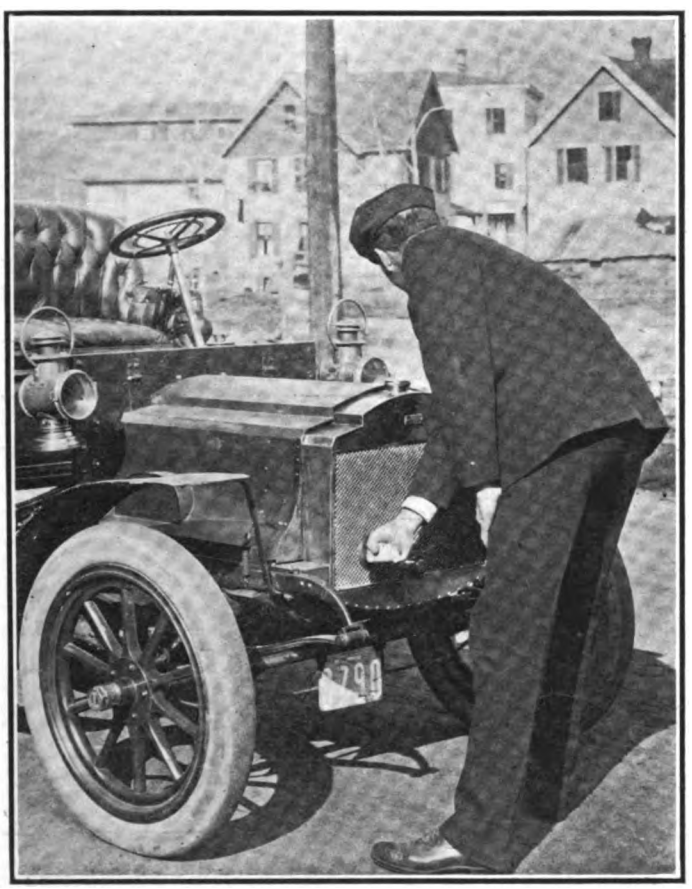
You may start the machine ninety-nine times out of a hundred with everything all right, and begin to think that nothing can happen, but the hundredth time a wrist is broken or a few front teeth are knocked out by coming in contact with the radiator on the front end of the hood of the machine. Once is enough, and it is much better to avoid even the once.

One of the accompanying photographs illustrates the right way, and the other one of the wrong ways—for there are several ways that are wrong.

Referring particularly to the position of the hand and the body as a whole: In the right way, with the machine cranking the way of the clock, it is easy to form the habit of grasping the crank with the left hand and taking hold mostly with the fingers, and not with the palm. As the compression begins to be felt on the upper quarter, the back should be straight and the arm straight, or nearly so, and the remainder of the compression overcome by a quick throw of the shoulder and the body, perhaps assisting a little bit with the arm.

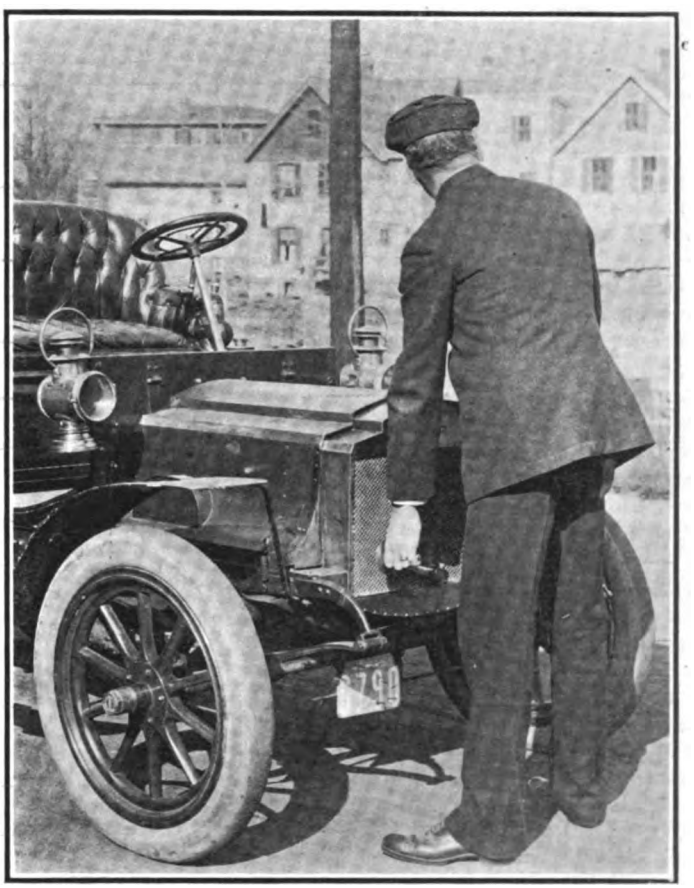
Should, for any reason, a premature explosion take place, the fingers will be whipped open, the crank fly around and find nothing to hit. The back being straight, there is no possibility that it will pull the body down and strike the head or face on the front end of the machine before the fingers will give. It has been tried many times with the spark advanced, and in every case the fingers open so easily and quickly that no harm has been done.

Referring to the other picture—the wrong way: Seizing the crank by the right hand, necessarily stooping over more or less in order to do it, and with the knuckles underneath the handle. The back is bent, the face is nearer the front end of the car, so that when the premature explosion comes, if it does come, the crank cannot open the fingers at all; certainly not quick enough to save the face from being bruised, or, if that escapes, from the crank coming around and hitting the arm, which is just in position to catch the return blow.



It may be, and quite likely is, awkward for a right handed man to do this the first time, but after once acquiring the habit (and it should be made a habit) few will depart from it again.

It is extremely easy to walk up to the machine, grasp the handle with the left hand, push the hub of the crank into connection with the shaft of the engine, simultaneously straighten the back, feel the first part of the compression, and then jerk the crank over the centre, giving the first explosion.



Inexperienced operators and ones not in touch with many others may think this taking unnecessary precautions; but it is a fact that not a few, but many, accidents have happened this last year by improper position while cranking automobiles. It is much better to learn by experience of others and take these seemingly unnecessary precautions than learn by sad personal experience.

Until machines are built to crank the opposite way of the clock it is difficult to see how the right hand can be used with perfect safety. As the photographs show, any one grasping the crank with the right hand and fingers under it, and even the palm under it, cannot get it out of the way of the rotating crank as quickly as in the other position shown. The crank exerts its force in a direction practically perpendicular to the bones of the hand, and it strikes so quickly that there is no possible chance of letting go before the harm is done.

On the other hand, with the knuckles and hand on the outside of the handle, when the

THE WRONG WAY.

THE RIGHT WAY.

Digitized by Google

crank strikes, the line of force is practically in a line with the bones of the hand and simply opens the fingers without doing anything else.

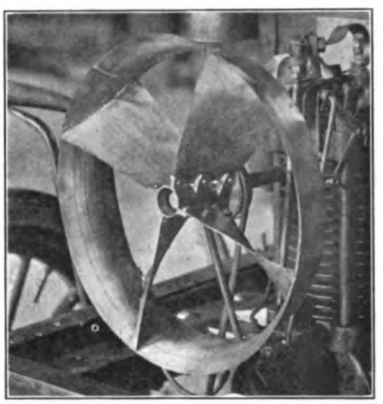
Some of the cars are very high in front, the top of the radiator, when grasping the crank with the right hand, being very near the face and head. It does not take much of a yank to bring the face violently in contact with the machine. There are not a few men who now possess "store teeth" as the result of just such accidents, while the number of arms that have been carried in splints or slings because of the "back kick" is far more numerous.

How to Start the Car.

There is a right as well as a wrong way of starting a gasolene car. Who has not watched or experienced the wrong way and wondered why a driver with any pretensions to skill should follow it? The engine is started and the occupants of the car brace themselves for the shock that they know is coming. The clutch is thrown in and the car plunges forward abruptly; it almost seems as if the sudden and tremendous application of power had lifted it off the ground. The passengers are forced back into their seats and then brought forward as the car picks up its speed. The process is a good imitation of that of a trolley car in a congested street when the motorman plays with the power, alternately applying and shutting it off, tilting the passengers back and forth as if they were manikins.

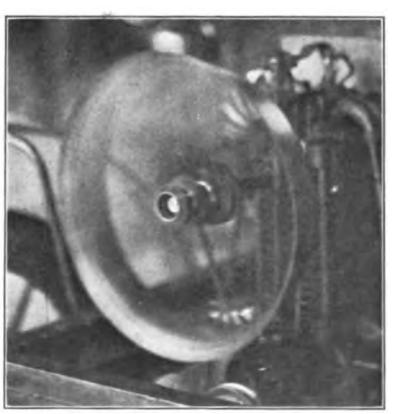
A driver who really knows his business never starts in this way, any more than does a locomotive engineer. He introduces his clutch gradually, permitting only part of the power to be transmitted at first, thus starting the car gradually and without the suspicion of a jerk. It gathers way, slowly at first, but before many yards have been traversed the clutch is forced home and the full power of the engine is being transmitted to the gearing.

The saving in wear and tear of engine, gears, frame, springs, wheels and tires by this method of starting is enormous.



Injected Water in His Tires.

It is often taken for granted that pneumatic tires are unsuitable for the roads of India and its climate alike. A motorist who has had much experience in that country combats this theory, however. He says that, as a matter of fact, there was no reason whatever why cars going to India should be specially fitted with solid tires. He himself, indeed, had never had a single puncture while driving in India.. So far as concerned heat, he found that this had no deleterious effect on tire covers, but for the better preservation of inner tubes he had discovered that a plan which answered admirably was to inject about a pint of water through the valve of each tire.. The expedient sounds novel, but, after all, "the proof of the pudding is in the eating."



TO SERVE TWO PURPOSES

Fan That Not Only Cools the Motor, but is Claimed to Quicken Speed.

Not alone as a cooling apparatus, but as an aid in propulsion is the aeropinion, made by the Aeropinion Concern, 1367 Broadway, Brooklyn, now put forth. The device as applied to a car, termed the Aerocar, and to a vehicle on runners for travelling on the ice, was described in the Motor World last winter, and its makers are now preparing to

push it in its new form as a cooling fan which can be applied to either air or water-cooled cars. So used, it is claimed to not only do the work of cooling much more effectually than any other type of fan, but as well to answer the purpose of an auxiliary in the work of propelling the car. Experiments conducted with the fan are said to have been of a highly satisfactory character.

At present the Aeropinion company is confining its efforts to pushing the sale of the fan as a cooling device. A practical illustration of its working is being given at the present time. A Cameron car has been fitted up with an aeropinion, the fan used to cool it having been removed to make room for the former. Experiments with the car standing still were made with first one fan and then the other. With the regular fan the engine cylinder became almost red hot, and it was impossible to bear the hand near it; but when the aeropinion was substituted an instantaneous improvement is claimed to have been made. No signs of excessive heating appeared, and the hand could be brought close enough to almost touch the engine. It is also claimed that a marked increase in speed and power was observable after the aeropinion had been fitted.

It is to the peculiar design of its blades and hub that the aeropinion owes its remarkable advantages. It affords the fullest and most positive resistance obtainable from the column of air with which, when in operation, it comes in contact, scrupulously delivering the full and unimpaired measure of power transmitted to it. When revolving at a working velocity it literally devours its passage through the air, the enlarged peak allowing a broad core of air to be continuously drawn in by the screw, rotary and forward movements, which is compressed through the waistband and forced against the points of greatest leverage on the blades. Exactly the same volume of air emerges from the rear that entered at the front. By varying the flare of the peak and the taper of the hub case, the discharge current may be concentrated to any compass or direction for such purposes as cooling motors. The manner of construction renders it practically indestructible by speeding. Every part is securely bound together at both hub and periphery, and all are protected by the bonnet.

Used as a fan, the aeropinion sweeps the heat from cylinder or radiator. It advances the vehicle while removing the heat, is stronger and will stand more r. p. m. and discharge more cubic feet of compressed air at each revolution, or, in any given time, than any other kind f detached fan.

The velocity of the blast when delivered upon the cylinder head is increased at the moment of escape by expansion and absorption of heat, greatly accelerating its force and cooling capacity.

Comparing this current with that of fans now in use, it is a cyclone to a strong wind. Applied to motors of competent radiating surface, with bonnets so constructed that free exit is provided for the heated air, its function is perfectly performed.

As stated, it is the intention of the concern at present to push the aeropinion as a cooling fan. With that object it seeks to interest makers of either air or water cooled cars, and stands ready to prove its contentions regarding the merits of the apparatus. A little later it will push the Aerocar, which is simply a car in which a much larger fan, power driven, is used to drive the vehicle, on land or ice, directly by the impact of the air from the fan.

Home-Made Fire Extinguisher.

On the theory that an ounce of prevention is worth a pound of cure, this tip is of some value:

It is a good idea to hang a bottle containing about a gallon of ammonia from the top of the tank or room containing the gasolene by a string or fusible link, so that if the gasolene takes fire the bottle will fall and be broken, releasing the ammonia and promptly putting out the burning gasolene.

Digitized by Google

EFFORTS TO DOWN THE DUST

Experiments to That End That Were Made and How they Panned Out.

One of the best features of the oil method of treating roads is the surprisingly enduring character of the work. No data is yet available shedding light on the exact length of time a covering of petroleum products will last, but experiments have gone sufficiently far to indicate that the term of usefulness will reach a year and perhaps longer. There is reason to believe, too, that the renewing process will be much easier and less costly than the initial application, although this, as well as the duration of the latter, is dependant to a considerable extent on the hardness of the road. One having a surface of stone will, of course, absorb less oil and retain it longer than one wholly or partly composed of loam or other natural soil. California oil treated roads are said to show splendid wearing qualities, while the Long Island sample, on the Vanderbilt cup course, is, to all appearances, in the same condition to-day as it was on the day of the race.

These conclusions are also borne out by experiments conducted on some roads in Scotland. Westrumite was made use of, half a ton being applied to a half-mile stretch on each road.

Previous to the first application the road was thoroughly cleaned and swept, and a 10 per cent solution applied by means of ordinary watering carts. Three days thereafter another 10 per cent solution was applied, but within a very few hours of this second application torrential rain fell over the district, which washed away a considerable portion of the mixture. Consequently, a third 10 per cent mixture was applied instead of, as was originally intended, two successive application of 5 per cent.

Crude oil was applied over a stretch of road comprising metalling at two stages of wear. In these cases the road surface was swept clean, and the oil poured on by means of cans, and brushed over so as to saturate the surface uniformly. In about twelve hours thereafter the road surface was dry enough to take the traffic, and not a single complaint of damage done to the paint of any vehicle thereby has been made. These experiments, comprising nearly one and a half miles of roads of fair average width, cost about $100 per mile, which is considerably less than was expended on the Long Island roads. The various applications took place between May 31 and June 23 last.

In the case of westrumite, for a very considerable time after the application there was absolutely no dust raised by vehicles of any description passing over the road, and three months after the application there was none to speak of, while the fact of the application having taken place over metalling of various stages of wear has demonstrated that on the older portions the tendency to dust is greater, as it is there that it has begun to show most.

On one road the surface became glazed and somewhat slippery, and some complaints were made regarding this. On the other road there was not the slightest tendency to this whatever. It is believed that the hard metal used on the latter is more suitable than that used on the former. It is also observed that specially good results were got on newly metalled surface where the material taken from the old surface was used for blinding, and that this observation is applicable to the results from both of the oils experimented with.

In the case of the crude oil the results obtained from the different stages of wear of road surface are not so noticeable. This material is most effective, but for the first week or ten days after its application, especially if wet weather prevails, it is not so clean as the westrumite; neither is it so easily applied, nor so clean to handle. There is one point in its favor, viz., that one application suffices for a season. With the westrumite several applications are necessary, at intervals varying according to the nature of the weather and the condition of the road.

The experiments have been so far successful, and have demonstrated the efficiency of the materials used for the purposes of dust prevention.

The Innkeeper and the Inquisitive.

They are a pretty curious set of people down Rhode Island way, as the following makes plain. Incidentally, the incident sheds light on one more disadvantage of the numbering system:

The proprietor of a popular roadhouse in Warwick, near Providence, has been greatly annoyed by the idle curiosity displayed by some automobilists as to the identity of others who patronize his place.

It is quite natural for a man who, being out for a turn in the evening with his wife, drops into the resort in question for a cooling drink or a little luncheon, to prefer to remain incognito. If some one's else wife accompanies him, it is more than natural that he should want to keep his identity to himself. But when the automobiles run under a shed, from which the registery numbers shine forth for all to see, like a good deal in a naughty world, it is the easiest thing in the world for some other party to drive up, look over the numbers and when out on the road pull out a registry book, find out the names of the persons who owned the machines and cause them a good deal of discomfort over the telephone the following day:

This, according to the roadhouse keeper, has been a favorite pastime ever since he took hold of the place, and he gave a good deal of thought to meeting the difficulties. Finally he evolved a scheme. Nowadays, when inquisitive people seek to learn, by looking at registry numbers, who is in the hotel, they find the number plates covered with a bag, which effectually thwarts their sinister designs.

SPEED CARS MINIMIZED

How the Touring Car is "Coming Into Its Own" and to Good Purpose.

One of the most encouraging signs of the times is the growing interest being taken in the touring car, says the Motor Review, Paris. Any attempt, even so recently as a year ago, to organize meetings devoted solely to touring vehicles would have run a very good chance of proving a failure. In hill climbing and speed tests the performances of the ordinary cars were regarded as an introduction to the more exciting part of the programme, when the high powered machines, with their skeleton frames and huge motors, suggested just enough peril to keep the nerves of the spectators at high tension. Touring car events were too amateurish to be taken at all seriously. The public are now showing a more rational interest in motor car trials, and if the sporting instinct is still uppermost, a growing acquaintance with the automobile has awakened in them a desire to keep in touch with its technical progress. It is this which explains the success of the recent hill climbing trials at Chateau-Thierry, when the vehicles competing had to be of the ordinary commercial touring type, certified by the makers as belonging to their standard patterns, and as selling at the prices marked on the programme. Close on seventy vehicles were presented on that occasion, and they offered an excellent opportunity of comparing and judging of the improvements that are being made in the French touring car.

As a special competition had been arranged in connection with these trials, when prizes were offered for the best carriage bodies, it might have been expected that makers would have presented some interesting novelties. It must be confessed, however, that much less has been done in the way of creating new patterns than might have been supposed. It is true that there were some highly luxurious limousines on the Radia, Berliet and Aries chassis, and that the carriage work was of an excellent quality on most of the vehicles. But what is wanted is a greater variety of patterns for ordinary cars. The purchaser of a high priced car can go to any big carriage builder, who makes a specialty of automobile bodies, and select designs that meet all his requirements as regards, elegance, comfort and finish. These bodies are fitted up with every possible convenience, and make motoring a pleasure in sunshine or rain, in dust or mud. The owner of such a car has no need to dress himself like an Esquimau in winter or carry about with him a full wardrobe in summer. The buyer of a much lower priced car cannot, of course, expect to get the same luxuries, but he ought at least to procure bodies that will offer him the same protection.

Among the cheaper cars assembled at Chateau-Thierry there was a singular absence of originality in carriage design.

Digitized by Google

With the exception of a few double phaetons, they were all of the tonneau type, generally with front entrance by a swivel seat. The limousine, which seemed likely at one time to supplant the tonneau, is usually reserved for the more expensive cars. The difficulty lies in the fact that as soon as an attempt is made to design and build bodies for moderate priced chassis offering adequate protection to the passengers, the purchase price is considerably enhanced. The problem of providing a cheap and practical form of body is becoming increasingly important now that motoring is almost as active in winter as it is in summer, in the sense that owners employ their cars for general use all through the year. Winter driving has entirely lost its drawbacks with the introduction of non-skidding bands and other devices that contribute to the safety and comfort of the motorist. A satisfactory feature of the touring car is the improvement observable in its general appearance. Owners no longer care to distinguish themselves by driving about in chromatic vehicles, which, however dazzling they may look in their display of red, yellow or green, have an appearance of being a little too aggressive. These colors have happily been toned down, and we were particularly struck by the neatness of the De Dietrich, with its bonnet painted and veined in a yellowish brown color like the body, suggesting the natural wood. These are little matters, but they help toward an improvement in the general appearance of the car.

It is in the light and cheap class of vehicles that improvement is most needed. These little cars have less chance of making the same progress as the bigger carriages, because they do not receive anything like the same attention, it being an almost general rule that as soon as a new firm have taken their stand in the industry as manufacturers of small cars they drift insensibly into the construction of large vehicles. The small motor car is too often regarded as merely a stepping stone to the more expensive carriages. This is a great mistake, and is responsible for many of the shortcomings in the automobile industry. The maker goes in for big cars because he finds that the only means of successfully doing a business in small vehicles is to reduce the cost of manufacture by a heavy production, and as the small car is a specialized branch, needing considerable capital, there are very few firms in a position to follow it up. Thus the small car continues with very little change in its general lines. It is almost always constructed to one pattern, and there is really nothing to show that it is the best, while there is often an excessive lightness about the steering gear, brakes and other parts that does not favorably impress buyers on the lookout for vehicles capable of doing hard work. The problem of the small car must be seriously tackled in the early future if the automobile industry is to settle down on a solid and profitable basis.

In the biggest types of vehicles there is a considerable improvement as regards roominess and comfort, although, as we have said, the thing chiefly lacking is a sufficient variety of bodies offering protection to passengers. Up till recently the design of the touring car has been following the lines of the racing vehicle, in the sense that it is given a very low centre of gravity with a long wheel base. As is usually the case, these features, very desirable in themselves, have been exaggerated until there is a clearance in many cases of not more than four inches between the crank chamber and gear box and the road, while the wheel base of nearly ten feet puts such heavy strains on the frame that even in the case of pressed steel frames it has been found that they sometimes permanently deform as the result of the violent shocks when riding over drains and obstacles at high speed.

If acetylene lamps are to be expected to give satisfactory service, the gas generators should be thoroughly cleaned every time they are filled. A good way to do this is to use a hose and water under pressure, compressing the end of the hose so as to make the water stream out forcibly. See that all the residue is thoroughly removed from the generator before refilling with carbide.

The Maxwell

PERFECTLY SIMPLE — SIMPLY PERFECT

The Keynote of Maxwell Construction is Simplicity.

The minimum number of parts have been used, but into each the brain of the designer has put such thought, such study, that a maximum of practical value has been attained in each detail.

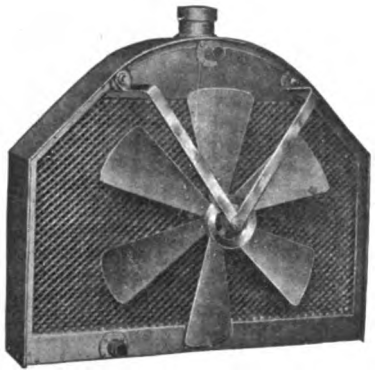
The Maxwell has no pump (thermo-syphon). Its crank and transmission case are cast in one piece of aluminum, and the double-opposed motor is so attached that they form a perfect whole. It is unnecessary to lift floor-boards or crawl under the car to get at any of the vital working parts.

The Maxwell, on account of its correct design and perfect workmanship, is exceptionally quiet, easy running and vibrationless. In every quality it is a car that will serve you well year in and year out, a practical car for practical people.

The Maxwell plant cost over $350,000, and has the most complete equipment of automobile machinery in the world. It is *not* an assembling plant, but one where every part of the Maxwell Automobile is actually made under the direct supervision of its designer, Mr. J. D. Maxwell.

This concentration of energy under one roof puts us in a position to promise our customers that promptness of delivery and absence of red tape that so often hampers the agent in making sales.

Although a new firm, the Maxwell-Briscoe Motor Co. is old in experience. Both Mr. Maxwell and Mr. Briscoe have been closely allied with every improvement in construction since the invention of the automobile. For twelve years they have been steadily working toward the completion of this car. Everything that patience, brains, and capital can do, has been put into its construction—the result is perfection.



Write us for information.

MAXWELL-BRISCOE MOTOR COMPANY, - - Tarrytown, N. Y.

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builders have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of cools is worth something to our customers.

We are now shipping coolers on our 1905 orders.

THE WHITLOCK COIL PIPE COMPANY

HARTFORD, - CONNECTICUT.

Extemporizing a Spring.

A spiral spring for a valve or other purpose may be made out of a piece of unannealed steel wire—such as piano wire—carefully turned round a metal rod of proper thickness, and care being taken to preserve between the turns a regular distance equal to that of the spring to be replaced. It is easier to make a spring of this kind by turning the rod on which the wire is being wound than by turning the wire round the rod. When the first of these methods is adopted a brace can be utilized, a tool found pretty well everywhere. If a spring is not to be subjected to heat an unannealed brass wire may be used—that is to say, one having all the elasticity possible. Such springs are quite evidently not of such value as the tempered springs obtainable from makers of such articles, but while waiting to procure the latter those improvised as directed above will be good enough to help one out of a difficulty.

When Nuts or Bolts Go Wrong.

If one is obliged to drive with a defective bolt, it may be made secure by flattening slightly with a hammer on an anvil, a stone or other hard material, so that the nut will hold for some length of time. As a result of the hammering the bolt will be sightly oval and the nut grips on the threads of the greater diameter thus created. If it is the nut that is stripped it should be made slightly oval by means of the hammer, but if of iron it may readily crack, wherefore tap lightly. Sometimes a stripped nut may be made to hold for a time by twisting tow around the bolt before screwing up. Nuts may also be retained in position by wetting the part with spirit of salts, but the same end may be attained by slightly riveting the end of the bolt.

One Cause of Porcelain Breakage.

A frequent cause of breakage in the porcelain of a sparking plug is the excessive tensioning up of the plug holding the porcelain in position. This should only be screwed up—if one may use the expression—"hand tight," it having been found from experience that a plug so treated is practically everlasting. A frequent cause of a short circuiting in wet or foggy weather is caused by damp becoming deposited between the fly nut holding the high tension wire across the porcelain of the plug, and so to the frame. This may be avoided by winding insulating tape from the porcelain of the plug to the insulating rubber of the high tension wire, then treating the cross wire terminal on the contact breaker in a similar fashion.

A washer can be improvised out of a number of things—a piece of sheetiron, a metal button, an old nut, if a thick washer is wanted; with a piece of wire of suitable thickness a ring can be easily and rapidly made, which will be found to fulfil the purpose, besides being a simple operation for any one.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—1904 White Touring Car with top, gas lamps and side baskets. Car guaranteed first class shape; $1450.00. Reason for selling—buying 1905 Model "White." Address T. W. J. SUITE, 28 Manhattan Blk., Cleveland, Ohio.

WANTED—Fifteen to twenty traveling salesmen by a well-known and established tire manufacturing company, making standard goods. Only active men who know how to work effectively and all the time need apply. Exceptional opportunity for men of the right sort. Address, TIRES, P. O. Box 649, New York.

The Week's Patents.

774,725.—Cylinder cooling system for internal-combustion engines. Charles W. Hart, Charles City, Iowa. Filed April 3, 1903. (No model.)

Claim.—The combination with the cylinder of an internal-combustion engine of a jacket partially inclosing said cylinder; a radiator comprising an oil-chamber having its upper and lower portions connected with the jacket and provided with a series of tubular air-passages; a hood connecting the upper ends of said air-passages and provided with a discharge passage leading to the exterior; and a duct leading from the exhaust-port to, and discharging into, the hood in the direction of said discharge passage, said radiator oil chamber and cylinder jacket being filled with oil and hermetically sealed substantially as described.

774,758.—Electric spark-gap. Thomas B. Kinraide, Boston, Mass. Filed May 25, 1904. Serial No. 209,686. (No model.)

Claim.—In an electric spark-gap, having opposite discharge electrodes, heat separating means consisting of a series of thin members of heat-conductive material extending laterally outward and located contiguous to the discharge-gap for diverting and separating from the electric current the heat effects and providing a cool discharge between said electrodes.

774,771.—Self-propelled vehicle. Chester B. Mills, Wilkinsburg, and Anthony Williams, Pittsburg, Penn. Filed June 20, 1903. Serial No. 162,373. (No model.)

Claim.—In an improved vehicle, running gear, a frame and a body separately mounted thereon, separate springs for the frame and body, and a vertically sliding connection between the frame and body.

774,790.—Pneumatic tire. Edward H. Seddon, Broklands, Eng. Filed Nov. 24, 1903. Serial No. 182,538. (No model.)

Claim.—A pneumatic tire provided with an inflating valve, adapted to fit a felly having an annular groove in one side at the corner and having annular flanges projecting above the felly, one of which flanges partly covers the said groove and is detachable, which tire consists of an annular tube having a flat bottom adapted to sit upon the felly between the annular flanges, an annular joint at one side of the bottom and an outside flange formed at the edge thereof, a "dovetail" head formed upon the inside margin of the other side of the tire at the joint adapted to enter the said groove and bear against the other flange of the tire when the detachable flange of the felly is secured thereto substantially as and for the purpose herein described.

775,009.—Vehicle wheel. Ralph Lancaster and Joseph H. Lancaster, East Orange, N. J. Filed Jan. 20, 1904. Serial No. 189,789. (No model.)

Claim.—A vehicle wheel comprising inner and outer hubs provided with lugs, the lugs on one hub overlapping and alternately arranged with respect to the lugs on the other hub, and a separate elastic cushion or ball inserted between each two consecutive overlapping lugs.

775,103.—Internal combustion engine. James F. Duryea, Springfield, Mass. Filed Dec. 22, 1902. Serial No. 136,168. (No model.)

Claim.—The combination with an internal combustion engine, having an adjustable inlet valve and a carbureter operatively connected with the engine through said valve, of means for adjusting said valve, and connections between said valve adjusting means and a part of said carbureter, whereby the adjustment of the valve may be effected independently within certain limits, and whereby beyond these limits, the valve adjustment and the adjustment of the carburetter may be effected coincidently.

775,120.—Explosion motor. Fritz Henriod-Schweizer, Marin, Switzerland. Filed Dec. 10, 1902. Serial No. 134,807. (No model.)

Claim.—In an engine, the combination with the cylinder, the explosion chamber, and the feedpipe, of means for forcing a current of air over and in contact therewith, and side plates provided with deflecting ribs adapted to prevent the diffusion of the air current and to direct the same upon the parts subject to heating.

775,150.—Automobile. Soren C. Rockman, Philadelphia, Penn. Filed Jan. 21, 1904. Serial No. 190,065. (No model.)

Claim.—An automobile having a main frame, a truck frame pivoted beneath the forward end of the same, a pair of steering wheels and forward and rear pairs of driving wheels, the forward pair of driving wheels and the steering wheels being carried by the pivoted truck, the main frame extending over all of said wheels and the connection between the main frame and the truck frame being so disposed as to distribute the weight evenly upon the three pairs of wheels, substantially as specified.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 38 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

RIM LIFE

means

TIRE LIFE.

"SWEDOH"

Spring Steel Rims

are long-lived.

Their use insures long-life to the tires to which they are fitted.

The composition of "SWEDOH" SPRING STEEL is peculiarly adapted to automobile rim building. There's just the right proportion of toughness to keep the rims round and just enough spring to soften the shocks to which a rim is subjected.

"SWEDOH" SPRING STEEL RIMS are now used by most builders of high-class cars, and are heartily indorsed by all tire manufacturers.

1905 MODEL WILL BE AN **EXACT** REPRODUCTION OF THE 40-45 H. P. MERCEDES,

built by the Parent Company

THE DAIMLER-MOTOREN-GESELLSCHAFT, OF GERMANY.

THE DAIMLER MANUFACTURING CO.

controls all the foreign patents of the Parent Company for the UNITED STATES and CANADA.

Descriptive Catalogue will be Ready for Distribution Early in January, 1905.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

GOODRICH TIRES

last through a season of hard racing and still in good condition.
Other tires on the same tracks were barely good enough for one heat.
Racing tires must be of the strongest construction. All GOODRICH tires are racing tires.

The B. F. Goodrich Co., Los Angeles, Cal. Oct.6,1904.

Akron, O.

Dear Sirs:-

I am indeed glad to place myself on record as an ardent advocate of your Goodrich Clincher Tire with which I have had four years experience in direct competition with other makes of tires and I truly believe them to be absolutely the best clincher tire on the American market today.

I used a set of Goodrich tires which had been put on my machine at San Francisco in November 1903 and which tires I used for three days hard racing at Ingleside where the car won its first race over Barney Oldfield; it was then shipped to Los Angeles and did two days hard racing here giving Oldfield a hard chase for his money on two occasions; the same car was used nearly every Saturday during the summer and then shipped to Del Monte where it raced two days fast racing winning the two open events with every mile better than 1.04; it was then shipped again to Los Angeles and I can truly say that these tires are still in good condition and ready for more fast work at the coming meet Oct.21st. These tires have never once had a pump put on them after being fitted to the rims at San Francisco last year. All other makes of tires were repeatedly replaced between races and heats at Del Monte; at least six times on one particular car where four different makes of tires were used, none of which I am glad to say were Goodrich.

Yours very truly,

WHITE GARAGE

KNOX Waterless Commercial CARS

Are the Highest Type of Delivery Mode.

The artistic atmosphere is felt in every design; the architecture has that finishedness and permanency that indicate workmanship of the most skilled, most expensive calibre. Of course, beauty does not make a Commercial Car—but it is an integral part of present-day delivery service. And underneath this commercial magnificence there is the Knox mechanism, with an incontestable record for reliability—unapproached and unapproachable by any other make.

If you want the quickest, the most reliable, the most beautiful and the cheapest method of local delivery select a Knox. There is evidence of it at agents' or from us.

The Maxwell

PERFECTLY SIMPLE — SIMPLY PERFECT

The Keynote of Maxwell Construction is Simplicity.

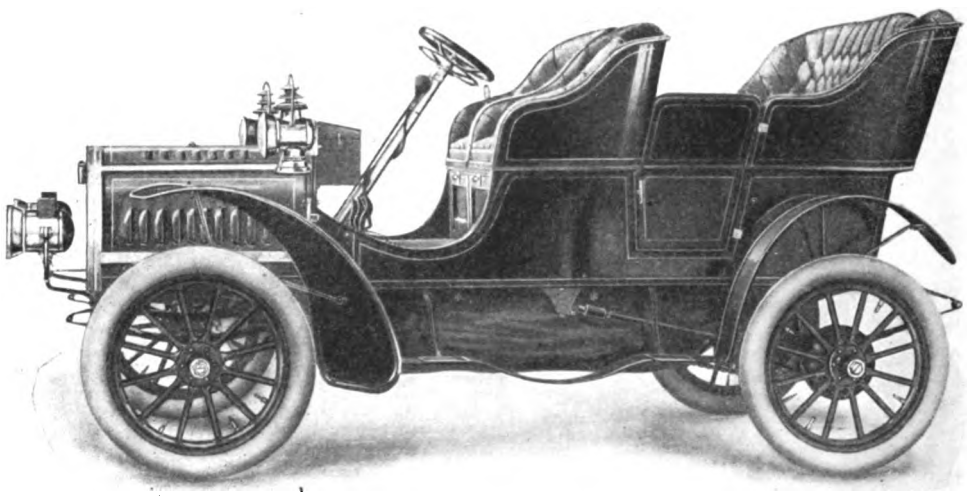
The minimum number of parts have been used, but into each the brain of the designer has put such thought, such study, that a maximum of practical value has been attained in each detail.

The Maxwell has no pump (thermo-syphon). Its crank and transmission case are cast in one piece of aluminum, and the double-opposed motor is so attached that they form a perfect whole. It is unnecessary to lift floor-boards or crawl under the car to get at any of the vital working parts.

The Maxwell, on account of its correct design and perfect workmanship, is exceptionally quiet, easy running and vibrationless. In every quality it is a car that will serve you well year in and year out, a practical car for practical people.

The Maxwell plant cost over $350,000, and has the most complete equipment of automobile machinery in the world. It is *not* an assembling plant, but one where every part of the Maxwell Automobile is actually made under the direct supervision of its designer, Mr. J. D. Maxwell.

This concentration of energy under one roof puts us in a position to promise our customers that promptness of delivery and absence of red tape that so often hampers the agent in making sales.



Although a new firm, the Maxwell-Briscoe Motor Co. is old in experience. Both Mr. Maxwell and Mr. Briscoe have been closely allied with every improvement in construction since the invention of the automobile. For twelve years they have been steadily working toward the completion of this car. Everything that patience, brains, and capital can do, has been put into its construction—the result is perfection.

Write us for information.

Rambler

SURREY, TYPE ONE. 1905 Model.

2 CYLINDERS, 16 H.P., $1350. IMMEDIATE DELIVERY.

Thursday afternoon, October 13, Arthur Gardiner, whose name was formerly well known on the cycle track, and who now is final tester of every RAMBLER car made, drove the writer in a new Surrey, Type One, for a twenty mile run about Kenosha. The country is perfectly flat, and the black soil makes poor roads, deeply rutted, so that this high speed run furnished no hill climbing, but plenty of spring and power testing, as a narrow, deep rut made by farm wagons in soft roads pinches pneumatic tires, and tests the springing by side crooks. Part of the time the car had four passengers and part of the time it was on very bad, soft, muddy, uneven roads, always riding very smoothly, without the slightest tremble of the free front ends of the mud guards, which is most convincing proof of entire absence of vibration, and always with abundant power to spare. The car is as still as it should be, silencing perfect, no bouncing, easy side swing, and prompt response in every particular of control.—HUGH DOLNAR, page 86, *et. seq.* *Cycle and Automobile Trade Journal*, November, 1904.

We shall be pleased to send you a copy of THE RAMBLER MAGAZINE, and other printed matter, free, upon request.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, December 1, 1904. No. 10

FOR A PARTS SHOW

Discussion Finally Assumes Form—The Argument in Favor of the Departure.

What has been in the wind for some time, and met with more or less informal discussion, is to be brought up for official consideration at the meeting of the Executive Committee of the National Association of Automobile Manufacturers on the 7th inst., that is, the advisability of holding separate shows for complete cars and for parts and accessories, the latter in the late summer or early fall, say August or September. It is understood that, in advance of the meeting, a plan for such a show already has been submitted in writing to the members of the Executive Committee.

The matter has been brought to a head by the utter inability of the Association to meet the demands for space at either New York or Chicago. It is asserted that it is absolutely impossible to continue the shows on their present basis, not merely because of the increased number of makers, but because of the greater number of models and of the larger sizes of models which are now in vogue, and also because of the multiplication of accessory manufacturers.

The plan for the parts show embraces the display of chasses and commercial vehicles which, it is stated, will not hereafter be accorded space in the national shows, as now constituted. Those who advocate the parts show maintain that it will settle all conflicting ideas as to the proper date for the national shows, and that it will also enable the parts man to better prepare for the demands of the manufacturer and thus assure prompt deliveries and reduction of expenses for overtime and rush work on the part of all concerned.

It is also held that the development of the commercial vehicle requires actual demonstrations, such as are not possible in Madison Square Garden or at the Chicago Coliseum. The location of the exhibition of parts would be influenced by this consideration.

It is proposed that admission to the parts show shall be confined to tradespeople and such others as may be invited.

Fox on the Scent of $8000.

Graham and Fox are "out," and Fox has instituted suit for $8,000 against the Eisenhuth Horseless Vehicle Co., Middletown, Conn., with which his erstwhile partner in the Graham-Fox Co. has "taken sides."

It is the old, old story of a couple of men with a "wonderworker" finding a capitalist with a factory and after many weary months of trying to produce cars, of falling apart and then rushing to court. Eisenhuth was the capitalist and factory owner, and the Graham-Fox compound motor, which utilized the exhaust, was the "wonderworker." For about a year the work was prosecuted in the Middletown plant, but if more than one car ever was produced there is no general knowledge of it.

Some two months ago the factory came to a standstill and apparently there was "nothing doing" until last week, when Fox—Frank A.—filed his suit and attached the only "compound" car in evidence. Fox alleges breach of his contract, which was for a term of two years. It is charged, however, that he one day voluntarily left the factory and, failing to return within a reasonable time, was notified that his services were no longer required. His absence is claimed to have nullified his contract.

Cleveland Dealers Elect Officers.

The Cleveland Automobile Retail Dealers' Association, which was recently incorporated as the Cleveland Automobile Dealers' Co., last week elected the following as officers of the corporation:

President, Mr. Price, of Price Brothers; vice-president, G. F. Russel, Ohio Motor Car Co.; secretary W. S. Waite, White Sewing Machine Co.; treasurer, C. M. Brockway, Winton Co. Directors—The president, secretary and treasurer and Henry Chisholf, Chisholm-Phillips Co.; Ralph Owen, Oldsmobile Co.; W. N. Booth, W. N. Booth Motor Co.; A. L. Sopel and H. L. Moore.

Knox Opens In Buffalo.

The Knox Automobile Co. is opening a branch house in Buffalo—in the new Rich Building at Main and Tupper streets. Francis L. Thomas will be its manager.

FOR UNIFORM RATES

New York Dealers Agree on Figures for Many Services—The Chauffeur Problem.

At last the New York Automobile Trade Association seems on the point of doing something—of producing tangible results of a character to fully justify its hitherto tranquil existence. Its classification and rate committees have formulated a plan for securing uniform charges for the storage of cars, and for sundries and repair work. The report of the former is having the finishing touches put on it, and it is to be approved and put in force on January 1. In addition, the plan of maintaining a quasi employment bureau for chauffeurs has been found unworkable, and, in its original form, abandoned; a modified plan of keeping track of chauffeurs will, however, be maintained.

In a large part, the present activity of the Association is due to the employment of a paid secretary, Wm. P. Kennedy, who brings to the position a thorough knowledge of local conditions, an aptitude for detail work and a sufficiency of time to devote to the task of planning and carrying out the various schemes undertaken. Taken in conjunction with a more active interest in the work by the other officers and members of the Association, and a determination to accomplish something definite, the change has worked wonders.

At the last meeting of the Association, held at the Hotel Navarre on November 16, the Rate Committee, to which had been intrusted the task of framing a uniform rate schedule and issuing rate bulletins to be posted in members' garages, presented a report in which these recommendations were made:

First—That as far as it is posible all members make the storage rate on large tonneau cars twenty-five dollars ($25) per month; small tonneau cars, twenty dollars ($20) per month, and on runabouts with two seats only fifteen dollars ($15) per month.

Second—That a resolution be adopted by the members of the Association at the regular meeting to the effect as follows:

Resolved, That whereas cost of high grade

Digitized by Google

machine labor is steadily increasing in the automobile business during the last few years, and whereas the highest grade of men must be selected from other trades and drafted into the automobile business, and by reason of the difficulty of retaining high grade mechanics in the employ of the Association, owing to the inducements held out by owners of automobiles for them to become chauffeurs, it is unanimously decided that proper service cannot be given and a living profit given to the parties maintaining a high grade automobile business, at a ratio of mechanical labor at less than 75 cents per hour, and that this sum be from now on charged by all members of the Association, and customers notified to that effect. That a copy of this resolution be printed, signed by the Association, and names of the members printed below and furnished in quantities to each member for distribution.

Third—It is recommended that the standard rate for transition storage be $1.50 for any part of twenty-four hours, including one washing and one cleaning of brass (by transition is meant storage customers other than those who maintain an open charge account).

Fourth—It is recommended, for the reason that many expensive and high grade machine tools are apt to be ruined and made useless for further high grade work thereafter by incompetent parties, that use of the tools and machinery of the members of the Association be denied to chauffeurs or others not in the employ of the Association. This, of course, excludes the use of special benches and tool rooms fitted specifically for use of chauffeurs where such exist.

Fifth—The following infirmation regarding towing is placed before your Association by your committee: In towing customer's cars into your garage you are responsible for any damage inflicted either by the car towing or the machine towed or to either one of them; furtner responsible for accidents to pedestrians or the public in general and subject to suits for damage if any is inflicted. For this reason it may be stated that arrangements can be made with outside parties for towing if so desired. One member reports being able to make very satisfactory arrangements with the New York Transportation Company whenever a tow is required.

Sixth—It is recommended that a standard charge for machine oil (in which is included all of the lower grade oils for lubrication) be 40 cents, and for cylinder oil not less than 80 cents a gallon.

Seventh—It is recommended that not more than one locker be included in the contract price for storage of each automobile; that the charge for extra be $2.

The report was adopted with the proviso that it take effect on January 1. It was also voted to delegate to the Classification Committee the task of compiling a complete list of charges to cover every car carried in New York, and submit it for action by the Association at its next meeting, which will take place next week. This list will, in effect, take the place of the first paragraph in the foregoing report. Its purpose is to put an end to all haggling and dispute over storage charges by fixing a specific charge on every car that is likely to be brought to any member of the Association. A question may arise as to whether a car is a runabout or a small tonneau, or where the line of demarcation is between a large and a small tonneau. Taking advantage of this an owner may go from one garage to another, asking rates and pitting one dealer against another. By adopting a flat rate for each car this will be avoided; a dealer has but to consult his list to see what the charge should be. The Classification Committee has its schedule prepared, and the charges range from $15 up. Odd figures, such as $17.50, $22.50, etc., appear on the schedule.

As stated, the Association has also threshed out the chauffeur problem pretty thoroughly and decided on its future course. It will be recalled that some time ago the experiment was tried of having chauffeurs in search of jobs fill out blanks and send them to the secretary. These blanks contained the names and addresses of the employment seekers, their record, evperience and a mass of other details. Whenever a member of the Association or one of his customers wanted a chauffeur requisition was made on the secretary, who fished out some of the most likely blanks and sent copies of them to the inquirer.

The plan worked only indifferently well. When it was sought to elaborate it and to make it more valuable and useful, with the idea of making a small charge for the work, the Association found itself running counter to the city License Bureau. Such a plan, the latter claimed, was equivalent to conducting an employment bureau. To do this a fee of $1,000 would have to be paid and comprehensive and regular reports from the Association would have to be made. This being so, it was decided to relinquish the idea of elaborating the system.

This decision carried with it a change in the method in use also. It was found that very few of the desirable chauffeurs made application by means of the blanks; it was the ne'er-do-well kind that did so, and the impossibility of examining each case, which it was intended to do if the plan of charging a fee had been adopted, made the whole system a most unsatisfactory one.

In the future, therefore, a list of chauffeurs will be kept by Secretary Kennedy—not a blacklist exactly, but a list of men regarding whom it is wise to make inquiry. If a member of the Association desires information regarding one of these men the secretary will put him in touch with another member who has knowledge of the chauffeur and let the two exchange views.

It is not held, either by Secretary Kennedy or the Association, that this is a satisfactory solution of the matter. Any solution seems at present impossible of attainment. Some good will undoubtedly be done by the present arrangement, and there is a probability that the local Y. M. C. A., which is at present conducting an automobile school, will apply itself to the task of bringing about an improvement in the methods of supplying chauffeurs. It is even a possibility that an employment bureau will ultimately be established.

Small Failure in New York.

A petition in bankruptcy was filed last week against the General Automobile and Repair Works, of 764 Eleventh avenue, this city, by the following creditors: William J. MacFarquhar, $400; John J. Ivory, $100, and Stefano Greco, $3. It was alleged that on November 25 the corporation admitted in writing its inability to pay its debts.

The corporation was organized under New York laws, with a capital stock of $1,500, with Charles Lein as president and treasurer.

On Monday Judge Holt, of the United States District Court, appointed Pratt A. Brown receiver for the company. His bond was fixed at $1,000. It is stated that the concern has liabilities of $4,000, divided among thirty creditors, and $2,000 of assets. The latter consists of machinery tools and accounts.

Two Where but One Existed.

The Wheeler Mfg. Co., Detroit, have disposed of their bicycle saddle business to a new concern, the Wolverine Leather Specialties Co., Detroit, of which Walter Thorn is president and general manager and A. B. Packard secretary and treasurer. The Wheeler company will continue on a much larger scale the manufacture of their several styles of tops, and will make in addition a full line of storm aprons, hampers, brass trimmings, covers, etc., and will also carry a full jobbing line of other accessories.

The Wolverine Leather Specialties Co. will continue the name "Wheeler" on the saddle, and will also produce a complete line of specialties in leather for the automobile and carriage trades.

Unwin Gets a Good Start.

Harry Unwin, after a term of service in the sales department of the Olds Motor Works, is again in New York and in the Journal Building, Broadway and Fifty-ninth street, has just hung out his shingle as the Harrolds Motor Car Co. He will handle the Olds and Pierce Arrow cars, from which names, assisted by his own prefix, the title of his establishment is compounded. The store occupies the entire Broadway front of the Journal structure and practically facing the entrance to Central Park, is one of the choicest locations in the city. Unwin's financial sponsors are Steiner & Sons, wealthy night shirt manufacturers, who have put a large block of capital into the business.

Adams Gets the Corbin.

The New York agency for the Corbin car has been placed with well known George B. Adams. The location of his salesroom has not yet been selected.

KNOX UNVEILS 1905 LINE

Two New Models Embody a Number of Changes—Power and Weight are Reduced.

For 1905 the Knox line will consist of two entirely new models—a runabout convertible into a four passenger vehicle, and a side entrance tonneau. Both are handsome and attractive appearing cars, and differ markedly in outward semblance from the 1904 models, although the design and construction of engine, transmission, etc., of the latter has undergone no material change.

The two models are identical in all essential respects except the bodies. The power plant of each consists of a 14 horsepower double opposed horizontal engine, positioned centrally and driving through a central chain to a live rear axle; the 1904 double cylinder cars developed 16 horsepower. This power reduction is occasioned by the use of 5x6-inch cylinders in place of 5x7-inch, as were used this year. A proportionate reduction in weight —from about 2,700 pounds to under 2,000 pounds—more than compensates for this diminution of power, while the decrease in piston stroke is in line with the latest trend in engine design.

Both models are constructed with square bonnets, which, although "blind," are indistinguishable from the regulation engine housing bonnets seen on cars with vertical motors. Wheel steer is another change from Knox methods of the past, and the engine itself has been improved by some changes in valve construction. The side entrance tonneau car is a roomy and luxurious looking vehicle, while the runabout is, as stated, convertible to a four passenger car by means of an ingenious arrangement whereby the rear part of the body is opened up to make a cushioned seat.

The price of the runabout is $1,700 and of the side entrance car $1,850.

Two Models from Michigan.

The Michigan Automobile Co., Kalamazoo, Mich., will market two cars next season, Models D and E, as they will be styled. Model D will be substantially the same as this year, with the addition of a French bonnet. Model E will be a side entrance car, the body being of very handsome design, with divided front seat. The wheel base will be 86 inches, wheels 30 inches, tires 3½ inches. Model D, with 3½ inch tires, will sell for $1,100, with 3 inch tires, $1,050. The price of Model E will be $1,250. Both cars will be equipped with a two-cylinder horizontal motor of 14 horsepower.

Duerr Takes on the Pungs-Finch.

The Pungs-Finch car is the most recent Detroit production to obtain entry to New York. The agency for it has been taken by the Duerr-Ward Co.

The Week's Incorporations.

New York, N. Y.—Union Motor Supply Co., under New York laws, with $25,000 capital. Directors—Rene E. Jarrige, Jesse J. Beeitler and Frederick C. Truckheim, New York.

New York, N. Y.—Harrolds Motor Car Co., under New York laws, with $30,000 capital. Directors, Edward J. Steiner and Edward Brand, New York, and Harry Unwin, Detroit.

Chicago, Ill.—McDuffie Automobile Co., under Illinois laws, with $2,400 capital; to manufacture and rent automobiles. Incorporators: J. H. McDuffie, W. E. Harvey, H. L. Babcock.

Jersey City, N. J.—National Automobile Co., under New Jersey laws, with $250,000 capital; to manufacture and sell automobiles. Corporators: Louis B. Dailey, H. C. Coughlan, B. Stafford Mantz.

Detroit, Mich.—Hammer Motor Co., under Michigan laws, with $10,000 capital; $1,000 paid in cash, $2,000 in patents, etc. Stockholders: Henry F. Hammer, Leon J. Pasyki, Foster W. Allen and Harry W. Nicholds.

St. Louis, Mo.—Union Automobile Mfg. Co., under Missouri laws, with $12,000 capital, full paid; to manufacture and sell automobiles. Stockholders: Benjamin B. Hulbert, Geo. H. Martin and Geo. B. Louderback.

Columbus, O.—Automobile Garage Electrical Construction Co., under Ohio laws, with $5,000 capital. Incorporators: C. A. Rosa, J. B. Rhodes, E. F. Triplett, A. A. Douglass, O. A. Osborne and L. R. Slocomb.

Detroit, Mich.—Wayne Automobile Co., under Michigan laws, with $300,000 capital; $8,200 paid in cash, $240,000 in stock of automobiles valued at $43,331.06, goodwill of the business, inventions, etc., of William Kelly, valued at $172,561.94, and other property of the old partnership concern. Incorporators: Charles L. Palms, William Kelly, Roger J. Sullivan, J. B. Book and E. E. Skae.

To Settle a $20,000 Wager.

Maurice Fournier has started on a 4,600 kilometre tour through Europe in an Oldsmobile. He is making the trip to settle a wager betwen Henri Fournier and M. Dertelle, of $20,000. The conditions were that any Oldsmobile in the Paris salesroom of Henri Fournier was to be selected at random and it was to cover the entire distance without undergoing substantial repairs. The route of the tour was as follows: Paris to Bordeaux, Toulouse, Marseilles, Nice, Genoa, Pisa, Rome, Venice, Vienna and Berlin, re-

Olds Interests Change Owners.

Charles P. Adams has purchased and taken over the Oldsmobile Co. of New England, which under the same style will be continued at 239 Columbus avenue, Boston. The purchase carries with it the Olds agency for Boston and that portion of Massachusetts east of Worcester County, Bristol excepted. Adams will appoint sub agents in his territory and will carry a full stock of Oldsmobile parts for which he is exclusive agent in New England.

HE SAW NO ROSE HUES

Frenchman, after Visiting England, Delivers Himself of Some Pessimistic Opinions.

British, and especially London, trade is in a very serious condition, if a French tradesman who has just visited the latter place is to be believed.

"Everywhere I went I saw the same condition of affairs, and every agent had the same tale—'nothing doing,'" he says. "In some of the largest houses business was at stagnation point, and even French machines seemed difficult to get rid of. A few Panhards were being sold, it is true, but then Panhards always sell well everywhere, so nothing can be judged from that. A very well known dealer told me that he was convinced the time was close at hand when a large number of the automobile dealers in London would have to put up their shuters.

"I went to London with the object of picking up a few ideas, but I got few. The only idea I did get was that the dealers in France had a good deal to be thankful for. While some of them may be in the same condition as the London houses, the majority can report excellent business, despite the lateness of the season."

Mahoning Will Make Air-Coolers.

At its annual meeting, held at Youngstown, Ohio, last week, the Mahoning Motor Car Co. elected the following officers:

President, L. E. Cochran; vice-president, W. J. Hitchcock; general manager and treasurer, W. P. Williamson; secretary, D. E. Webster.

The directors decided to build fifty cars, which will be ready for the trade next spring. The cars will be two and four passenger models, and will be equipped with a new air cooled cylinder invented by Charles T. Gaither. The machine has been tested the past few months and found to be entirely satisfactory.

To Build Steamers in Elyria.

The Hummell Engine and Mfg. Co. has been organized at Norwalk, Ohio, to engage in the manufacture of steam automobiles. The officers are as follows:

F. P. Hummell, of Bellevue, president; G. W. Driggs, of Elyria, first vice-president and superintendent; W. D. Daugherty, treasurer.

The new corncern will erect a factory at Elyria, and work on a large scale will be commenced next year.

Henley Heads for the Coast.

A. B. Henley, of the Electric Vehicle Co., has started on an extended tour of the trade of the Far West and Pacific Coast. He will call on the dealers of Denver, Ogden, San Francisco, Los Angeles, Portland, Tacoma, Seattle and other leading centres.

AT HOME OR ABROAD—

Wherever Fisk Mechanically-Fastened Tires are Used,

THERE WILL BE FOUND CONTENTED CUSTOMERS
AND THE FISK'S BEST ADVERTISEMENT.

HERE'S ONE SPLENDID INSTANCE OF THE SORT.

Copy of letter from Messrs. Charles Jarrott & Letts, Limited, of 45, Great Marlborough Street, Regent Street, W., to the South British Trading Company, Limited, 13-15 Wilson Street, Firsbury, E C., dated November 12th, 1904.

We have no doubt you have read the various accounts in the press of the successful finish of the 3,000 mile tour of the two Oldsmobiles, one 7 horsepower and the other 9 horsepower. The test to which these cars were subjected, and which they have successfully withstood, is without question an excellent tribute to their good qualities.

In this connection we think it but just that we give the Fisk Detachable Tires, with which these two cars were fitted, their share of praise. They stood up splendidly, the same covers being used throughout the tour. The cars were driven over all conditions of roads and in the lengthy travels encountered very severe weather, and although they traveled over roads which were altogether unsuitable for motor traffic, being practically beds of loose flint, the tires on the large car had only one puncture in each of the hind tires. The front tires were not touched from the time they were fitted to the car, which has by this time done between 5,000 and 6,000 miles. The Fisk Tires have come through the ordeal better than we had dared hope.

NEW YORK, DECEMBER 1, 1904.

The Use of Searchlights.

The automobile manages to make many enemies in one way or another. Some of the causes of enmity are unavoidable, some are unreasonable; but some can be avoided.

The use of intensely bright headlights and searchlights is in the later category; such lights constitute a positive danger to people coming toward them. If they do not blind they frequently bewilder. It is almost necessary for the one approaching to come to a stop. This annoyance may be avoided, certainly in part. One user of a powerful searchlight makes a practice, when coming near another automobile or carriage, to throw his light far to one side or directly upward. This applies to the powerful searchlight only.

For the headlight there seems to be no way at present to mitigate the nuisance. It remains for some clever inventor to arrange a shutter of some sort that can be closed momentarily and opened from the seat.

Automobilists travelling between Boston and Worcester on the main trolley thoroughfare have noticed that many of the motormen are very considerate and draw a shade over their electric searchlights when they see automobiles or other vehicles approaching.

It has been the experience of some that one good sized searchlight will do all that a pair of headlights will do for all ordinary purposes. If the use of a searchlight becomes general in this way, then the mere turning aside will entirely remove the trouble.

Air Cooling and the Frenchmen.

It has more than once been charged against the French that they are unable to see beyond the ends of their noses; in other words, they believe that the sum of human endeavor, so far as it relates to the design or manufacture of automobiles, is found in French cars. These incorporate everything that is good or right; what is not found on them is unworthy of consideration.

This sunny belief received a rude shock several years ago when the French found that other peoples—notably the Germans—could produce cars equal, or superior, to their own. But the old belief still survives. It is evidenced in the French attitude toward air cooled engines. The French makers found, years ago, that when the horsepower got up to 3 or 3½ some artificial means of carrying off the excess heat became necessary, and they tried water cooling, and made it practicable. Since then they have water cooled all except small bicycle motors, and they cannot understand how anybody can have the face to contend that cars can be driven by air cooled engines. They have no patience with such claims. That they can scarcely believe that engines of this kind can run was shown by the attitude of the French "experts" at St. Louis who were called on to pass judgment on American cars driven by air cooled engines. It was with the utmost difficulty that they could be made to believe that they could actually run!

The same intolerance and incredulity crops up in an article by H. Andre in La France Automobile on cooling methods. "From the point at which the power of the motor exceeds 2½ or 3 horsepower cooling by air becomes insufficient, and it is absolutely necessary for the good working of the motor to cool by means of water," he says.

Facts and figures avail nothing in the face of this dictum. The motors of half a dozen years ago could not be effectually cooled by air after they got to be a certain size; ergo, nothing to-day over 8 horsepower can be cooled by air, declares M. Andre. What boots it that there are cars in this country ranging from 3½ to 16 horsepower—one, two and four cylinder—cooled entirely by air to say the eminent Frenchman nay? What matters that they run efficiently and reliably, year in and year out, indistinguishable from the water cooled kind as far as results are concerned? They are not within the line of French vision, consequently they are non-existent, a figment of the imaginative American brain.

The Ormond Carnival.

If some of the stuff that was printed last week is to be accepted at its face value, the Ormond Carnival is in a precarious state. Its success is not dependent on the magnificence of its everlasting beach, but is held in the hollow of the hand of the "unselfish" manager of the meeting, for it is gravely stated that because he dared advise the Florida East Coast Automobile Association to throw the events open to the whole wide world, without first consulting the manager, President Burgoyne has been discourteous to the point of offensiveness, and it is as gravely intimated that further ruffling of the managerial feathers will be resented by certain of his cronies who are employed by certain publications. It is well that man shoulld stand by his friends, and when the particular man is in a position to supply "free grub, free bed, free everything," it may be twice as well to "stand by" with more than usual firmness.

But when any man or set of men would make it appear that such a now world important function as the Ormond Carnival reposes in the person of any one man, they become amusing. The fame of the Florida beach as a speed ground is secure for all time. Every effort to discover another course that will even begin to compare with it has failed, and so long as the Florida East Coast Association, or any other association, desires that contests of speed be held on the broad expanse it need not concern itself overmuch about men competent to manage them. The man responsible for the "discovery" of the beach and for the inception of the idea of such a carnival is deserving of every credit. "The man with an idea," whether it nets him a profit or whether it does not, is always welcome, but when he or his misguided cronies conceive him to be the "whole thing," and fancy that without him collapse must ensue, the danger point is reached.

Discourteous or otherwise, the best thing for the Ormond meeting that ever occurred

Digitized by Google

was the action of the promoting association in rescinding the motion restricting entries and in asking the world to participate. The idea that the carnival was a one-man affair, and chiefly aimed to bring boarders to certain hotels at a period when boarders are not numerous, was rapidly gaining lodgement. It required action of some sort to lessen this impression, and that action was taken at exactly the right time and in exactly the right way. It was in the interest of the "fair field and no favor" that is at the bottom of true sport. An event of the sort is not one to be used as a vehicle to settle individual grudges, and before many days, if they be wise, the promoters will see the need for a managing committee rather than a lone manager who "uses" the carnival in very many more ways than one. "Unselfish" he may be, as his friends allege, but when it is common property that while in the guise of an intensely patriotic member, and apparently for "the good of the cause," he was enlisting as members of an automobile organization his friends and business acquaintances, and was at the same time working for his pocket and sharing the fees that his friends and acquaintances paid, there are those who wish to be saved from such "unselfishness." The laborer is worthy of his hire, but there is a difference between laborers, patriots and Hessians.

On Keeping Busy.

Some dealers find it difficult to keep themselves and their employes busy during the winter months. They look to the annual shows to divide the closed season into two nearly equal periods, the pre-show time being devoted to talking about and preparing for it, and the post-show time to booking orders and getting ready for the opening of the driving season. Of these two periods it is during the first that time hangs heavy.

There is another class of dealers that never finds the days too long, even when the roads are snow or slush covered and driving is as near to a standstill as it ever gets. Some of them, indeed, complain that the days pass too quickly and that they find occupation for every minute of the time in preparing to do business when the season arrives. First they set their household in order—make such changes as the past season has shown to be desirable. The salesroom, the repair shop, the garage—all receive attention, and whatever improvements or additions seem necessary or desirable are made now, instead of waiting until the spring rush begins.

Next the selling campaign is mapped out, gone over, criticised, amended and finally whipped into shape. The list of possible or probable customers is corrected and added to and a little missionary work done in some of the more promising cases. Old customers are hunted up and interviewed to see if they have any grievance or trouble; and if such is the case the matter is straightened out in the best possible manner. They are urged to bring in their cars to be overhauled, so they will be ready for the opening of the riding season, instead of waiting until the last minute.

To look after such matters as these is no small job, and the dealer who does it thoroughly will find that time does not hang heavy on his hands.

Salesrooms That Help Sales.

One very noticeable and extremely gratifying tendency of the times is the trend toward exclusive salesrooms and away from the combined salesroom, garage and repair shop. It has been for some time evident that if the automobile business is to remain on a high plane some change must take place, and it has begun none too soon.

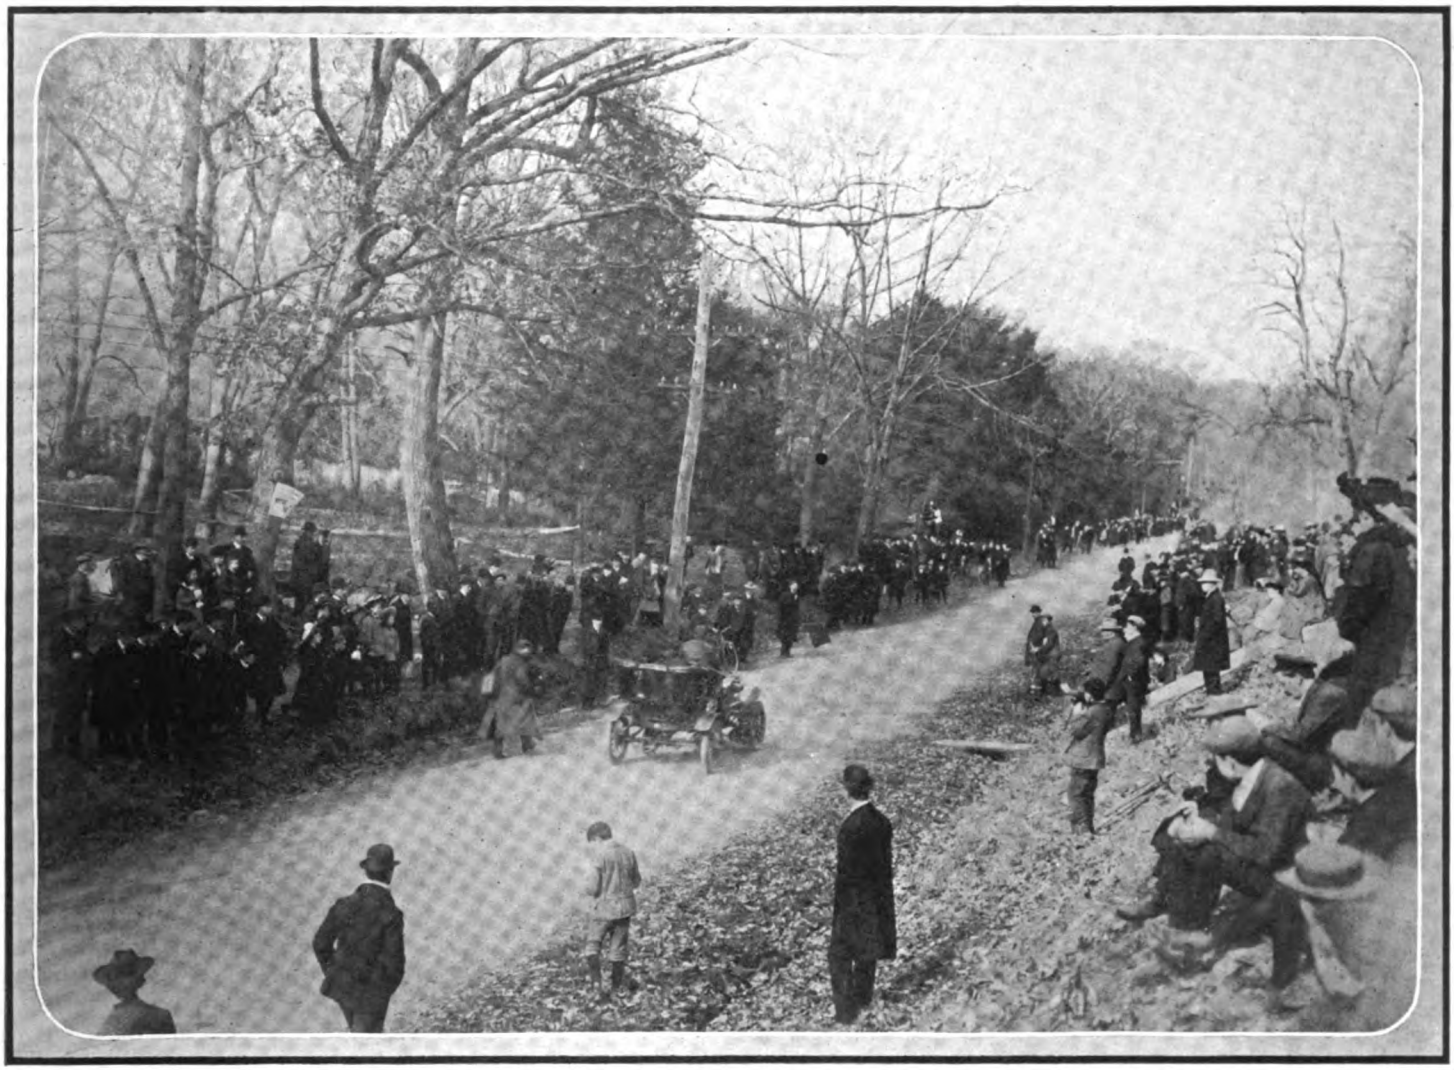
The people who make up the greater part of the clientele of automobile dealers take notice of their surroundings and are impressed, favorably or otherwise according to whether they are pleasant or unpleasant. In the past they have been disposed to overlook or condone shortcomings owing to their interest in the automobile and everything that has to do with it. But that time is passing, and in no great while it will be required that all places where automobiles are sold shall be clean and sweet-smelling, if not handsome and attractive as well.

There is really no reason why salesrooms should not be, as they are in a number of cases, entirely divorced from the garage and repair shop. While desirable, it is not even necessary that the latter should be in the same building. Salesrooms on prominent streets, where retailing is done on a large scale, are frequently much easier to obtain, and at a much lower rental, than quarters large enough to accommodate the entire business of an enterprising and progressive dealer. A plate glass front and floor space enough to accommodate two or three cars, chairs, divans, etc., and an office, are sufficient. Then the esthetic side of the business is alone presented, and no unpleasant reminders of accidents and break downs are held up before the prospective purchaser. There are times when this is a decided advantage, as those who have tried it know. But it is an absolute essential that the salesroom idea should be strictly adhered to; any slackness, such as temporarily disposing a demonstrating car there, or of making even trivial repairs, or permitting workmen or chauffeurs to congregate in the salesroom, proves fatal to the scheme.

The garage and repair shop can be maintained in the rear or on a nearby side street. Even if it has to be located at a distance no great harm is done, for the automobile's mobility bridges distance and makes it feasible to receive and ship without undue delay. Plenty of room is a requisite of an establishment of the kind, and the lack of it costs more than is represented by a little extra rent.

Tires in Winter.

It is popularly supposed that the winter driving is harder on tires than that of any other season of the year. Frozen roads, which are frequently covered with jagged pieces of ice, are assumed to cut and puncture tires and inflict a great deal of damage on them.



The belief is directly contradicted by some motorists who have given the subject attention. They say that it is the summer driving that is hardest on tires; that dry, dusty roads do the greatest damage to them. This is particularly true, they claim, in the case of macadam or other stone roads. The dry weather loosens the top dressing and leaves exposed a multitude of sharp stones, with jagged edges, and these cut the tires, puncture them and predispose them to boils, bursts, etc.

This view is, as stated, quite at variance with the prevailing belief. It also conflicts to some extent with the known fact that a wet tire is more susceptible to puncture or cutting than a dry one. To prove this it only needs to take a piece of rubber and see how much easier it is to cut when wet than when dry.

Motor Age remarks that after December 15 Secretary Gillette, of the A. A. A., will be overwhelmed with belated entries for the Bennett Cup race. It is just as well to bear in mind that the Automobile Club of America still has the bossing of the American end of this race, and if there are any belated entries they will find their way to Secretary Butler's hands. The A. C. A. is not going to let go of a good thing like the cup race until it has to and that it is competent to cope with the task is not to be gainsaid.

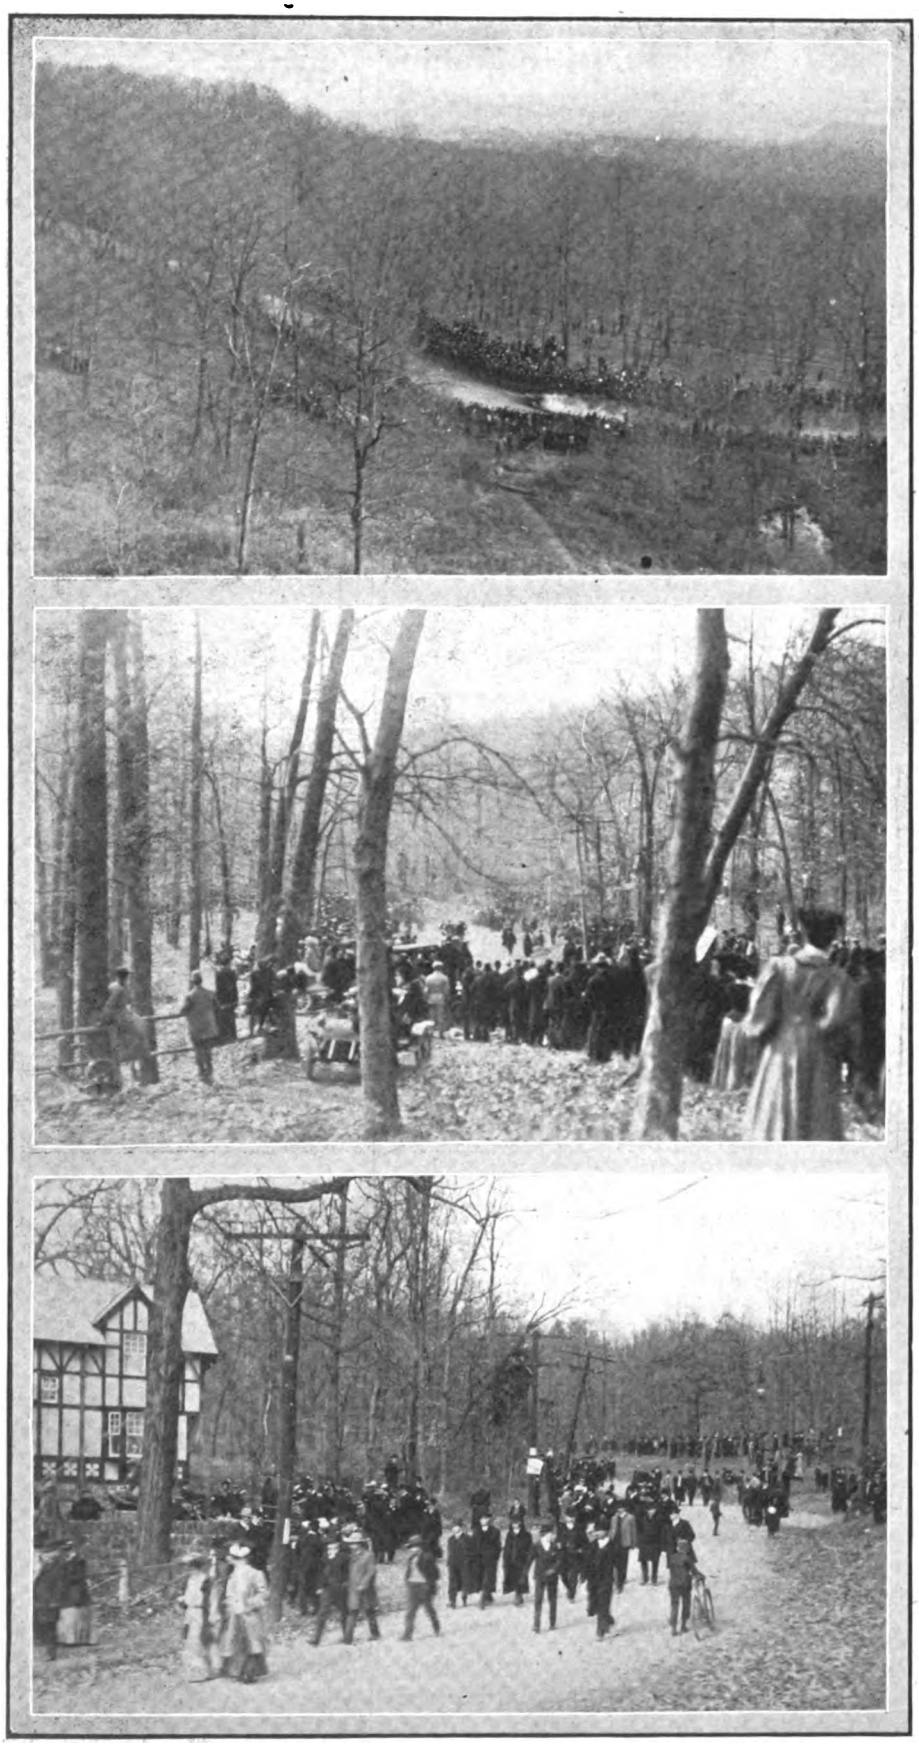
Up Eagle Rock—Greatest of American Hill-Climbing Contests.



In the presence of an enormous concourse of spectators, variously estimated at from 10,000 to 20,000, all previous hill climbing contests in this country were cast in the shade on Thanksgiving Day, at Eagle Rock, near Newark, N. J. It was the fourth annual contest held on the historic course, and new records of all kinds were marked up, some of which are likely to maintain their places for a long time. The promoting organization, the Automobile Club of New Jersey, showed itself to have a fine grasp of the situation, and, in conjunction with its officials, ably conducted the affairs and ran the long list of events off with such celerity that at a little after one o'clock the last trial had been completed and the participants and remaining spectators dispersed in ample time to partake of their Thanksgiving turkey.

The contest was a notable one in a number of respects. The most popular man on the course, the man whom of all others the immense crowd went to see, the hero of the 1903 contest, "Willie" K. Vanderbilt, Jr., went down to defeat at the hands of a daring and skillful professional driver; a defeat that was doubly harrowing because the premier position was lost, then regained, and finally lost again by the exasperatingly narrow margin of 3-5 of a second. Aside from this, and the keen and close competition of the octette of big cars, the feature of the day was the wholesale smashing of records. This was of such consistent character that when the finale was reached new figures had been marked up in ten of the eleven events; even the steam record for the course, which had stood since 1902, was obliterated, the new figures being scarcely more than one-half as much as the old ones. The single class to escape was that for cars costing between $1,250 and $2,000, and even that was beaten, strangely enough, by the cars in a cheaper class. With the exception of this and the class for cars under $850, the cuts were all big ones, and represent pretty closely the limit of speed possibilities on this hill. In a number of events too, there was a remarkable fluctuation in the performances of cars of the same class, and, consequently, of nearly the same rated power. This was most noticeable in two classes—those for cars costing between $850 and $1,250, and between $3,000 and $5,000. In the first mentioned class the variance was between 2.18 2-5 for the fastest and 5.25 1-5 for the slowest car, and in the other class the figures were 1.54 2-5 and 4.29 1-5 for the fastest and slowest cars, respectively. Ability to tak the hill, or the greatest part of it, on a high speed, undoubtedly had much to do with these diverse performances, as well as skillful driving; but even allowing for these, there is indicated an abnormal difference between rated and developed horsepower.

That the fastest time of the day—the 1.20 flat of M. G. Bernin in W. G. Brokaw's 60 horsepower Renault—is almost, if not quite, as fast as can be made on the mile long hill, with its average grade of 12 per cent. and its maximum of 19 per cent., seemed perfectly clear to those who stood at either of the two nearly right angled turns on the course. On them, and more especially on the second one, located only a few hundred feet from the finish line, the issue was staked and the battle won or lost. To them almost wholly was due the fact that 50 miles an hour was the fastest time that the best product of foreign or domestic factories could average, as against the 77 miles an hour accomplished on the celebrated Gaillon Hill in France. The latter is one kilometre long, with a grade varying from 7 to 10 per cent.;

Digitized by Google

THREE VIEWS OF THE CROWD.

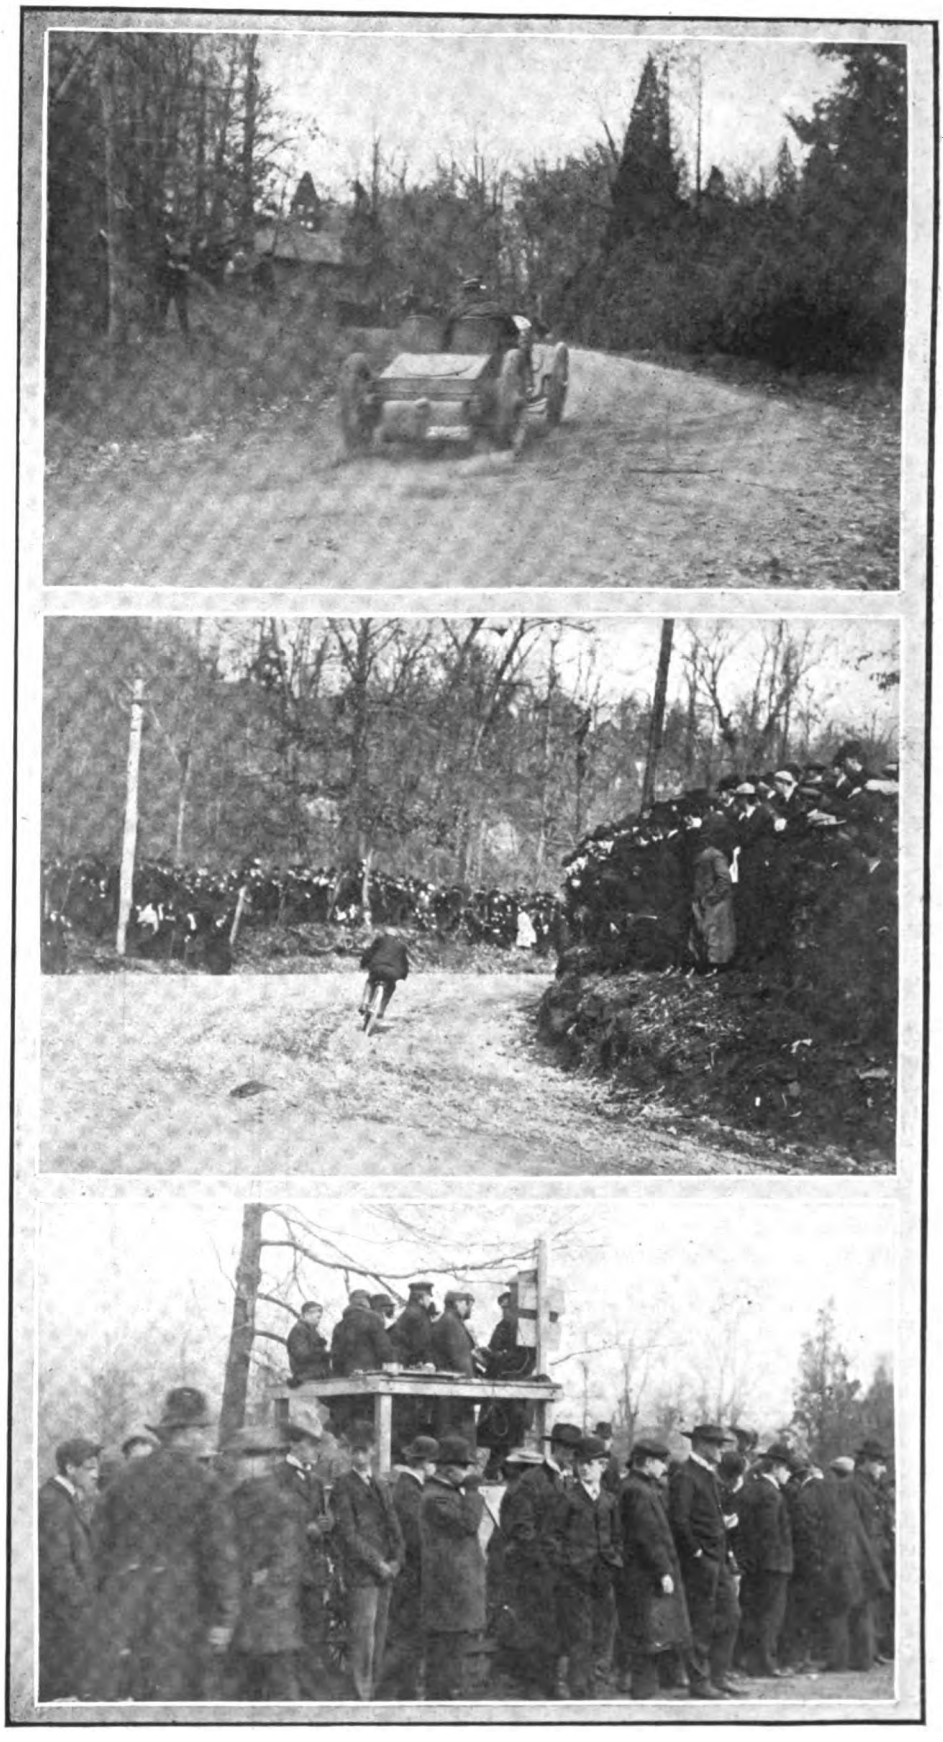
it is perfectly straight, with a smooth, hard surface. The phenomenal speed of 77 miles an hour is due to these conditions, and could not possibly be duplicated on Eagle Rock hill. On the latter the grade is considerably steeper, the surface much poorer and there are two exceedingly bad turns. On the straight stretches the big cars last Thursday were driven at tremendous speed—just as fast, in fact, as was possible without overrunning the turns. On the latter the clutches had to be thrown out to reduce speed sufficiently to enable them to get 'round at all; and on the upper turn it was necessary to come almost to a full stop in order to keep from going into the ditch on the outside. Here a combination of skill and nerve was a requisite, and it was at this point that Bernin overmastered Vanderbilt and won the day by going around in grand style; although it is only justice to the young millionaire to mention that at the foot of the hill, in his 1.20 3-5 trial, he had to slacken to avoid running into a man in the road. Had it not been for this the result might have been reversed, in spite of Bernin's superiority on the turn.

The day broke with mist and fog obscuring the sun, but notwithstanding the Weather Bureau's prognostication of rain everything pointed to a dispersal of the clouds and a triumph of Old Sol. Thus it turned out, and by 11 o'clock a glorious Indian summer day was in full flood, in place of the crisp, frosty, blood tingling, typically November day that many had looked to succeed the morning's mist. In part the ideal day was responsible for the enormous outpouring of spectators.

Almost dwarfed as the automobile contingent was by the mass of pedestrians, it was still a large and notable one. It was among the early arrivals. Only a few came after 11 o'clock, and these were mostly from New York and other comparatively distant points. To the casual observer the number of cars did not seem large; not as large, for example, as the gatherings at the Empire City track on race days, nor as large as the number of motorists at the foot of the hill and scattered along the course indicated. This was due chiefly to the fact that there was no general "parking" point. The cars were all driven to the foot of the hill, where most of them discharged their passengers, and then the question of disposal came up. Soon there was a congestion of cars at the starting point, and it became difficult for arriving ones to push through them. The hill itself was kept commendably clear of cars, so there was no relief there. The only thing left was to drive the cars to the edges of the crowd, and this pushed the newcomers further away from the foot of the hill, so that many cars were entirely out of sight, occupying all the roads within a radius of a quarter of a mile.

The cars were of all types. There were big touring cars, foreign and domestic, loaded to their full capacity with motorists in ultra costumes, and little runabouts, with here and there a relic of the dark ages in the shape of a "dinky" steamer that seemed as if it had been resuscitated for the day only. But the palm for numbers was borne by the tonneau car of moderate size and power, carrying four persons. It was seen everywhere, manoeuvering for a choice position or being driven to the outskirts of the crowd.

The arrangements for handling the crowd were simple and perfect as far as they went. No one expected such an outpouring of people, consequently no atempt was made to cope with it; and, short of an army of police,



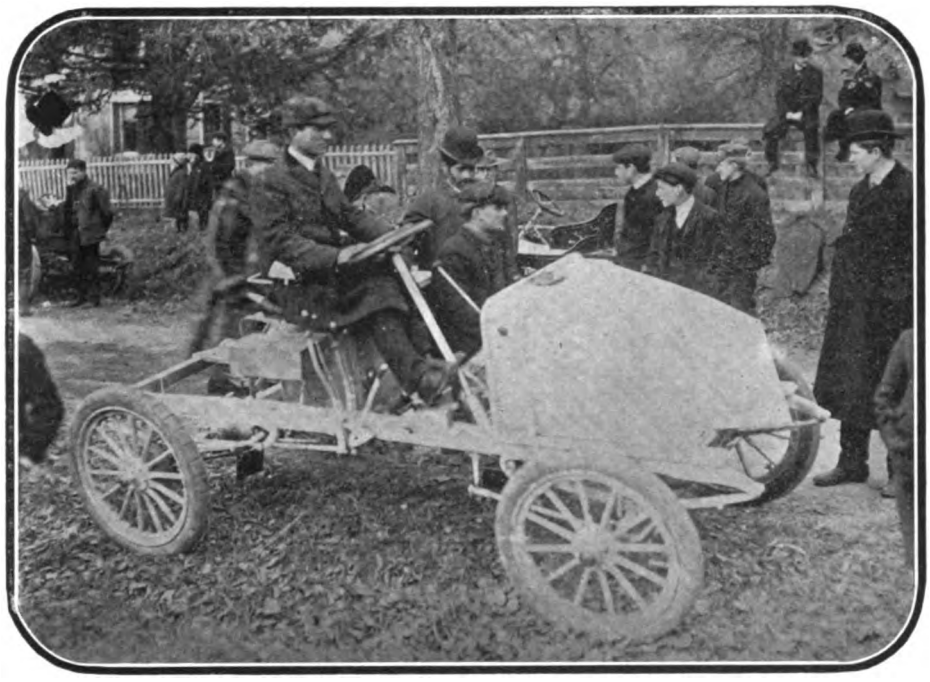
Digitized by Google

none could have been made. There were perhaps a dozen of the West Orange police, most of them at the foot of the hill; outside of these, there was a corps of hard working officials at the start and finish and distributed along the course. Most useful of these was the gallant band of megaphoners and signalmen. The starting of a car was announced by them, and the vocal and visual tokens passed along from bottom to top of hill; the men were in sight of and in touch with each other and no car reached any point unheralded. The celerity with which the crowd scattered and sought vantage points at the sides of the road was remarkable, although many of them waited until they saw the car actually approaching before moving. To this quickness was due the entire absence of casualties, one dog alone excepted, which was sent to canine heaven with astonishing quickness.

The course was, as stated, in the worst condition since the contests were begun in 1901. The straight stretches were fairly good, but the two turns were bad to begin with and became much worse before the day was over. The speeding cars hugged the inside of the road closely and wore the roadbed into ruts and loosened the stones and scattered them in reckless fashion clear across the road, until the latter looked as if a train of traction engines had passed over it.

This was the more surprising, in view of the fact that elaborate repairs had been undertaken for a week or more before the day of the contest. The West Orange authorities had taken charge of the matter, and the Automobile Club of New Jersey was to foot the bill. When a couple of days before a bill for $247 for road repairs and $51 for policing the course was presented, things looked stormy for a few minutes. The authorities "stood pat," however, stating that it was "no money, no race," and the amount was finally paid over. Coupled with the bill was a demand for a $5,000 indemnity bond, accompanied by the same ultimatum. For a while this seemed a poser, but a bond from a surety company, indemnifying the town against damage caused by the participants in the race, was finally presented by the club, and after a long wrangle it was accepted.

The smashing of records began when the first car, an electric, was sent off at about 9:15, and the slaughter did not end until the contest was brought to a close more than four hours later. That the electric record of the year previous would go was considered likely, and so it proved. It was cut by more than two minutes—from 6:38¼ to 4:22 3-5. The steam car record of 2:42, standing since 1902, then came in for a buffeting, both at the hands of Webb Jay, in a stock 15 horsepower White car stripped for racing, and, earlier in the day, by E. J. Foley, in a 7½ horsepower Prescott. The latter's time was 1:52 2-5, while Jay elicited applause along the line by gliding up the hill swiftly and without a sound in 1:28 2-5. Later, in the heavy car class, Jay bettered this performance, covering the course in 1:22 3-5, the fifth best time of the day and ahead of 60 and 70 horsepower cars in the same class. It was the general impression that Jay was driving a special racing car, so swift was its flight up the hill, but such was not the case. It was a 1905 stock model, as far as the engine, generator, running gear, etc., are concerned.



VANDERBILT SLEWING AROUND THE LAST TURN.
THE SHARP TURN HALF WAY UP.
THE OFFICIAL STAND.

In the class for cars between $850 and

$1,250, the new Buick car, driven by H. J. Koehler, the Newark (N. J.) dealer, made its initial appearance, and in a twinkling stamped itself a wonder. It carried off first honors in its class by a wide margin, cutting

WEBB JAY IN THE WONDERFUL WHITE.

started forward, then disappeared over the brow of the hill. In quick succession the Fiats of Frank Croker and of E. Cedrino made the ascent, and then a chorus of cheers announced the coming of W. K. Vanderbilt,

THE OBSERVED OF ALL OBSERVERS.

the record from 4:13½ to 2:18 2-5. The clean-cut and businesslike appearance of the car and its quiet running caused much favorable comment. The new 40 horsepower Thomas, driven by M. H. Roberts, showed that its work at Waverley on the preceding Saturday was no fluke by cutting the record in the $2,000 to $3,000 class from 3:46 to 2:42.

In view of the large number of entries—fifty-one in all—the start of the contest was set for 8:30 a. m. It was nearly three-quarters of an hour later when the McMurtry electric timing apparatus, which worked perfectly throughout the day, recorded the getting away of the first car. Beginning with the electrics, steamers and small gasolene cars, and following the plan of last year by dividing the competitors into classes according to motive power and price, a good start was made, and by 10:30 the ground was cleared for the departure of the cars in Class 8—those listing at more than $5,000. Good and fast work as had been done by the previous competitors, it was the big cars that the crowd had been waiting for, and when Sartori, in A. G. Vanderbilt's 90 horsepower Fiat, dashed up the hill at a tremendous pace the first pronounced enthusiasm was shown. He got around the first turn in good shape, but nearly came to grief on the still sharper one near the top of the hill. Steering close to the inner side of the road, he withdrew his clutch and brought his front wheels around. They acted as a pivot, while the rear ones slewed around at a tremendous rate and brought the car almost straight across the road. Just at the right moment Sartori engaged his clutch and

H. J. KOEHLER IN THE NEW BUICK CAR THAT MADE A SENSATIONAL "DEBUT."

jr. He took the bad turn wide, only to repeat Sartori's performance, the rear wheels of his car slewing into the ditch and bringing up at a hedge at the side of the road. William Wallace, of Boston, came next, and at this point rolled his right front tire off; but as through an error his time was not taken he was given another trial. This proved fortunate for him, for in his second run he beat Sartori's time, 1:24 1-5, which was up to then the fastest, by two-fifths of a second, his time being 1:23 4-5. Vanderbilt's time was 1:26 3-5. Bernin did not compete in this class.

All the big cars were billed for a second appearance in the heavy car class. All the drivers had become better acquainted with the course, and were thereby enabled to bet-

Digitized by Google

ter their times materially. As the White steamer, although barred from the "over $5,000" class owing to its list of $2,500, was eligible to the heavy car class, it competed and succeeded in surpassing all the times made in the "over $5,000" class; and it was beaten only by four racing cars costing six or eight times as much.

Before the heavy class could be run off, however, it became necessary to wait until a comparatively clear road could be obtained. It was almost 12 o'clock, and the crowd seemed to be reminded of its Thanksgiving dinner at one and the same moment. Thereupon a hegira began that swept the officials off their feet and stopped the contest for nearly three-quarters of an hour. From foot to summit the hill was one mass of slowly moving humanity, through which no car could have made its way. It was only when about three-quarters of the spectators had left the hill that the contest was resumed.

Although Bernin had not yet competed, he made the cleanest and most expeditious ascent of the day, going at marvellous speed and taking the turns with rare skill, his run being clocked at 1:20 flat. W. K. Vanderbilt, jr., could only do 1:20 3-5, while Wallace bettered his own time to the extent of 1 4-5 seconds. Sartori came next, only one-fifth of a second behind Wallace, and was hard pressed by Webb Jay, two-fifths of a second later.

In the 1903 contest there were thirty-six entrants, and premier honors went to W. K. Vanderbilt, jr. It is interesting to recall that on that occasion he drove a 30 horsepower racing Mors, and his time was 1:36¾. This year his car was a 90 horsepower Mercedes, and his best time was 1:20 3-5.

Although no motorcycle events were scheduled, three time trials were made with two wheeled machines, all of them being officially timed by the McMurtry electric device. The first trial was made by P. H. Johnson, of Newark, N. J., who ascended the hill on an Indian motor-bicycle in 1:59 4-5. Oscar Hedstrom, Springfield, Mass., made two trials with a double cylinder Indian. He fell the first time, and the second covered the course in 1:41.

The summaries:

EVENT NO. 1—ELECTRIC VEHICLES, STOCK MACHINES.

Driver.	Car.	Time. M. S.

W. F. Winchester	12 h. p. Franklin	2:26
F. F. Cameron	10 h. p. Cameron	3:07 1-5

At the close of the contest Harlan W. Whipple, president of the American Automobile Association, tendered his customary dinner to nearly one hundred guests at the Orange Club. As usual on these festive occasions, mirth and jollity abounded, those present giving themselves up to an abandonment of good humor. Lively sallies of wit were exchanged after the viands had been discussed and the speechmaking begun, and were productive of keen enjoyment.

A notable guest was Inspector Smith of the New York Police Department, who, when called on for a speech, gave an address that for soundness and sensibleness could not be surpassed. He declared that the police officials were not opposed to automobiles, and that if it were not for the reckless and inconsiderate minority of motorists there would be no trouble and no friction.

To J. A. Hill fell the task of making the presentation speech on behalf of friends of Winthrop E. Scarritt, who had given him a new 1905 White steam car, which he had given its initial run that day. He declared with a perfectly straight face that, to his knowledge, Mr. Scarritt had owned nineteen automobiles and had never ridden nineteen consecutive miles on any one of them; that he did not know how to make the smallest repair to a car, but that he was now taking lessons at the Y. M. C. A. school in this city in the hope of qualifying himself. William Wallace made himself very popular by singing a many versed ballad entitled "How Would You Like To Go Halves on That?" the verse on Lydia Pinkham being the hit of the song.

Houston Has a Rousing Meet.

What was said to be the greatest number of spectators ever inside the gates witnessed the races at the driving park in Houston, Tex., on November 23. Colonel E. H. R. Green, of Dallas, went to the meet with three machines in a special car, and took away with him two silver cups for winning two of the events. The race for cars of 20 horsepower and over was the most exciting contest of the day, Colonel Green's Pope-Toledo defeating Howard Hughes, in a Peerless, and Percy Pierce, in a Pierce Great Arrow. Summaries:

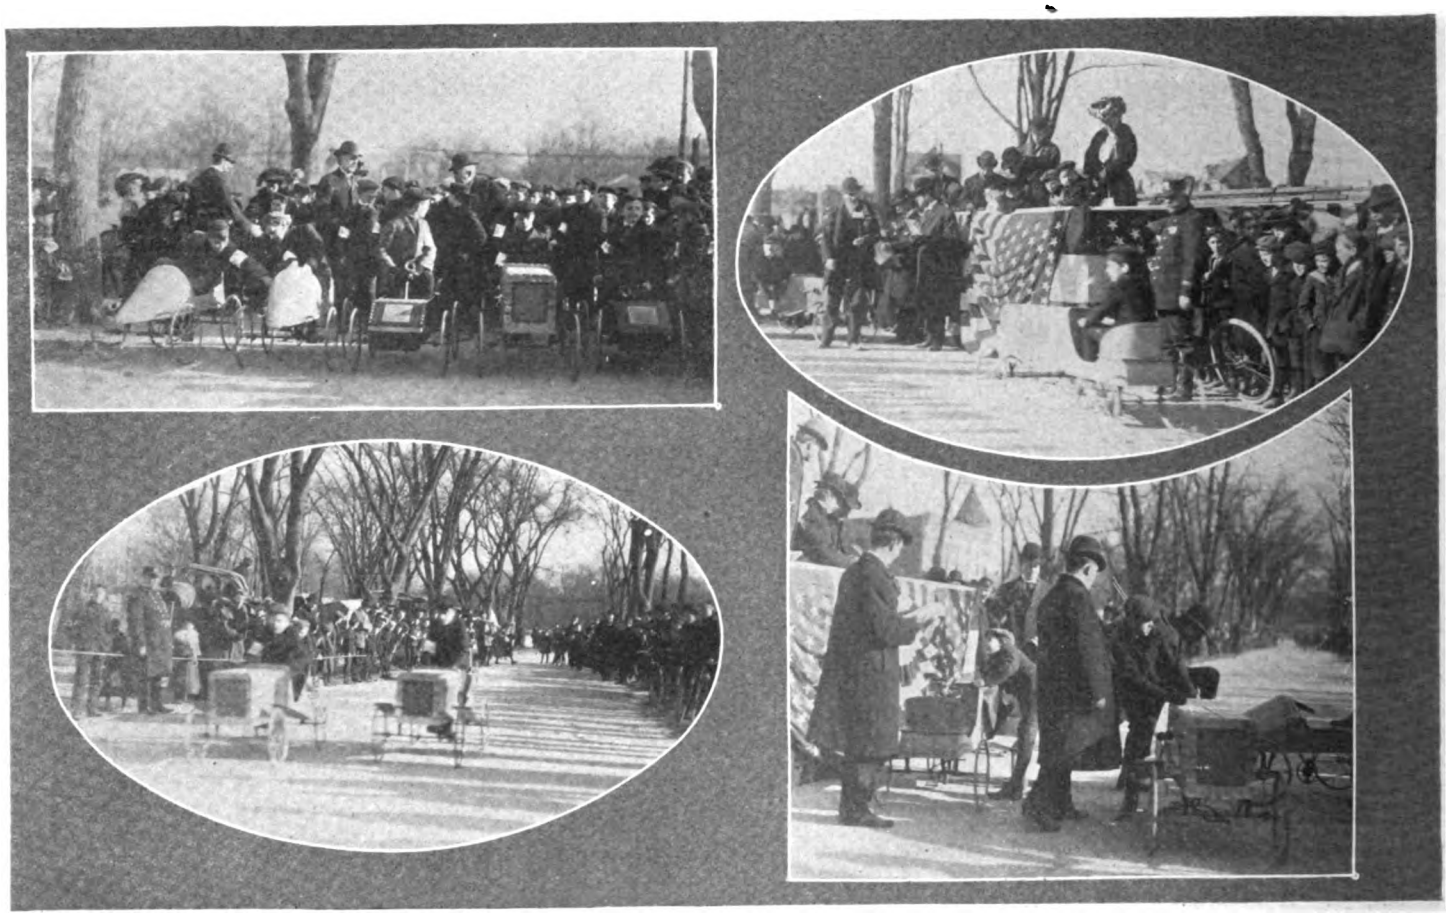
Three miles, for local cars of 8 horsepower and under—Won by W. A. Burkett (Oldsmobile); C. Bender, jr. (Oldsmobile), second; James Bering (Cadillac), third. Time, 5:23.

Three-mile novelty race—Won by Dr. J. R. Stuart (Winton); Dr. W. R. Eckhardt, second. Time, 13:45.

Two miles, for motor bicycles—Won by Lewis Birdsong (Orient); J. Wade Cox (Thomas Auto-Bi), second. Time, 4:34¾.

Three miles, for cars having less than four cylinders and not more than 10 horsepower—Won by G. W. Hawkins (Oldsmobile); Seymour Hanford (Oldsmobile), second; S. E. Bering (Cadillac), third. Time, 5:49.

Five miles, for cars of 20 horsepower and under—Won by E. H. R. Green (Franklin); S. H. Boren (Franklin), second; Dr. J. R. Stuart (Winton), third. Time, 8:14 1-5.



Five miles, for cars of 20 horsepower and over—Won by E. H. R. Green (Pope-Toledo); Howard Hughes (Peerless), second; Percy Pierce (Pierce Great Arrow), third. Time, 7:32 2-5.

Slow Going at Baltimore.

The races at Electric Park, Baltimore, on Thanksgiving Day, were witnessed by about two thousand spectators, but were spoiled by the condition of the track. A snowstorm two weeks previous had caused the supports of the electric lights to break, and pieces of the light globes were scattered all around the track. The most interesting event of the afternoon was the three-mile contest for touring cars, which was won by Thomas Goodwin, in a 40 horsepower Thomas. He got a poor start, but overtook Stanley Zell's 20 horsepower Winton in the last half mile and won in 6:08. The heat race, at two miles, for machines costing less than $1,000, was won by Graham Hall in straight heats. Edmund Buchanan was second in both heats, being the only other starter in the second heat. Hall's time in the first heat was 4:20; in the second heat, 4:21. H. J. Painter, of California, won the unlimited Australian pursuit race for motorcyclists in 7:34, the distance covered being four and one-third miles. His only opponent was Ray Thomas, of Baltimore.

Brooklyn's One-Boy Power Automobile Race.

"Soap Box" Beats "Grey Devils" and Others.

Saturday last was a great day for the small boy of Brooklyn, N. Y. Some two hundred of him "motored," as few of them ever had "motored" before, that is, in toy "automobiles," the kind propelled by pedals and fitted with miniature "automobile bodies." The race was inspired by a similar event in Paris and was promoted by a Brooklyn department store. The contest was run on the Coney Island cycle path and attracted an interested and interesting crowd.

As toy "automobiles," in value $50, $22 and $12 were provided by the promoters as prizes, and as they charged no entrance fee and also supplied the necessary "cars," things were easy for the youngsters, who flocked to the scene in great numbers; every mother's son of them was accompanied by his mother and brothers and sisters and all the other brothers and sisters of his particular neighborhood.

The race was run in heats of five each, the final of which will be run on Saturday next. There were thirty-nine of the trial heats run and, sad to tell,. none of the highly ornamental "Grey Devils" and "Roaring Lions" turned out by proud manufacturers, won the premier honors. Instead, ingenious little "Johnnie" McKenna, whose "car" was constructed of a soapbox and the wheels and other parts of an old bicycle, ran away from all the rest of the struggling contenders. Whether or no he will be able to "make good" on Saturday next remains to be seen. McKenna pedalled over the one hundred yards in twenty-five seconds. His nearest competitor was 12-5 seconds behind him.

St. Louis Tackles Chauffeur Problem.

The St. Louis Automobile Club has attacked the chauffeur problem and settled it to its own satisfaction, at least.

At a recent meeting of the board of directors it was decided to issue chauffeur certificates. These will be granted to the different drivers of the city after a thorough examination by a board appointed for that purpose by the club. A technical knowledge of the machine will be required, as well as other qualifications, such as character, physical requirements and other general conditions. These certificates are authentic only so far as the local club is concerned, and will be the driver's recommendation to any member of the club. The certificate reads as follows:

"This is to certify that John Smith has been examined by a committee of the club, and that he is duly qualified to act as an operator. His personal habits and character are good."

The certificate will be signed by the president of the club and the committee.

Why He Refused a Second Ride.

While an appetite for speed may be worked up gradually, and often is, a too large dose of speed during a first ride in an automobile is frequently the means of arousing a prejudice against motor driven vehicles which is hard to overcome. An instance of this was encountered recently when a man who is much given to hunting and shooting was heard to say that he did not like automobiles. He did not appear to be a very timid sort of a person either, as he is more than six feet tall and weighs more than 200 pounds.

"One experience in an automobile was enough for me," he said, when asked why he disliked automobiles. "A lot of us were out in New Jersey recently shooting at clay pigeons, and when it came time for the party to go home a physician volunteered to take me to the train in his automobile. I had never been in one and so accepted the offer. We had about five miles to go from the gun club grounds to his house, from which it was only a short distance to the railroad station. He drove that machine to his house as if he had been sent for. We grazed a dozen or more farmers' wagons and I thought the machine would be wrecked long before we reached the physician's house. It seemed to me as if he were driving it just as fast as he possibly could, and I hung onto the seat, expecting to be thrown on my head every minute. We had lunch at the physician's house and after we had finished he told me to get ready and he would drive me to the station, but I thanked him and told him that I would much rather walk, which I did. I do not want any more automobile rides in mine."

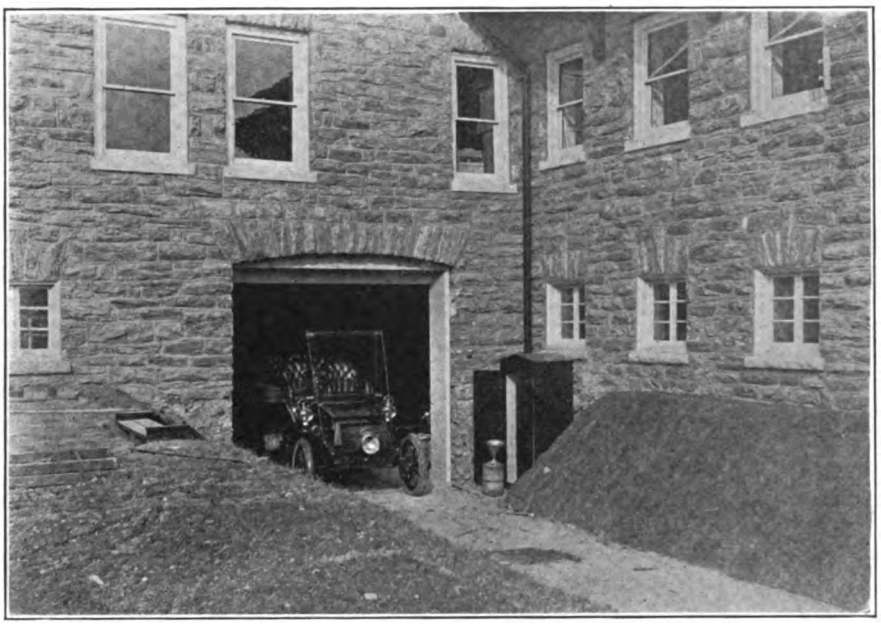
America's First Specially Designed Automobile Club House.

NEW BUILDING OF THE GERMANTOWN AUTOMOBILE CLUB.

The Automobile Club of Germantown, historic suburb of Philadelphia, enjoys the distinction of having the first house of any club in this country which was designed and built exclusively for the purpose. The clubhouse, which was officially "warmed" last week, is situated at Carpenter Station on the Pennsylvania Railroad, in a commanding position overlooking the country for miles around, and located so closely to the line of a railroad leading into the centre of the city, it has all the advantages of a central position in the city while also enjoying the prodigality of space which could be only secured in the country or suburbs. The structure is a low, rambling one, the main portion of which is 45 by 65 feet, with an annex 20 by 35, which is designed for the accommodation of the caretakers of the house. The building is two stories in height and has a sloping roof with great, overhanging eaves, which give it a very characteristic and inviting appearance, which is enhanced by the wide porch extending the breadth of the house; the pillars employed are of very massive proportions.

One of the places of prime interest is the garage, which is, of course, located in the basement with an entrance at the side of the building. This is the only entrance to this part of the building, there being no connection with the other part of the house through the interior. This provision is to prevent the odors and noises of the garage from finding their way to the rooms devoted to social purposes. Here there are accommodations for twenty cars, and the entire capacity of the place has been taken by the members already, although it was not expected that the place would be filled for some time yet. Already there is some talk of enlarging the garage and further increasing the accommodations by opening another doorway at the opposite end so that any of the cars may be run out or in without disturbing any of the others. There are closets for each of the members, storage for lubricating oil, machine shop, washing stand and repair pit.



FIRE PLACE IN FOYER.

Two excellent precautions are taken with a view of reducing to a minimum the danger of fire. The gasolene tank is buried in the ground at a distance of forty feet from the house, although the fuel is delivered right at the garage entrance by means of a pump. Another feature of safety is that there is no fire at any time in the house. The building is heated by steam, which is generated outside and carried underground by means of pipes. A special ventilating system has been devised for the garage, by means of which all the fumes are carried off through the chimney, the air being kept in motion by electric fans.

As one enters the main doorway he finds

Digitized by Google

himself in a great hall or foyer, which is used for a ball room on social occasions and at other times, by the erection of screens, it is made to answer the purposes of reading and lounging rooms. This hall runs through the centre of the house to the roof with a Moorish arrangement of arches extending around on both the first and second floors. The woodwork is of a deep brown color, and the other furnishings are of dark red,

GARAGE ENTRANCE, GERMANTOWN AUTOMOBILE CLUB.

and the effect of this combination is very rich. On the first floor there are a number of small rooms designed for the use of the ladies of the members' families, who will always be made welcome, although there is no provision for women membership of any character. On the second floor there are bachelor's quarters for four men, a billiard room and rooms for other purposes, such as card parties and small dinner parties.

The club has inaugurated a scheme of disposing of supplies to the members which will result in profit to them as well as the organization. Tires of all kinds, gasolene, lubrication oil, and all similar articles which are constantly demanded, will be kept on hand at all times, and, through the influence of the members, arrangements have been made to secure the most desirable kinds at the lowest figure. These will be sold to the members at a price which will make it worth while for them to patronize the club and at the same time will result in profit to the organization.

The membership of the club is limited to one hundred, and there has been a waiting list since a few weeks after the scheme for building the house took substantial form.

The officers are: President, Prescott Adamson; vice-president, H. W. Butterworth; secretary and treasurer, Robert P. Hooper.

A Toronto (Canada) motorist has been convicted and fined for selling his car and keeping the license and number for the new one.

Farson's Injunction Covers All.

Confusion worse confounded about hits off the Chicago automobile situation just now. The city and park officials are wondering where they are "at," while John Farson and his rapidly growing band of admiring supporters are "standing pat" and asking the aforementioned officials what they are going to do about it.

The Farson injunctions still hold. Furthermore, Judge Hanecy has declared that they are binding against the park boards or whoever else attempts to ignore them; and as any motorist can obtain the protection of the injunction by merely asking to be made a part of it—a batch of two hundred and fifty did this at one lick last week—it will not be long before there will be no one without the pale.

One park board, that for the West Park, passed a rule requiring horns to be sounded; another, the North Side, forbid "tooting." Other conflicting rules were passed, until Judge Hanecy was appealed to, and he declared that the original injunction given the motorists would protect them against any and all ordinances that have been or may be passed by the park boards.

Glidden Cup will be Handsome.

The design for the $2,000 cup which is to be known as the Glidden Trophy has been completed. The cup will be a sterling silver globe, representing the world, supported on a pedestal of two caryatides back to back, conveying the idea of the eastern and western hemispheres. The style is classical renaissance, treating the figures of victory in conventional form, laurel wreaths pending from the shoulders, flexible for use as handles. The wings support the globe turning on axis, which will be etched and enamelled to distinguish the water from the land, with the principal countries disposed about the sphere. The height, including that of a small model automobile at the apex containing a sprig of laurel, will be 46 inches. Four hundred ounces of silver will be used in the construction.

TIE AT PROVIDENCE

Hill Climbing Contest Provides Excitement and a Protest Creating Odd Situation.

Sixteen cars competed in the annual hill-climb of the Rhode Island Automobile Club at Providence on November 26. All of last year's records in each class were lowered. The hill is one-third of a mile in length, with an average grade of 14 per cent. There are two sharp turns, one directly at the bottom and the other about a third of the way up, where the road has a turn of nearly 90 degrees. The hill rises steadily for about half the distance, when a 23 per cent grade is encountered, which reaches almost to the top. Electric wires had been strung, and the timers were to have been notified of the start of each car by the ringing of a bell, but the wires would not work, and flags were used to signal the start of each car.

The grand prize for the best time was awarded to B. F. Blackinton, whose time was 47 4-5 seconds. The prize was a silver cup donated by C. Prescott Knight, and must be won three times by the same man before it becomes his property. Blackinton's time was bettered by J. L. Snow, who made the climb in 46 seconds in the run-off of his tie with A. E. Adams in the heavy gasolene class. Harry Martin, owner of the car that Snow drove, protested against the award to Blackinton, but the committee ruled that only the times made in the regular events counted. The club offered silver cups for first and second prizes in all events where there were three or more starters.

Arthur Feltham won in the electric class, with Archie Hughes's Waverly in 1:11 4-5, which is less than half the time of the winner in the same class last year, when H. H. Rice won in 2:56. R. L. Lippit, who drove the defeated car in the electric class, had the satisfaction of winning in the class for gasolene machines costing $1,500 and less. J. L. Snow, in Harry Martin's Peerless and A. E. Adams in the Pope-Toledo owned by W. K. Foss, former manager of the Pope store, in Providence, and now at Boston, tied at 48 seconds in their first attempts. In the run-off, Adams was one-fifth of a second slower than his first try, but Snow bettered his time by two seconds.

Summaries

Electric—
Archie Hughes (Arthur Feltham), Waverley, time 1:11 4-5; R. L. Lippitt (owner), Waverley, time 1:43.

Steam—
B. F. Blackinton (owner), Stanley, time 0:47 4-5; L. T. N. Baldwin (owner), Stanley, time 0:52; Lowell Emerson (owner), Stanley, time 1:17.

Gasolene cars costing $1,500 and less—
R. L. Lippitt (owner), Franklin, time 1:29; N. S. Davis (J. Risley), Columbia, time 1:32; Archie Hughes (Jeff Crawford), Pope-Hartford, time 1:35; Ezra Perkins (owner), Stevens-Duryea, time 1:41; W. W. Whitten (owner), Rambler, time 1:49 1-2.

Gasolene cars costing over $1,500—
*W. K. Foss (A. E. Adams), Pope-Toledo, time 0:48; *Harry Martin (J. L. Snow), Peerless, time 0:48; Archie Hughes (owner), Pope-Toledo, time 0:56; John Shepard (A. Sexton), G. R. B., time 1:10; Darwin Almy (owner), Winton, time 1:11; Arthur Lee (owner), Pope-Toledo, time 1:16.

*Tie. In the run-off, Snow's time was 46 seconds, Adams's 48 1-5 seconds.

BEVEL GEAR VS. CHAIN

Comparison of the Two Systems of Transmission Makes Honors Appear Easy.

The consideration of the merits of the bevel gear drive for automobiles as compared with the chain is naturally before the purchaser when he thinks of buying.

The two types or principles still exist side by side in the bicycle trade, and, probably, always will. One purchaser is best suited by a chain for his particular kind of use for a bicycle; another is best suited by the bevel gear, all things considered.

It is probable that this will be the final outcome in the automobile industry as well. There is no apparent reason why the two systems should not exist, why each should not fill the wants of a certain number of purchasers. One manufacturer or purchaser may be the strongest kind of an advocate of the bevel gear and another of the chain.

The efficiency of the two systems was very carefully gone into, as connected with bicycles. It was positively determined by the experiments of Denton, Souther, Carpenter and others that the difference in efficiency was so small, as compared with other losses of power in the bicycle, that it might be entirely neglected.

For example, the difference between a racing tire and a road tire was easily shown to be from 5 to 15 per cent loss of power. The difference between chains and gears, all other things being equal, it was impossible to measure. The amount of wind pressure in the tires could be easily measured, and made a difference of 4 or 5 per cent.

Consequently, it is fair to say that the loss of power of the one system more than the other may be disregarded.

Looking at the construction in each case, it is seen that the engine power is transmitted by a shaft, alike in both systems, through clutch and transmission gears. With a chain driven machine there comes next a pair of bevel gears driving the countershaft, which carries one or two small sprockets, depending upon whether single or double chain drive.

The chains then transmit the power from the small sprockets to large sprockets directly connected with the rear wheels, running loose and independently on the rear axles.

In the case of the bevel gear, the shaft, after leaving the transmission case, is carried directly to the rear axle, and has on its end a bevel gear pinion meshing with a bevel gear driving a shaft directly attached to and rotating the rear wheels.

It is to be noticed, therefore, that both systems transmit through a set of bevel gears, the arrangement being quite different, however.

As to strength of construction: The rear axle of a chain driven machine is exceedingly simple in its construction; it is exactly like that of any wagon, except that sprockets are attached to the hubs, to be driven by chains.

The rear axle of a bevel gear driven machine is considerably more complicated. It has the bevel gears at its center, thus dividing it; an outer tubular axle through which the driving axle runs, in which are supported bearings for the interior moving axle. Properly constructed, with a sufficient knowledge of the strains involved, and in consideration of the power transmitted, little trouble has been experienced, and the machines made by reliable makers have given good satisfaction.

In short, the complications of construction are all centered on the rear axle of the bevel gear driven machine, and are not distributed between the rear axle and the countershaft, as on a chain driven machine.

The care of a chain driven machine, as to lubrication and wear, is distributed between the countershaft, the chains and the rear sprocket.

The care of a bevel gear driven machine is all confined to the rear axle, which must be thoroughly lubricated by the best of oils.

Both systems of transmission have been in use in the mechanical world as far back as records go. Immense improvements are being made in both the manufacture of chains, sprockets and bevel gears. The nicety of manufacture, relative cutting of chain and sprockets, and fine meshing of bevel gears has become an art, a specialty in machine building. Some makers have found that relation between pitch of chain and sprocket which gives noiseless transmission; others have not. Some makers have put out bevel gears which are positively noiseless and cannot be felt; others have not.

The purchaser is free to buy without being greatly influenced by the form of transmission, being reasonably sure that the best of either kind will give him good satisfaction.

It will be seen at once that the above remarks do not apply to any automobile the crank shaft of which is parallel with the rear axle. It does apply to all machines with crank shafts perpendicular to the rear axle.

Care of the Clutch.

The proper care of a leather faced clutch is essential to the smooth running of a car. A clutch that is too dry is fierce, and causes an unpleasant jerk and strain upon the car when starting or changing gear, while if the clutch is allowed to become saturated with lubricating oil or water the consequent slip is most annoying to the driver, besides being bad for engine and transmission gear. The leather should be well cleaned with gasolene occasionally, and then dressed with castor or, better still, collan oil. This will keep it supple enough to take good hold of the metal of the coned flywheel, and yet in such condition that the clutch can be allowed to slip without undue jerking when it is desired to coax the car over the brow of a hill without changing speed.

USING THE WASTE GASES

How an Ingenious Frenchman Employs Them for Ignition or Illuminating Purposes.

It is customary to style the gases which issue from the exhaust as "waste" gases; but in time this description will be quite erroneous. Already some portion of the exhaust is used for heating the carburetter, for supplying pressure in the various tanks, or for pumping tires.

It has remained for M. Bleriot, a French engineer, to devise an ingenious scheme for utilizing the heat of the exhaust gases in yet another manner. He takes advantage of the method by which thermo-electricity is produced, namely, the coupling together of two metals, such as nickel and copper, and obtaining an electric current which depends on the difference in temperature of the points of contact, when one end of both metals is heated and the other cooled.

Around the exhaust pipe are a series of copper tubes insulated from the metal of the exhaust pipe itself. Into the copper tubes nickel threads are run, so that each pair forms a little thermo-electric battery. They are all coupled up in series, and are so arranged that, while the inner ends are heated by the exhaust gases coming through the pipe, the outer ends are cooled by contact with the air. The current is collected at two terminals, and may be utilized, the inventor claims, for the headlights or for ignition purposes.

Chicago Tries a Street Sweeper.

Superintendent Fox, of the citizens' street cleaning bureau of Chicago, has introduced automobile street sweepers in that city and is enthusiastic over their work. This machine not only sweeps the street over which it runs, but by an elevator system collects the dirt into a box on top. It is also equipped with a water tank, which sprinkles the street and prevents the spread of dust. The new machine is entirely automatic and requires but one attendant. It is claimed the new method is much cheaper than the old, which required carts and attendants who collected and carried away the dirt swept up. Other cities will probably inaugurate automobile street sweepers if they prove successful after a thorough trial has been given them.

St. Louis Experiments with Sprinklers.

The street department officers in St. Louis are busy experimenting with automobile sprinklers to determine whether there is greater economy in operating the sprinklers with motor power or to continue drawing the water wagons the old-fashioned way, with mule power. The first test was made last week, and was for the purpose of ascertaining how much power will be needed for the propulsion of the water wagons. A 24 horsepower automobile was hitched to the city's largest sprinkler and pulled it easily. Automobiles of less power will now be tried.

The Gold Medal to Solar Lamps

Award by the jury at the Universal Exposition at St. Louis

Confirms our repeated claims that Solar Lamps are THE BEST acetylene and oil automobile, motor car and cycle lamps manufactured in this or any other country. This award was made after a careful examination by the leading experts of the world of all lines of lamps. We are justly proud of the showing made by Solar Lamps and are more convinced than ever that our policy of honest manufacture, use of best materials, and highest skilled labor, pays.

OUR 1905 LINE OF SOLARS NOW READY AND ARE BETTER THAN EVER.

To the manufacturers of automobiles we desire to say that Solar Lamps as an equipment add greatly to the appearance and selling qualities of any automobile.

To the drivers of automobiles we wish to enlarge upon the fact that Solar Lamps and our 1905 Generator mean NO LAMP TROUBLES.

We shall continue our policy of absolutely guaranteeing perfect satisfaction. Let us know when you are ready for 1905 samples and prices.

MEASURING POWER

Renard's Ingenious Device, How It Performs Its Work and What It Discloses.

It is pretty well known that the Automobile Club of France has been in the habit from time to time of conducting exhaustive tests of important parts of the automobile, it having installed in its laboratory some very elaborate devices. A test of carburetters was made last summer with marked success.

Recently another department has been added to the laboratory for ascertaining the power developed by motors and absorbed by transmissions with the aid of the dynamometric mill invented by Colonel Renard, whose name is well known as the inventor of the military balloon "France" a quarter of a century ago, the Renard road train and a variety of other devices associated with automobilism.

Colonel Renard first presented the dynamometric mill—the apparatus is much simpler than is suggested by the name—at a congress held in Paris two years ago. It is based upon an entirely new principle of utilizing air resistance as a means of measuring the power developed. The apparatus employed for this purpose is an arm of rectangular section of elm, or other suitable wood, revolving on the end of a shaft to which it is fixed. Through this arm is bored a number of holes in which two square aluminum plates are bolted, one at each end. As the mill revolves the resistance offered by the plates varies according to their area and to the distance separating them—that is to say, as the plates are placed closer together the resistance diminishes and attains its maximum when they are at the extreme ends. The area of the plates is calculated for mills suitable for testing motors within certain limits of power.

Colonel Renard had necessarily to carry out a very long and exhaustive series of experiments before he could ascertain the exact resistance offered by the area of the plates, their position and speed of mill, and incidentally it may be remarked that in experimenting with various forms of plates he obtained some extremely interesting data, a spherical ball offering about forty times less resistance than a flat plate of the same sectional area. This experiment fully bore out the practical results obtained by makers in building their high speed racing cars with bodies offering curved lines to the air resistance.

It is evident that having obtained a scale of resistance at various speeds and positions of the plates, this very simple apparatus can be employed to accurately measure the power of the engine to which it is attached.

The engine to be tested is bolted to a wooden bed, which is in its turn solidly fastened to girders built into the masonry. By the side of the motor is a heavy wooden frame bolted to the ground. To this is fixed a horizontal tube in which revolves part of the universal jointed shaft, to one end of which is keyed the mill. The other end of the shaft is keyed to the crank shaft. In testing the motor it is, of course, necessary to know exactly at what speed the mill is revolving, so that by referring to the scale the resistance offered at this speed can be ascertained.

Besides the usual mechanical indicators showing the number of revolutions in a given time, the installation is fitted with the new Teletachymetre constructed by Messrs. Chauvin & Arnaux. This consists of a small magneto fixed to the frame and driven by a rubber band from a wheel on the universal jointed shaft. The variations are indicated by a needle on a gauge and corresponding to the number of revolutions marked on the dial. A number of mills of different lengths, and with plates of different sizes, are employed for measuring the power developed by engines ranging from little bicycle motors up to motors of 100 horsepower.

It will easily be seen that if motors can be measured in this way there is no reason why a measurement should not be taken of the power developed on the driving axle, so that it is possible to ascertain with the greatest accuracy the amount of power absorbed by friction between the engine and the driving axle. For this purpose an installation has been fitted up, consisting of a bed of masonry of a suitable height, with an incline up which the car is drawn by winding gear. The front of the car is fixed by ropes and the rear part is raised on wooden supports bolted to wedges inside the grooves formed by the girders built in the masonry bed. On each side of the bed is a stand carrying a mill, one of them capable of being moved longitudinally so as to adjust it to the width of the car. The mill is the same as has already been described, but the end of the universal jointed shaft carries a metal cone which is fixed to the spokes by means of bolts and cross pieces. The power developed on the axle is then measured in the way already indicated, and the difference between this power and that developed by the motor gives the exact amount of frictional loss in transmission.

The Renard apparatus is extremely useful as a ready and accurate means of measuring the power of engines, and it is providing a lot of valuable data which will throw an interesting light upon the efficiency of the various forms of power transmitting gears.

Taking Time by the Forelock.

Impelled by the belief that the doom of the horse, so far as city streets is concerned, is impending, a well known painter of Parisian life, M. Louis Vallet, proposes the organization of a permanent museum of vehicles, including in the collection those used to-day not only in Paris but in all parts of the world. Several great savants and collectors are supporting him in his scheme, and it is hoped that the State will provide a building and money for carrying the suggestion into effect. An exhibition of vehicles of the eighteenth and nineteenth centuries, which already exists at Versailles, might form the nucleus of the projected museum.

COOLING THE MOTOR

Frenchman Discusses the Subject and Concludes that Problem has not been Solved.

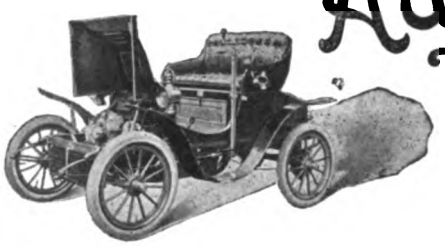
In gasolene motors the combustion of the mixture releases a great quantity of heat, of which one part is transformed into useful work, another is dissipated in the walls of the combustion chamber and cylinder, while the third escapes through the exhaust, says H. Andre in La France Automobile. The temperatures of the first two are pretty nearly equal, and after experiments by investigators it is estimated that at the moment of combustion the heat often exceeds 1,800 and even 2,000 degrees centigrade.

That extreme heat would quickly carry the walls of the cylinder to a temperature incompatible with the proper working of the motor if provision were not made for the constant cooling of their surfaces. Following on the too great elevation of temperature of the walls of the motor it would be exposed to a number of evil consequences which we will enumerate. In the first place, it would be impossible to insure proper lubrication of the cylinders, because the best oils for resisting heat will decompose at about 300 degrees, and give off carbonic deposits detrimental to the good working of the valves and motor in general. Second, the excessive and unequal expansion of the parts adjusted with great precision, notably the cylinder and piston, would interfere with the working and play of the motor. Third, there is always danger of the piston seizing; also there is fear for the welding of the head of the connecting rod and the crank; the bad effects on the valves, esjecially the exhaust valves, which receive the rush of the burning gases.

Cooling, then, is absolutely necessary. But it is not necessary to push this question of cooling to excess, because a greater quantity of heat produced by combustion will be dissipated in the walls without producing useful work than is necessary, and the efficiency of the motor will be to that extent diminished. Unfortunately, in spite of the great progress accomplished during recent years, there is not yet any well defined limit of the extent of this cooling, which constitutes one of the greatest imperfections of the gasolene motor.

The method of cooling, of whatever kind, must fulfil certain conditions, of which the following are the principal: (1) The cooling must be neither too energetic nor insufficient. (2) It must be independent of the speed of the motor, and, as a result of that, of the car.

The necessity for these conditions will be readily understood. Suppose that the water circulation is most active when the speed is greatest, and, inversely, when the motor slows on account of increased effort required, such as surmounting a hill, the cooling becomes less active, and the motor heats or tends to heat. If after slowing the motor quickens, the cooling increases with brusque



Digitized by Google

intensity, but the walls of the cylinder cool before the piston, and, on account of the slight clearance, there is a tendency to friction, resulting from the different rates of expansion produced. The best mode of cooling is that in which sudden changes are avoided, and which tends to maintain the walls at as uniform a temperature as possible.

The processes of cooling these may be divided into two main categories: (1) The processes in which the cylinder cedes the heat to the surrounding air or to cold gases introduced into its interior. (2) The processes by which the cylinder cedes the heat directly to water or other liquid which may be put into contact with its exterior or interior.

Cooling by air is generally effected on the exterior; sometimes, and especially with two-cycle motors, by a current of pure air or carbidised air introduced into the cylinder; in such case the current clears the burnt gases from the cylinder. But the most efficacious method of cooling by air is that in which the cylinder cedes the heat directly to the surrounding atmosphere. To render this method more efficient the cooling surface is increased by furnishing the cylinder with suitable ribs or flanges. These ribs generally form a part of the cylinder casting, but in some cases attempts have been made to use copper ribs because of its great conductivity and extreme emissive quality.

It is essential, however, in using air cooling by ribs to provide for renewing the air about the cylinder, and to render easy the circulation of the air about its surface. Some makers have endeavored to increase the activity of the circulation about the ribs by various devices. M. Lepape has tried a method of enveloping the cylinder in a sheath, in which he creates a forced draught by means of an extension of the exhaust. But at the end of a journey of any length the efficacy of this system diminished, and the cooling was no longer sufficient. The Hurter and G. Richard firms have tried the use of a fan in front of the ribs, but the cooling then must depend on the speed of the motor, as the fan is necessarily actuated by the latter. This means, then, that no one has solved the problem in its entirety.

Auto-Talks

NUMBER TWO.

Our first "Auto-talk" we devoted solely to *value*.

In this, the second, we will touch upon the subject of construction. While all the good points of Autocar construction cannot be covered in a talk of this length, we want to bring to your attention some of the features of the Autocar which are so obviously advantageous that they must be appreciated by the veriest novice.

The illustration above shows the easy accessibility of the Autocar motor. It is never necessary to crawl under an Autocar or to remove the body. To reach the motor you have only to lift up the hood in front. To get at the transmission case simply lift up the floor between front seat and dashboard.

The mechanism of the Autocar is exceedingly simple; this applies to both the working and the steering parts. The novice will not find in the Autocar the appalling intricacy of parts that he may have come to believe inseparable from an automobile.

The engine in all Autocars is of the two cylinder horizontal opposed type, which means that there is no noticeable vibration. The engine of the four-passenger car develops 12 actual horse power, that of the runabout 10 actual horse power. The engine is oiled automatically, is water cooled, and the number of parts is reduced to a minimum.

The autocar transmission is ball-bearing. The car is gear-driven—no chain. Ample brakes are provided.

The double spark coil used in the Autocar is of the very best and most approved type. The gasolene tank holds ten gallons, which, on good roads, is sufficient for 200 miles.

All parts of the Autocar, with the exception of bodies and tires, are made in the Autocar shops. They are made by men who have been building successful automobiles for eight years. Every part is made in harmony with every other part, so that the entire mechanism operates in perfect unity.

We know that none but the best materials go into Autocar construction, and we know that the workmanship is expert and thorough.

Autocar bodies are made for us by a leading body maker, and are finisehd like the finest coaches.

The Autocar has a speed of from 3 to 35 miles an hour. Extreme ease of control is attained through an unusually simple arrangement of levers.

The price of the Autocar Runabout, shown above, is $900; the Autocar Four-Passenger Car, $1,700.

In our next month's talk we will tell you of the Autocar's performance. Our booklet, which we send free, gives full description of the Autocar's construction, and addresses of our dealers throughout the country. You should have it.

TOURING IN HAWAII

Experiences that Added Interest to the Honeymooning of a San Francisco Pair.

Many novel experiences were met with by George A. Turner and Mrs. Turner, of San Francisco, who spent their honeymoon touring the Hawaiian Isladds in an automobile. The journey was made last summer, and all the driving was done in Mr. Turner's Rambler car, which he took with him for the purpose.

There are many fine roads to all parts of the island leading out of Honolulu, and the plantation owners are taking it upon themselves to improve the highways. Aside from the many drives on the island of Hawaii, the roads are being put into condition so that in a very short time it will be possible, by taking one of the inter-island steamers, to make a trip to Kilanea, the largest active volcano in the world. When this is finished—and it is promised that it will be by next year—it will present a most interesting trip for the automobilist. Mr. Turner intended to make this trip, but was cautioned not to attempt it, as the lava formation would ruin the tires. During the month's tour of the islands but one puncture did the tires invite, and that was caused by a nail (sent across from San Francisco).

It is quite probable that in the very near future a great many larger automobiles will be in use on the islands, not only for pleasure but for business, as the climate is exceedingly hard on horse flesh, and it is most expensive to keep equines, as there is very little feed raised, the land being more valuable for sugar cane, pineapple and other products. The cars, however, must of necessity be of ample power, as the formation of the islands is mountainous, and while the roads give evidence of much careful engineering, and as a rule exceptional care is taken of them, there are naturally many grades that would tax the power of ordinary cars.

The citizens, both native and white, are very courteous and seem to welcome the automobile. The island people took very kindly to the modern creation, and some years ago a company was formed and a number of electric machines were put on rental, but the venture was not successful, as the electric vehicles were in their infancy, and as their facilities were not of the best they caused a great deal of dissatisfa tion. There are a great many people in Honolulu now, judging from the first machines, who are quite sceptical as to the reliability of the motor car of to-day, but this is gradually wearing off, and it will not be long before machines in the islands will be plentiful.

Mr. Turner relates many interesting stories and incidents of his Honolulu trip.

"It was quite amusing," he said, "to note many ways in which the natives received the 'red devil" in some of the more remote districts. I have in mind a trip we made up the Kelihi Valley. We had been driving along at a pretty brisk clip, and in making a turn came upon what appeared to be a native picnic. We had given notice of our approach by a liberal use of the horn, consequently when we made our appearance on the turn all were on a lookout to see what was coming. A number were on the fences that lined both sides of the road, and at first sight of the machine they nearly broke their necks in tumbling off and seeking shelter, and the next moment all we could observe was black heads peeping out, reminding one very much of the action of the little ground squirrels as we pass along the road. We stopped to give them a chance to see the automobile, and very soon the more venturesome of the party approached, but taking great care not to get too close. We soon quieted their fears, and before we knew it we were in the center of a very much interested group flocked about us with their fears fully allayed."

The horses on the island show no unusual fright or timidity toward the automobiles. There are no laws or legislation against their use, and, in fact, there is not one element detrimental to a very pleasant tour of the islands with an automobile. When one considers the very low rates of transportation there is no question but what future tourists possessing automobiles will take them along on trips to Honolulu.

In leaving San Francisco the Oceanic Steamship Company accepts machines in running condition, no preparation other than the emptying of the gasolene tank being required. It is very advisable to use these steamers, as their ports are large enough to permit a machine being run into the baggage room, and this makes unnecessary the use of a rope and derrick to hoist the automobile aboard, as is the case on the other steamers to the islands. The freight on a large sized car is the nominal one of $35 a round trip, and they handle the machine with the utmost care. Mr. Turner's Rambler had company on the trip down, as the Rambler agency shipped down on the same steamer a canopy top touring car for Charles M. Cook, a prominent banker of Honolulu. Both cars went through without a scratch.

There are many finely equipped machine shops on the island, and gasolene is readily obtained, and a good quality at $3.75 per case of 10 gallons. The climate is particularly suitable for gasolene powered cars owing to the constant high temperature. The Von Hamm Young Co. carry a complete line of tires, and in conjunction with their establishment have a thorough equipped machine shop.

There are three first class hotels in Honolulu—the Alexander Young, the Royal Hawaii and the Moana, all of which either have accommodations or are arranging same for the care of automobiles.

The Palli drive is one of the most interesting trips of which one can conceive. The run is from the west to the eastern portion of Honolulu over exceptionally well kept roads, and there unfolds a view that would be hard to excel. After a descent of some five miles one suddenly is surrounded by rice and other plantations of exceeding interest. In fact, Honolulu as an automobile touring ground of exceptional interest is hard to surpass on the globe.

Mr. Turner has a few suggestions for motorists who contemplate taking this trip.

"Carry your canopy top with the machine, as the rains, while of only short duration, are a very frequent occurrence," he says. "As they are warm, however, very little discomfort is gotten from them, and no doubt they are beneficial, as they lay the dust and make touring all the more enjoyable."

Wreck Due to Politeness.

An act of politeness was responsible for the wreck of the automobile belonging to A. J. Hatch, a New York broker, whose home is in Stamford, Conn. Mr. Hatch's son, Edward, was riding alone in the automobile up a Stamford street Tuesday afternoon last, when a young woman acquaintance passed. He raised his hat to her, and as he did so the rear wheels caught in the car tracks, swerved suddenly, and dashed against the curbing. The collision demolished the front of the machine and hurled Hatch headlong to the pavement, but, strangely enough, he was uninjured.

Here's the Up-to-Date Sheriff.

Lawbreakers in Nebraska must needs be wary now, as that State boasts of at least one up-to-date Sheriff, who uses an automobile to run down persons who he thinks would be safer behind the bars than at large. Recently William Holden, a farm hand, entered the Platte Valley Bank, Platte Center, Neb., demanded the bank's cash, and on the refusal of Cashier Barney Schroeder to surrender it shot the latter in the breast, then escaped in a buggy. Sheriff Carney took up the pursuit in an automobile, and after an exciting chase captured his man.

How the Bank was Saved.

Out in Ohio the automobile has proved a valuable acquisition in time of a run on a bank. Last week the depositors in the Willoughby branch of the Wade Park Banking Co. of Cleveland heard that the bank had been affected by suits brought against it, and straightaway made a run for their savings. The bank officials telephoned to their bank in Cleveland for funds, and in a few minutes an automobile dashed up to the Willoughby institution and unloaded $ 75,000, which stopped the run and satisfied the depositors.

Saws Wood and Says Something.

Palmer Jordan, a farmer, living at Danielson, Conn., is doing almost all of the wood cutting in his neighborhood at a low rate, says the Boston Herald. He bought an old automobile in Providence recently, and fixed it up so he can attach a belt to the machinery and run a saw. He carries the saw around in the automobile, and goes from one farmer to another, cutting their wood for them.

Sarcasm of the Star.

"Everybody that doesn't own an automobile knows that the man who does is a villain and a pup," is the elegant way the Peoria (Ill.) Star puts it.

"The automobilist has been tried at the great bar of public opinion and convicted of being a murderer, a coward, a destroyer of happy homes and an enemy to righteousness and the human frame. But until recently it was not believed that he added to his other crimes that of being a trickster.

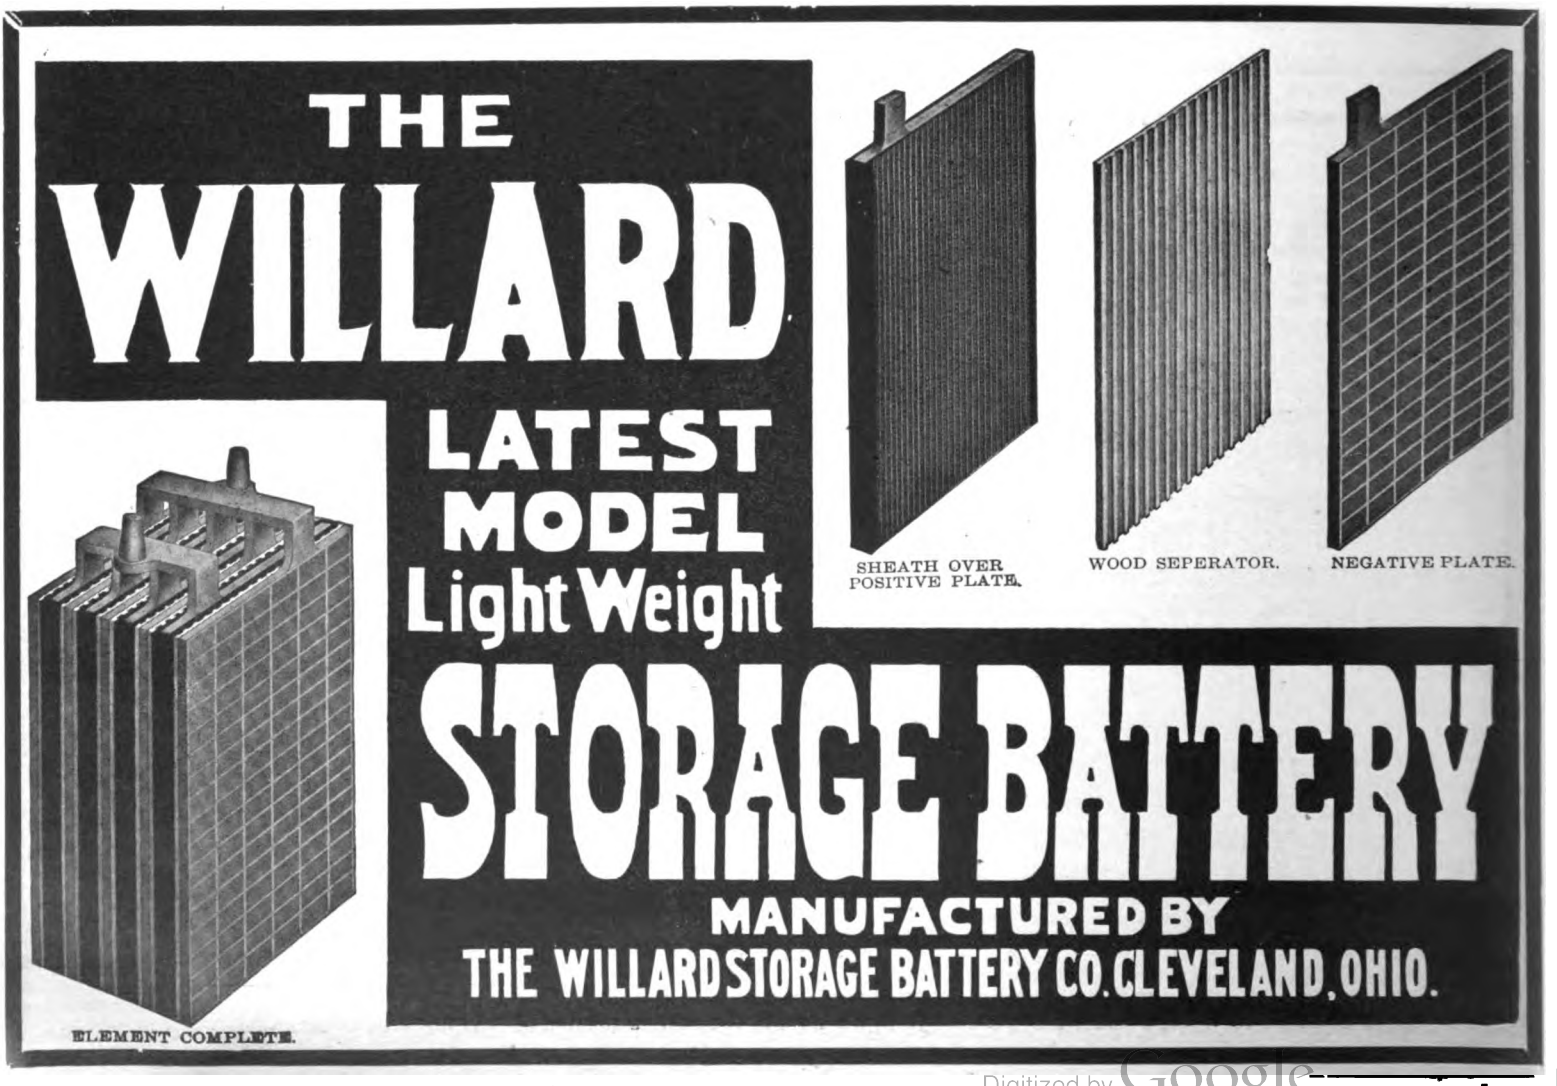
"Yet such is even the case. Not long ago, it seems, a travelling salesman of a particularly slick and insinuating sort struck Peoria. He was selling a patent device to be attached to automobiles whereby the chauffeur could so manipulate the number which the law compels him to place on the rear of his machine that it would be made invisible at will.

"Sad to say, this meretricious device for cheating the law and fooling the public found a ready sale here. In fact, it is stated that the slick salesman sold out his entire outfit in one day and had to telegraph to the house for more.

"This is a terrible commentary on the moral status of the Peoria automobilist, and shows that the poor common people are at the mercy of a lot of miscreants. For now all a chauffeur has to do is to run over a man, reverse the number on the rear end of his death dealing devil wagon and choo-choo gayly away, giving the corpse and the mourners and the sleuths of justice the merry ha-ha.

"It is said by eyewitnesses to the affair that when a big gasolene touring car ran into Mr. Frye's buggy last Sunday across the wagon bridge he applied this devilish device to his number, shouted defiance at the luckless young man and steamed carelessly over the bridge, his automobile filled with beautiful young ladies and millinery and his heart filed with black wickedness. Here is a matter for the city authorities to prayerfully investigate. If there is a naughty scheme on foot to make automobile numbers invisible and cheat justice of her prey in case of a collision, it should be run to earth, published forth to the world and the instigators thereof punished as they deserve."

Gurney is Now Safe.



Among recent purchasers of Waverly electrics is Hugh Gurney, secretary of the British Embassy to this country. His unpleasant experience a month or two ago, when a Massachusetts justice summarily fined him for speeding, and was subsequently obliged to apologize for his unceremonious treatment of a member of the diplomatic corps, will be recalled.

List! the Voice of the Farmer.

Farmers' journals are generally rabid in their abuse of everything pertaining to automobiles and their users, but the editor of the Farm Star, Indianapolis, Ind., takes an eminently sensible view of the question. He thinks it hardly probable that any radical measures will be adopted by the Indiana State legislature this session, as there has been too much heated discussion of the subject. After saying that in some parts of the State the feelings of the farmers are very bitter against automobile drivers, he adds the following:

"The automobile is here to stay. It is no longer a luxury, but it is getting to be almost a necessity. The drivers have as much right on the highways of the State as travellers that may be using any other kind of locomotion. Some automobilists have undoubtedly proceeded along the idea that no one else has any rights when they are under full speed, and this accounts for the strong feeling against them.

"A low rate of speed when passing a horse will probably be the gist of the measures that will be proposed for adoption by the State legislature. It is, of course, impracticable to require that the machines come to a full stop. The rate of speed, however, should be so low that it would be the next thing to a stop."

I HEARD DAD TELL A CHAP THE OTHER DAY THAT THOSE "YAGUE" FELLOWS WERE N'T IN IT WITH MORGAN & WRIGHT CLINCHER TIRES WHEN IT CAME TO PUTTIN' AN END TO TROUBLE

MESSRS. MORGAN & WRIGHT, Chicago.
Gentlemen—Allow me to congratulate you on the excellence of your Clincher tires. I placed them on my Packard Touring car last May, and though the car has been in constant use since, I have enjoyed the very maximum of tire comfort. **They have not given me a moment's trouble**, and to me, who, up to that time, has experienced **all** the tire worries, and **few** of the pleasures of auto driving, it is certainly a pleasure to find so reliable a tire as is yours.
Yours for the M. & W. Clincher tire, P. BRICKBAUN, M. D., St. Louis, Mo.

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builders have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of coolis worth something to our customers.

We are now shipping coolers on our 1905 orders.

THE WHITLOCK COIL PIPE COMPANY

The Week's Patents.

775,224.—Automobile attachment. James B. Mott, Fredonia, N. Y. Filed August 5, 1904. Serial No. 219,631. (No model.)

Claim.—An automobile provided with a rear deck section, means for removably securing the same in place, the deck section being adapted to engage the stationary rear deck portion of the automobile and said deck section having a closure, and means for removably holding the same in active position.

775,233.—Automobile driving gear. George C. Cannon, New York, N. Y. Filed Nov. 5, 1903. Serial No. 179,934. (No model.)

Claim.—The combination of a sectional crank shaft, said sections having flanges respectively on their contiguous ends, a gear set between said flanges, gibs bearing between the flanges and gear, and means for fastening the flanges and gear together.

12,284.—Change speed gearing. Louis P. Mooers, Cleveland, Ohio, assignor, by mesne assignments, to the Peerless Motor Car Company, Cleveland, Ohio, a corporation of West Virginia. Filed Sept. 24, 1904. Serial No. 225,834. Original No. 737,442, dated August 25, 1903.

Claim.—The combination of the driven shaft C, the shaft E, a gear e^2 fast upon the latter shaft, an endwise movable and normally inactive reversing pinion h adapted to be moved into mesh with gear e^2, a sliding gear d on shaft C, a single shifting device, and mechanism operated thereby which moves the gear d and pinion h toward each other and carries the ger d into engagement with gear e^2 and then past it, and carries the pinion h into mesh with both gears d and d^2.

775,321. Vaporizer for Hydrocarbon Motors. August Wassmann, Astoria, N. Y., assignor to Abbot Augustus Low, Horseshoe, N. Y. Filed November 24, 1903. Serial No. 182,455. (No model.)

Claim—1. In a motor of the character designated, the combination of a piston cylinder formed with a water jacket, means for introducing water into said jacket, an ignition chamber communicating with said piston cyl-

A Sharp Eye Ahead!

Driving an auto will be more of a pleasure and less of a strain on the eyes if you use EYE-FIX. This tried and true remedy strengthens weak eyes, cures watery eyes and allays irritation caused by wind and cold. It is an effective

EYE-FIX
TRADE MARK
THE GREAT EYE REMEDY

tonic for eyes that are dull, tired or overtaxed—make them bright and clear—removes the aches and pains. Quickly cures sore eyes and instantly soothes eyes that are injured by particles of dust, etc. Carry EYE-FIX in your pocket, a small vial and a dropper in a neat case. Use it in a jiffy—two drops is a dose. All druggists and opticians sell EYE-FIX at **50c.**

Every dealer in automobiles and sundries should have EYE-FIX in stock. He will find a good sale for it among his patrons.

Inquiries cheerfully answered, and we send a trial bottle, post-paid, for 10c.

inder and formed with a hood having a water space therein, means for admitting water from the said cylinder water jacket to the said hood on the igniter, means for controlling the flow of water to said hood and means for discharging water from said hood for the purpose described.

775,355. Chain Connecting Device. Cyrus E. Smith, Fall River, Mass. Filed July 7, 1904. Serial No. 215,659. (No model.)

Claim—1. In a device of the class described, the combination with a frame having spaced bearings and carrying a hook, of a shank movably extending through the bearings and having a hook, and an adjusting device engaging the frame and shank for moving the latter through the bearings of the former and thereby moving said hooks toward each other.

775,381. Motor Goggles. Harry Newbold, London, England, assignor to Jas. Atchison, London, England. Filed August 6, 1904. Serial No. 219,799. (No model.)

Claim—1. A pair of goggles comprising among their members a main frame consisting of two sections hinged together, an auxiliary frame section movably connected to each of said main frame sections and adapted to fold thereupon, and a flexible shield of fabric connected to each of said auxiliary frame sections and extending to the adjacent main frame section, whereby said main frame sections may be folded together and the auxiliary frame sections will fold upon the sections of the main frame, one set of said frame sections being provided with transparent material, substantially as described.

775,385. Incandescent Igniter for Explosive Engines. Patrick J. Shouvlin, Springfield, Ohio. Filed March 19, 1904. Serial No. 198,-914. (No model.)

Claim—1. An igniter for explosive engines, comprising an ignition tube, a flue, or chimney, surrounding the same and provided with an opening in its wall, and a burner supported on said chimney and adjustable longitudinally thereof opposite said opening, substantially as described.

775,409. Power Transmitting and Reversing Mechanism. Robert Symmonds, Kenosha, Wis., assignor to Thomas B. Jeffery, Kenosha, Wis. Filed April 9, 1904. Serial No. 202,469. (No model.)

Claim—1. In a power transmission mechanism, the combination with a driving element, of a clutch fixed thereto, a co-operating movable clutch member, a driven element, a casing carried by the movable clutch member, and gearing mechanism inclosed in said casing operatively connecting the driving and driven elements.

775,492. Pneumatic Tire for Vehicle Wheels. Adrian R. Karreman and Oreste Del Guerra, Chicago, Ill. Filed April 27, 1904. Serial No. 205,268. (No model.)

Claim—1. In a pneumatic tire, a rim, a seat secured thereto and having side walls, and means for inding said walls against a tire, combined with a rubber tire having a thickened tread, a plurality of layers of fabric within said tire and having the edges folded within the seat to form two annular chambers of substantially rectangular cross section, and strengthening braces fitting in said chambers, and through which braces the binding means of the tire is passed, substantially as described.

775,503. Change Speed Gear. Alfred Soames and Walter Langdon-Davies, Surrey County, England. Filed January 18, 1904. Serial No. 189,616. (No model.)

Claim—1. In change speed gear, the combination of two shafts, gear wheels of varying diameter on each, each wheel on one adapted to mesh with a wheel on the other and one wheel of each intermeshing pair capable of being slid along its shaft to put it into or out of mesh with the other wheel of the pair, a friction clutch, a positive clutch driven by the friction clutch and itself driving one of the shafts, a selective lever by the movement of which any pair of wheels can be brought into mesh, a pedal lever, mechanism by which the first movement of this lever disengages the friction clutch, mechanism by which the further movement of this lever disengages the positive clutch and locking mechanism by which the selecting lever cannot be shifted unless the positive clutch has first been disengaged.

775,544. Indicator for Fluid Tanks. Frank A. Rantz and George W. Collin, Bridgeport, Conn. Filed Nov. 8, 1902. Serial No. 130,618. (No model.)

Claim—1. In a fluid tank indicator, the combination with a tank having a circular opening, a movable cap threadedly attached in the ring, depending guides attached to said cap, a yoke connecting the lower ends of the guides and being of less length than the diameter of the opening, a vertically disposed spiral stem rotatably mounted in the cap and yoke, a float mounted on the guides and engaging the spiral stem in a manner to turn the same by the rise and fall of the fluid in the tank, a magnet carried by said stem, an indicating needle exterior of and attached to the cap adapted to move and register with the position of and by the influence of the magnet on the inside, and a movable cover adapted to fit upon the cap to inclose the needle, substantially as shown and described.

775,553. Carburetter for Hydrocarbon Engines. George W. Burton and Alfred F. Seibel, Toledo, Ohio. Filed May 28, 1904. Serial No. 210,162. (No model.)

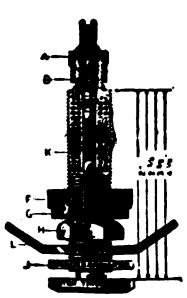
Claim—1. In a carburetter, the carburetter body having an air inlet and a mixed vapor outlet, a valve slidably mounted within the carburetter body having openings adapted to be brought into alignment with the vapor outlet, and a wedge shaped spraying chamber disposed at one end of the carburetter body adjacent to the air inlet in operative relation to said valve, substantially as described.

775,595. Dust Guard for Autocars. William H. Brown, Chicago, Ill. Filed March 31, 1904. Serial No. 201,003. (No model.)

Claim—1. The combination with an autocar, of a skirt extending from the lower portion of the car body as high as the seat, said skirt being spaced from the body and extending along the rear portion of the side of the body around the rear end thereof, substantially as described.

775,614. Carburetter for Explosive Engines. Geo. F. Swain, Harvey, Ill., assignor of one-half to Henry E. Kellogg, Harvey, Ill. Filed December 26, 1902. Serial No. 136,536. (No model.)

Claim—1. A carburetter comprising a casing having a vaporizer chamber and having a downwardly extended passage the lower end of which has a valve seat and is connected with the upper part of the vaporizing chamber for supplying liquid hydrocarbon thereto, a valve engaged with the valve seat and adapted to be opened by upward movement for controlling the passage and having a valve stem extended down into the vaporizing chamber, a foraminous vaporizer secured to the valve stem below the valve and adapted to receive the liquid hydrocarbon from said stem, said vaporizing being extended across the vaporizing chamber, means for admitting air to the vaporizing chamber below the vaporizer, and means for discharging vapor from said chamber above the vaporizer.



775,753. Vehicle Wheel. William B. Keighley, Vineland, N. J. Filed May 12, 1904. Serial No. 207,637. (No model.)

Claim—1. A wheel tire having a flat base, and an outer elastic tire, having projecting lugs secured to said flat base by means of swinging clips, substantially as specified.

2. The combination, in a wheel tire, of an outer elastic tire having undercut and transversely slotted base portions, a base tire upon which said outer elastic tire is seated, and pivoted and swinging retainers for said elastic tire occupying the transversely slotted portions of the outer tire, substantially as specified.

SCHRADER UNIVERSAL VALVE.

Trademark Registered.

SIMPLE AND ABSOLUTELY AIR TIGHT.

MOTOR TIRE VALVES, as shown in cut, are made in four lengths as shown. Cut is exactly half size of the 2 in. valve.

SUPPLIED TO THE TRADE BY ALL TIRE MANUFACTURERS.

PREMIER

"The Quality Car"

DIRECT RADIATION.

If air cooling is not going to win out in 1905 stronger than ever, then we will have about 500 Premier cars on hand at the end of the season. Our 1904 record is clean and open, and 1905 Premiers are of the same general construction as the 1904 car, with an added refinement of details not to be found in any other light car made in America. If you are a possible purchaser of a motor car of quality, you owe your own best interests an examination and trial of the Premier. Think it over.

A few first-class agents wanted in open territory.

Premier Motor Mfg. Co.
INDIANAPOLIS, IND.

IF THE RIM

LESSONS OF 1904

are taken to heart

"SWEDOH" Spring Steel Rims

are likely to be the general equipment of all good machines in 1905.

"SWEDOH" SPRING STEEL RIMS have conclusively demonstrated their superiority by the severest tests in actual service, giving results unattainable with rims made of ordinary stock.

"SWEDOH" SPRING STEEL RIMS are made true and stay true. True as "SWEDOH" steel is axiomatic.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

THE RECORD OF THE FORD.

Victory after victory is credited to the Ford light racing car. When you consider that this car gets its power from two of our standard type horizontal motors, you must admit it is proof positive of the correctness of the Ford design and construction for speed, strength and power. The Ford cars have established a record in every day use of consistent reliability and unvarying satisfaction.

MODEL B. Price, $2000.00. Henry Ford's Latest and Greatest Success.

A striking example of the distinctive Ford construction. Weight 1710 lbs. Four-cylinder vertical motor developing over 20-horsepower. This gives our car more power for its weight than any car of equal price in the world. Consequently there is less wear on the tires and ample reserve power for steep grades and sandy roads. Wheel base 92 inches, direct drive with universal coupling, cylinders 4x5 water cooled; automatic oiling devices with force feed, large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car places this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horsepower, planetary transmission, chain drive, and increased gasoline capacity. The most stylish low-priced car on the market.

SOME GOOD TERRITORY YET FOR LIVE AGENTS. WRITE US TO-DAY FOR FULL INFORMATION.

OLDSMOBILE

TO DEALERS:

We beg to announce the most complete line of light automobiles made.

7 H. P. Standard Runabout,	-	-	$650
7 H. P. Touring Runabout,	-	-	750
10 H. P. Light Tonneau,	-	-	950
20 H. P. Touring Car,	-	-	1400
10 H. P. Light Delivery Car,	-	-	1000
16 H. P. Heavy Delivery Car,	-	-	2000

The Standard Runabout is now equipped with a new carburetor. It is good for 30 miles an hour, and eats hills alive. This machine won over all other light cars and beat most of the two-cylinder cars up Eagle Rock Hill Thanksgiving Day. Can ship you a duplicate immediately.

Digitized by Google

PROCLAMATION

The new 20 H. P. TOURING CAR will be ready for early January delivery. Has double opposed ngines, cylinders 5¼x6, runs forty miles an hour, climbs heavy grades on high speed, has side door entrance, nest upholstery and finishing and is the peer of any $2,000 car on the market. Those who have seen it say it is ie ONLY low priced TOURING CAR. This car will sell quick because one demonstration will convince ie customer.

Our TOURING RUNABOUT is the car for the fastidious driver. Best looking runabout in the orld, speeds along 32 miles an hour and shows no weak heart when climbing a hill. Made three miles at Houston, Texas, on half-mile track, in 5:28.

The LIGHT TONNEAU is better than ever, more power, same good looks and easy riding qualities. i its class is a most popular car.

The 10 H. P. LIGHT DELIVERY CAR has solid tires, large delivery body and is saving money al-eady for every merchant using it. Have sold a large number of these cars and can send you excellent letters recommendation from users.

The HEAVY DELIVERY CAR will be ready for January shipment. Can build any body for it, and ie engine has ample power to take very heavy loads up stiff grades. A ten passenger car with a speed of 16 iles an hour will be ready at the same time.

Immediate delivery now and hereafter on Runabouts, Light Tonneau and Light Delivery Car. Large rs positively in January.

We have a larger line and will be in better shape than anyone else to make immediate shipment during ie rush of spring. Next season will be the biggest money maker yet for Oldsmobile agents. In the way of rofits, we certainly have the goods to offer. If we are not represented in your territory, you had better get on it. Write at once for further particulars.

The Maxwell

PERFECTLY SIMPLE — SIMPLY PERFECT

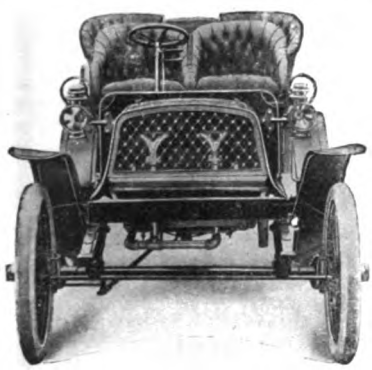
The Keynote of Maxwell Construction is Simplicity.

The minimum number of parts have been used, but into each the brain of the designer has put such thought, such study, that a maximum of practical value has been attained in each detail.

The Maxwell has no pump (thermo-syphon). Its crank and transmission case are cast in one piece of aluminum, and the double-opposed motor is so attached that they form a perfect whole. It is unnecessary to lift floor-boards or crawl under the car to get at any of the vital working parts.

The Maxwell, on account of its correct design and perfect workmanship, is exceptionally quiet, easy running and vibrationless. In every quality it is a car that will serve you well year in and year out, a practical car for practical people.

The Maxwell plant cost over $350,000, and has the most complete equipment of automobile machinery in the world. It is *not* an assembling plant, but one where every part of the Maxwell Automobile is actually made under the direct supervision of its designer, Mr. J. D. Maxwell.



This concentration of energy under one roof puts us in a position to promise our customers that promptness of delivery and absence of red tape that so often hampers the agent in making sales.

Although a new firm, the Maxwell-Briscoe Motor Co. is old in experience. Both Mr. Maxwell and Mr. Briscoe have been closely allied with every improvement in construction since the invention of the automobile. For twelve years they have been steadily working toward the completion of this car. Everything that patience, brains, and capital can do, has been put into its construction—the result is perfection.

Write us for information.

MAXWELL-BRISCOE MOTOR COMPANY, - - Tarrytown, N. Y.

The Quality Car
PREMIER

With 1905 deliveries daily leaving our old plant, our new plant practically ready for occupancy with a doubly increased output, and nothing carried over from last season but a *long* list of contented and satisfied agents and drivers, we start the Premier on its 3d successful *year!*

(*The air cooled has no season*).

Our rush has started. Yours will soon begin. Think now and write us,

Premier Motor Mfg. Co.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

BRINKS C. C. EXPRESS CO., City.

Gentlemen:—Below please find report of the Waterless Knox Gasolene Express wagon that we have had in use for 12 days and 12 nights. Eighteen hours divided into two shifts of 9 hours each, covering 150 miles per day of two shifts between Evanston, Oak Park and Woodlawn, and making between 6 and 8 trips during that time, not missing a schedule trip except one trip of two hours, when an electric car ran into the auto, dishing one wheel.

The machine used 20 gallons of gasolene a day of two shifts, or about one gallon for each hour run. When we put this machine on we laid off three wagons, twelve horses, and they have been off during that time, the horses being used elsewhere in the business. We used two of the men on the auto and dispensed with the services of the other man.

By an investment of $2,450 for this Knox machine we can improve deliveries in our business, get better service and save the cost of feeding above horses, one man's wages and the investment in the future of three wagons, harness, etc. We recommend the purchase of said auto.

Respectfully submitted, A. P. BRINK, General Mgr.
Superintendent, W. B. WYNE.

Rambler

SURREY, TYPE ONE. 1905 Model.

2 CYLINDERS, 16 H.P., $1350. IMMEDIATE DELIVERY.

Thursday afternoon, October 13, Arthur Gardiner, whose name was formerly well known on the cycle track, and who now is final tester of every RAMBLER car made, drove the writer in a new Surrey, Type One, for a twenty mile run about Kenosha. The country is perfectly flat, and the black soil makes poor roads, deeply rutted, so that this high speed run furnished no hill climbing, but plenty of spring and power testing, as a narrow, deep rut made by farm wagons in soft roads pinches pneumatic tires, and tests the springing by side crooks. Part of the time the car had four passengers and part of the time it was on very bad, soft, muddy, uneven roads, always riding very smoothly, without the slightest tremble of the free front ends of the mud guards, which is most convincing proof of entire absence of vibration, and always with abundant power to spare. The car is as still as it should be, silencing perfect, no bouncing, easy side swing, and prompt response in every particular of control.—HUGH DOLNAR, page 86, *et. seq.* *Cycle and Automobile Trade Journal*, November, 1904.

We shall be pleased to send you a copy of THE RAMBLER MAGAZINE, and other printed matter, free, upon request.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, December 8, 1904. No. 11

WILL LOOSEN PURSE STRINGS

N. A. A. M. Plans Expenditures for Many Purposes—Parts Show Receives Scant Attention.

Although they came to yesterday's meeting at New York headquarters fully primed on the subject, by a six or seven-page typewritten letter giving reasons why a separate show of parts is necessary or desirable, the thirteen members of the executive committee of the N. A. A. M. who were present made short work of it when it was brought up for action. It did not come up until very late in the afternoon, and evoked little, if any, discussion. Instead, it was promptly referred to the show committee "for detailed consideration," as the secretary expressed it. It is stated, however, that the idea of a parts show did not meet with the unanimous favor that was supposed would be the case.

In many respects quite the most important action of the meeting was the recording of a motion favoring the institution of a test case to determine the legality of those laws requiring automobilists to register and carry license tags. A committee to confer with counsel and outline the best mode of procedure and to select the battlegrounds was appointed and will render a report at the next meeting. As the counsel of the association had previously given as his opinion that such laws were unconstitutional, there seems small doubt but that a test case will be undertaken. It will be fought to a finish, too.

A committee was also appointed to investigate the present status of the Brownlow bill, which makes for Federal aid in road improvement, and also the status of good roads movements generally. This committee, likewise, will report at the next meeting.

A contribution of $500 to help to defray the deficit of the Vanderbilt Cup fund was voted.

It was voted also to abandon the annual banquet and to promote instead a smoker and entertainment on a large scale on Friday of the New York show. The idea is to hold a general entertainment and jollification, which may be participated in by agents not less than manufacturers. The annual meeting of the N. A. A. M. will be held on Wednesday of the same week.

Meteor Falls Into New Hands.

W. L. Colt, sales manager of the Federal Mfg. Co., has resigned that position to become the head of a new company, the Cleveland Motor Car Co., which has been formed to market what has been known as the Meteor car, heretofore sold by the Worthington Automobile Co.

As a section of the trade has been aware, the Meteor was constructed by the Federal Mfg. Co. for the Worthington people, but, as the Federal Mfg. Co. were not inclined to enter the market as manufacturers of complete cars, the new company is the direct result. The Cleveland Motor Car Co. will have headquarters in the city from which it takes its name.

Two Quit in New England.

Two New England concerns are in process of liquidation, the Pope-Robinson Co., Hyde Park, Mass., and the Crest Mfg. Co., Cambridge, Mass. The former, as The Motor World stated two weeks since, have disposed of their Selden license to the Buick Motor Co., Flint, Mich., and the winding up of the concern is the direct result.

The Crest Mfg. Co. have been on financial shoals during the year, and for some time its future has been problematical. A "for sale" sign on the factory at Cambridge, however, seems to settle all doubts on that score.

Exports Regain Strength.

After an interregnum of two months, when losses were recorded, the exports for October show the usual gain. The figures are $130,891, as compared to $119,131, in October, 1903. For the ten months of the fiscal year the figure are $1,576,877, as against $1,311,960 in the corresponding period of 1903, and $970,610 in 1902.

Snell Changes Name.

The Snell Motor Car Truck Co., of Toledo, Ohio, has changed its name to the American Motor Car Truck Co.

DON'T FAVOR PARTS SHOW

Accessory Makers Express Dissenting Opinions—Busy Session of M. & A. M. in Cleveland.

Cleveland, Dec. 3.—While it did not come before them officially or for action, the suggested parts show—exclusive mention of which was made in last week's Motor World—was freely, if informally, discussed by the directors of the Motor and Accessory Manufacturers at their meeting here to-day.

It cannot be said that they are whole heartedly in favor of the idea. The prevailing sentiment seemed to be that while such a show might prove an excellent thing for purely parts makers and makers of commercial vehicles, it would not appeal specially to makers of accessories, inasmuch as the latter are almost as intent on reaching the public as they are on reaching the trade. As one of the directors expressed it: "The parts show, if brought about, would simply require that the makers of accessories be subjected to additional expense without adequate returns, because, even if they exhibited at the parts show, they would still desire to be well represented at the automobile exhibitions. It would impose a burden of two or three shows, instead of one or two, as at present."

Those present at the meeting were President D. J. Post, H. E. Raymond, W. S. Gorton, Harry T. Dunn, R. H. Welles, F. E. Castle, H. S. Chapin, V. E. Apple and P. Hussey.

While it had no reference to the matter, the M. and A. M. took action that will facilitate consideration of the parts show in the event that the National Association of Automobile Manufacturers should elect to favor such a project—that is, they appointed a permanent committee of five, with H. E. Raymond as chairman, to confer with a similar committee of the N. A. A. M. on all subjects of mutual interest which may arise from time to time.

There was also appointed a committee to see that the M. and A. M. exhibits receive their due share of attention at the New York Show. Among other things, the committee will arrange for the display of suitable signs

Digitized by Google

directing the throng to the restaurant and balcony, where the accessories exhibits will be displayed.

At to-day's meeting the following concerns were admitted to membership Utility Mfg. Co., New York; Wheeler Mfg. Co., Detroit, Mich.; Long Mfg. Co., Chicago, and the International A. and V. Tire Co.

Incidentally, the directors issued sanctions for the Detroit and Cleveland shows.

It was voted to hold the next annual meeting of the organization on January 13, 1905, at 8 p. m., at the Astor Hotel, New York.

Woman Blocks Fox's Way.

The situation following the falling out of Frank A. Fox with the Eisenhuth Horseless Vehicle Co. has almost a comic opera aspect. Fox, as was exclusively stated in last week's Motor World, entered suit against the company for $8,000 for alleged breach of contract, and promptly attached what is supposed to be the only Graham-Fox compound car which the company had succeeded in producing in about a year's time. When Fox woke up, he discovered that Miss Mary G. Read, the secretary of the company, had previously attached the property on a claim of nearly $25,000, and, following Fox's action, she promptly replevined the car, and the case is made returnable for the first Tuesday in February next. Miss Read, Fox's attorneys claim, gave a bond for $4,500, the soundness of which they question. Accordingly, they have made a motion that a new bond be substituted, and this motion will be argued on December 29.

The car is now in the possession of the Sheriff, and the Eisenhuth company are in a considerable stew, as they desire very much to get hold of it in order to display it at the New York show. As it is the only one in sight, they must get it or they will be numbered with the absentees.

Buick Selects Sales Managers.

Charles Van Horne, who was for many years the sales manager of the Gormully & Jeffrey Mfg. Co., when its Rambler bicycle was in its heyday, has been appointed sales manager of the Buick Motor Co., of Flint and Jackson, Mich. That he brings to the position a ripe experience goes without saying, and it may be added that he is an uncommonly conscientious gentleman. In the East H. J. Koehler, the well known dealer in New York and New Jersey, will act as assistant sales manager. From Newark he will handle a goodly share of the Buick territory in this part of the country.

Takes On the Thomas.

The Autovehicle Co., of Newark, N. J., has closed with the E. R. Thomas Motor Co. to handle the Thomas line in 1905. Manager George Paddock went to Buffalo last week and closed the deal, paying a deposit on an order for twenty cars. With the Olds and the Thomas the Autovehicle Co.'s line is complete.

ABUSING THE GUARANTEE

Replacement of Parts Leads to Some Despicable Tricks by Unscrupulous Dealers.

"Of all the mean tricks I ever came across the worst is that played by some utterly unscrupulous and inherently depraved people, who play hocus pocus with parts sent them by makers under guarantee. The lengths to which some of them go is almost inconceivable," said the manager of one of the Eastern branches of a big manufacturer to a Motor World man recently.

"It is no more or less than downright stealing, in the first place; and it frequently causes complications and no end of trouble. Furthermore, there is more of it done than you will readily believe. It must take a lot of nerve, combined with an utter lack of conscience—and most of us have a little of the latter—to bring a man to the point of perpetrating a double fraud, as he does when he gets a part from a maker free under a guarantee, and then sells it to an unsuspecting customer, who is entitled to the part without charge.

"I have one agent; or, rather, ex-agent, for he no longer represents us, who, I am convinced, made a regular practice of 'doing' us by selling the parts he got from us under guarantee. But he was very slick, and we never could catch him "with the goods on," at least not until his connection with us was ended.

"The worst thing I ever knew this man to do came to our notice not long ago. The home office sent me a letter from a man in Northeastern Pennsylvania, ordering a certain part. We sent it, and got back word that it would not fit. In ordering he had merely given the model number of his car, so I wrote him for the number of the car itself. Back came word, and then I wrote him again, saying that if his car was No. So and So, the part we had sent him would fit, and that I would stake my word on it. By wire came word that it didn't fit, or come anywhere near it, so I knew there must be something wrong, and jumped on a train and went over there.

"On the way over I got to thinking about the matter, and I build up a theory about it. The theory was that there was something wrong about the number. What it was I didn't know, but I connected my suspicion with the fact that the place where our customed lived was the territory of the agent I have mentioned, and felt that there was some queer game up. Sure enough, the instant my eyes fell on the car I was 'on.' Instead of being the car the number given indicated, it was an entirely different model. Yet the number plate was there; of that I satisfied myself.

"A little conversation with the owner enabled me to see through the matter. The dealer had in some manner got hold of an extra number plate, and when the customer came along and wanted that model car, he, being out of it and having another model of a somewhat older date, had simply changed the plates and foisted the old one on him at the price of the new one.

"But that was not the worst of it. This same dealer had received from us a short time before an entire new engine, to replace one that had developed some defect, and was not exactly as it should have been. Rather than have a dissatisfied customer we had replaced the engine free of charge. Would you believe it, the agent had put it in this car and made the owner pay full price for it! There was a situation for you. And yet that dealer is handling several reputable lines of cars and poses as an honest man."

Plainfield Garage in Trouble.

An order was secured in the Court of Chancery at Trenton, N. J., last week, directing that the Plainfield Automobile Garage show cause why an injunction should not be issued and a receiver appointed to take charge of all the property of the defendant. The complaint is made by Andrew H. Wilson, who claims that he owns five shares of the capital stock of the company, and that the company is indebted to him for moneys loaned in the sum of $1,467.75.

The complainant alleges that the liabilities of the company amount to over $2,400, while the only assets are a book account of $138; office fixtures worth $500 and tools and machinery valued at $450. It is alleged that the company is hopelessly insolvent, and has no funds with which to carry on its business.

The order carries with it a temporary injunction restraining the company from transacting any business pending the litigation.

R. F. Von Minden, counsel for William B. Smith, said that as to the direct cause for the bankruptcy he preferred to remain silent for the present. Smith, Andrew H. Wilson and Charles H. Thornton are the stockholders. The company will not be reorganized.

Smith is a brother of Mrs. Charles L. Fair, who, with her husband, was killed in an automobile accident in France about a couple of years ago. He recently received considerable money from the estate, and invested a portion of it in the Plainfield concern.

Royal Enters New England.

The Royal Tourist is preparing for no ordinary reign in New England next season. The first step in that direction is the consummation of arrangements with the New England Automobile Co. for the handling of the well known Cleveland car. The New England Automobile Co. will be centrally located in the thick of Boston automobiledom at No. 182 Columbus avenue, in the store long occupied by George J. Dunham, who will be the manager. The initial order which secured the agency is understood to have been a plump one, and other plans are now afoot which seem to assure that the Royal will prove very much a factor in the New England States during 1905.

NEW YORK GARAGE GUTTED

Fire of Uncertain Origin Causes Big Loss—Firemen Use Axes on Tires.

What proved to be the first fire of moment in a New York City retail automobile establishment broke out at 1 o'clock last Monday afternoon in the garage of the Standard Automobile Company, at 146 West Thirty-ninth street. Thirty cars were burned, entailing a loss estimated at $150,000. Twelve of the burned cars were not insured. The only one of the cars in the garage at the time which was saved was the machine belonging to Mayor McClellan, which was pushed out by hand.

Every effort to trace the origin of the fire has failed. Cigarettes, sparks from an ignition device and others have been advanced as the cause, but the most plausible is that some loose gasolene on the floor came in contact with blazing coals that had fallen out of the heating furnace, which, as there was no basement, was in the rear of the garage.

The first man to discover the fire was the driver of a gasolene wagon belonging to the Valvoline Company. He had driven into the building and had attached the flexible feed pipe from the storage tank to his wagon. He heard a crackling sound behind him, and when he turned saw a sheet of flame coming from the rear of the building. He did not have time to uncouple the feed pipe, because the fire was so near, but drove the wagon out of the building, the coupling being broken and a stream of gasolene following the wagon out of the place and over into Seventh avenue. This gasolene caught fire from the flames in the garage and a stream of fire trailed the wagon until the driver jumped off the seat and smothered the flame with his coat.

The building was of two stories, and the eighteen men on the upper floor were all forced to jump from the front windows to save themselves. Eight of these men received injuries, two of them having broken arms or legs and internal injuries. The seven cars which were on the upper floor were totally destroyed, as was a motorcycle, which had been built by C. O. Snyder, superintendent of the repair department. One of the cars was the racing machine which Peter Cooper Hewitt had built as a candidate for the American team in the James Gordon Bennett Cup race this year, but which was not completed in time. M. C. Hermann lost two Panhards of 24 and 70 horsepower, but both were insured.

There were quite the usual number of wild stories regarding explosions, but Fire Chief Croker said to a Motor World man: "The only explosions that I could find any evidence of were the gasolene tanks of two of the machines that were on the upper floor. Some of the tires of the machines on both floors exploded from the heat, but that was all. There was no evidence that I could find that an explosion caused the fire."

When Manager R. H. Weaver, of the garage, went to the building after the fire to let the water out of the tanks of the machines to prevent them from freezing, he was denied access to the place. He had to obtain permission from the chief inspector of the department before he was allowed to enter the building and empty the tanks. Many of the tires on the cars were chopped open by firemen in spite of Weaver's remonstrances. One fireman said he had been ordered to chop open all of the tires, as many of them were in flames.

Louisville Concern in Straits.

In spite of the fact that E. R. Thomas, the millionaire motorist of this city, was a large stockholder and a brother-in-law of the executive head of the concern, the Motor Vehicle Co., of Louisville, Ky., is in the hands of an assignee and its business will be wound up. The deed of assignment, naming J. S. Tracy as assignor, was filed last week. While no list of assets and liabilities is yet obtainable, it is stated that they are equal.

The concern has done a large business in automobiles of all descriptions, and attributes the enforced suspension to the fact that a great amount of capital has been tied up in the most expensive cars, numbers of which have remained on hand and have deteriorated.

The stockholders are R. Wortham Otter, of Louisville, and Edward R. Thomas, of New York. Assignee Tracy is Thomas's representative, and was agreed on as assignee by both Thomas and Otter.

The Motor Vehicle Company was established by Otter and J. Kemp Goodloe and Thomas, who is Otter's brother-in-law, purchased stock when Goodloe dropped out.

Five Exhibitors Get More Space.

Five of the exhibitors in the New York hsow have been made happy by increases in the size of their respective spaces. The "fortunate five" are the Winton Motor Carriage Company, E. R. Thomas Motor Company, Haynes-Apperson Company, Knox Automobile Company and the Olds Motor Works. The first four fell heir to the space declared vacant by reason of failure to qualify of the Crest Manufacturing Company, Black Diamond Automobile Company, Automotor Company and Upton Machine Company. The Olds enlargement is due to the courtesy of the Locomobile Company, who tendered a slice off their space.

Caille Completes its Car.

The Caille Bros. Co. of Detroit, who are large makers of slot machines, have completed their first car, which will be styled the Du Brie-Caille, in honor of its designer, Stanley N. Du Brie, M. E. It is of the two-cycle type developing 25 horsepower, and is a large, good-looking vehicle, that should claim its full share of notice.

FIGHT OVER FIATS FINISHED

Local Firm Gets Court Decision, and Exposition Cars are Turned Over to Them.

After waiting more than eight months, Hollander & Tangeman, of this city, have obtained possession of the two Fiat cars that were exhibited at the St. Louis Exposition. The curious case was settled last week, and, apparently, in an amicable fashion, after months of litigation, judgment by consent having been given.

It will be recalled that last spring Elmer P. Hollander, of the firm of Hollander & Tangeman, applied for the possession of two Italian automobiles which were on exhibit at the Palace of Transportation at the World's Fair, under the control of Fabbrica Italian di Automobili of Turin, Italy.

The petition claimed that the machines had been paid for by Hollander and were his lawful property. In the meaning of the law the Palace of Transportation is a bonded warehouse of the United States, and property exhibited there is free from duty and may not be removed unless by authority and until the duty is paid.

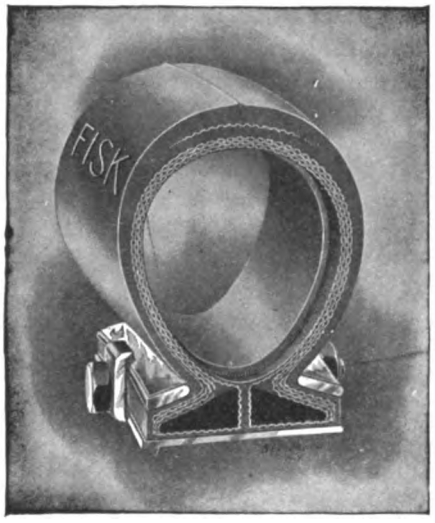
Hollander alleged that he had offered the amount of the duty to Charles F. Gallenkamp, Supervisor of Customs, and that the money had been refused, because the plaintiffs were not the consignees of the machines. As the machines were in the custody of Gallenkamp for the duty, he was made a defendant in the case, as also were the Louisiana Purchase Company and Giovanni Branchi, the agent for the Italian manufactory, who had the machines in his charge.

The cars were brought to America on March 31, and were received by Branchi, who placed them in his exhibit at the World's Fair without the consent of the owners.

A claim of $1,000 damages was put in by Hollander against the Italian company for holding the machines. The petition stated that he had made several applications for the possession of the machines, and that he had suffered in that amount by not having them. A further claim of $7,000, the value of both machines, was asked in case the machines were not delivered.

The plaintiffs paid the costs in the suit and the duty on the automobiles. United States Marshal Morsey removed them from the Transportation Building, and turned them over to Hollander.

Gallaher Loses His License.



E. B. Gallaher, New York, is no longer a member of the Association of Licensed Automobile Manufacturers. His Selden license was revoked last week because, it is understood, of nonpayment of royalties. During last year, Gallaher, who filled many roles in the trade and whose career has been marked by considerable nimbleness, handled the Richards-Brasier car. His was merely an importing license, to which some history is said to attach.

The Slam-bang Driver.

During the present period when the manufacturers of automobiles are making machines faster than decent drivers can be educated, the manufacturer has to suffer financial loss, and because of some circumstances quite beyond his control.

Many of the drivers buying cars do not realize, for instance, what tremendous power they are handling. They start their cars suddenly and stop them suddenly. They apply the clutch so suddenly that the heads and backs of the people in the wagon are seen to snap disagreeably. The driver himself does not seem to notice it. In the first place he is prepared for the shock, as he is in the habit of starting in that way. Then it seems to be a fact that the driver who has this habit does not mind little things like this; he seems to think it part of automobiling to be yanked around roughly. He has no delicate sense of touch or feeling apparently, and the machine's occupants have to suffer.

It is common practice in engineering to calculate a machine that is going to stand sudden blows by impact at double the strength of a machine that would not be strained in that way. It is a fact that a careless driver will throw double the strain onto the parts of his machine that a careful driver will put on it under the same circumstances. To be sure, the machine is made to stand three or four times what is absolutely necessary, but this does not mean that this same machine will last as long and give as good satisfaction when submitted to sudden strains continually as it will when treated properly. It simply will not do so.

There is little use preaching on this subject because a driver who has not the right touch in the first place will hardly acquire it through any amount of advice. He may get it pounded into him after paying repair bills and shifting around from one machine to another in hopes of finding one that will stand the kind of treatment that he gives a machine. Experience will show him that all machines can be smashed if abused. Then he may listen to reason and be willing to believe that his treatment is not good treatment.

The Deposit System.

In the increasing eagerness to dispose of factory outputs there is apparent a disposition in some quarters to modify or abandon altogether the agent's deposit system. This was at one time strictly adhered to almost universally, and even now it is the prevailing custom. The dealer who makes or renews a contract to handle a certain make of car in his territory binds the bargain by making a deposit in cash, which is nothing more or less than a payment on account of the cars ordered. It is, therefore, more than an evidence of good faith on the part of the purchasing dealer; it helps, even though in small part only, to pay the cost of production and does much to assure the maker that the cars ordered will be taken and paid for.

A policy of this sort is replete with pros and cons. Automobiles run into money at a tremendous rate. Half a dozen even of the cheapest stand for several thousand dollars, and twenty-five cars cost the maker tens of thousands of dollars and months of time.

It is only natural, therefore, that he should want some positive assurance that his product shall be accepted and paid for when it is completed and ready for delivery. It is not sufficient that a dealer shall possess a fair rating in the commercial agencies, or that his order is a bona fide one. His money may take wings or become tied up, or the inclination to carry out his contract may no longer exist when the time comes to carry it into effect. The deposit forms the link that binds the maker and the dealer together and makes it reasonably certain that they will jog along together amicably, at least during the life of the contract.

The amount of the deposit is neither too large nor too small. It is seldom over $100 or under $50 per car. If it were more than the former sum, it might render the maker indifferent to the wishes of his customer, as the latter would have too much money posted to regard with equanimity any fracture of the contract or even any strained relations. Viewing it the other way, if the amount of the deposit were to be materially reduced the dealer's stake would be too small, and he might feel at liberty to take strong ground on any subject in which he was interested.

It is obvious, therefore, that the passing of the custom or its material modification would greatly influence trade conditions. Yet, as stated, there are indications that it will not be so strenuously upheld in the future as it was in the past. There are several concerns that no longer regard it as a cardinal doctrine in their policy, and the approaching season may witness accessions to the ranks. Without deposits to bind the contract the contract has little force, and it is the easier entered into by the party of the second part on that account, for he does not have to lock up any money, and if when the time for delivery comes around he has changed his mind about the cars, there is nothing to prevent his declining to receive them. But it is not easy to see what solid advantage accrues to the party of the first part—the maker. He is, it is true, enabled to dispose of his estimated output, quickly and easily—on paper. But he does not know that deliveries will ever be taken, and it is not easy to see how he can count with any certainty on disposing of his product. By overselling largely he stands a good chance of having all the cars he actually turns out taken off his hands, and this is probably the actuating cause in the matter, for a dealer will be more ready to place an order for cars when he is not called upon to make a deposit, and if the dealer can sell more cars than he has paid a deposit on he will very quickly call on the non-deposit ones. It is equally beyond question, however, that if the dealer is caught in a

Digitized by Google

bear market—that is, finds his sales falling short of the number contracted for—he will sacrifice the non-deposit cars without the slightest hesitation. In the one case he loses nothing, while if he closes the season with, say, ten cars on which he has paid a deposit of $100 each, in the maker's hands awaiting shipping instructions, he stands to lose $1,000 unless the maker will agree to release him.

It is true that the latter will frequently do this, if he is convinced that the dealer "played fair" and really tried to dispose of the goods he had ordered. But if a car that has no deposit system is pushed instead, the maker of the deposit car is not likely to be in a generous mood.

Owners Not Blameless.

We are so accustomed to viewing the automobile owner as an unwilling and impotent victim of the unscrupulous chauffeur that it will come to many of us as a shock to learn that, in the opinion of many well posted tradesmen, he really holds the key to the situation; that he can do more to bring about a reform of the nefarious abuses that cry to high heaven than any other man. This aspect of the matter, which is treated at length in another column, is new and full of instruction.

An owner who is an unwilling victim of a system of "graft," and who is helpless to restrain the midnight marauderings of his hired man, is one thing; quite another is the owner who supinely permits himself to be despoiled and the public to be annoyed and even put in peril because he will not take the trouble to act. Yet it seems indubitable that he is the latter rather than the former. He can, if he only will, act, either in conjunction with the garagekeeper or with the decent chauffeur, to bring about a sweeping reform. Nor does he need to go to any great trouble in the matter. It is sufficient to back up dealers and garagekeepers who are laboring to eradicate the evils that are so loudly complained of, and who will succeed if they are given the support that they should receive.

Publicity is a good thing and the automobile is receiving its full share of it. But there can be too much publicity—or, rather, of the kind that does harm instead of good—and the unrestrained and vociferous chaffeur has been the medium through which it has received an undesirable notoriety. Not only does this arouse antagonism on all sides, but it acts as a deterrent to tens of thousands of people who would be probable purchasers but for the harrowing tales that journals other than the yellow kind regale their readers with. Alike for the good name of the motor vehicle and the prosperity of the industry, it is necessary to call a halt. United action on the part of owners and the better class of tradesmen will have the desired effect.

Really the automobile world is ungrateful. On three several occasions of late the Motor Age has wandered out on the prairie, and, climbing a stump, has patted its back, pointed a proud finger at itself and screamed like a tin eagle. And yet neither the Chicago nor the Hudson rivers have burst into flame, and no one has heard even an echo of the scream or seen a single hat streaking the horizon. It's a downright shame! Indeed, it is. But if the Motor Age will get from in front of the mirror long enough to scan the first pages of the Motor World for a year or two past, and even as late as last week or the week before, it may discover why its cries have failed to strike responsive chords. The Motor World's "scoops" are so numerous and so regular that they have become a part of its existence. They are not so extremely rare as to require the use of skyrockets or megaphones, nor have they required that publication of the paper be delayed either twenty-four or thirty-six hours in order to obtain them.

Revere Beach, the chief point of interest on the Massachusetts boulevard of that name, is a modified Coney Island. The fact that automobilists are prohibited the use of the highway except during the icebound months seems to suggest rather that the Massachusetts crowds walk in the middle of the road or cannot be trusted to take care of themselves. Automobiles are not barred from Coney Island, and there probably are more women and children there in one week than there are at Revere Beach in an entire season. In fact, an automobile ride—of about half a mile—for "ten cents a ride" is one of the many features of the Island. It is a real snorting touring car, too, and, unlike the fearsome Bostonese, "the women sigh for it, the children cry for it."

It is a significant fact that steel manufacturers are at last awakening to the importance of the automobile industry as a large consumer of steel in a wide variety of forms. So astute an observer as Charles M. Schwab is quoted as saying in a recent interview:

"Here is something that I am investigating just at this time," (indicating a catalogue of automobile parts made of steel.) "I am looking up a plant for making all these fine grade parts for automobiles, chains, gears, etc., and I am going to make every one the best that can be made, with the highest equipment for that sort of work."

It does not take a prophet or the son of a prophet to see that the trade of automobile makers will, ere long, be eagerly sought by steel mills. Indeed, a marked change has already taken place in the attitude of steel making concerns, and, as pointed out in another column, the buyer of automobile steel no longer has to beg mills to take his orders and wait their good pleasure in filling them.

It is interesting, but scarcely surprising, to learn that M. Thery has been busy since his return to Paris explaining why he figured as an "also ran" in his first, and last, essay at track racing in this country. His explanation lacks both point and pertinence, and it can scarcely be regarded as convincing even by his compatriots. It is this:

"French cars are very much superior to American cars. My successive defeats proved nothing at all. With a little training the French competitors would easily beat all American adversaries."

M—m. Yes, perhaps. But it would be wise not to make the training too little. It will be recalled that Thery did a little training at the Empire City track in preparation for the four cornered event in which he was beaten by a long margin in the slowest heat of the three.

If they have not already done so, the automobilists of Massachusetts certainly should have engrossed glowing resolutions of thanks to the Metropolitan Park Commission for their action in permitting automobiles to use the Revere Beach Boulevard during the months of snow and ice, when it is practically abandoned by the general public. Such generous, gracious action in thus permitting the automobilists to use a public highway for which their money helped pay, should not be allowed to pass unheeded. Hung in the office of the Park Commission, the resolutions a few years hence will prove an interesting exhibit of the "witch days" of automobiling in the Bay State, and also of the strenuous fashion in which the descendants of revolutionary stock fought for their rights.

TOWING PROS AND CONS

Opinions are Divided as to Wisdom of Farming it Out—Its Legal Status.

Considerable difference of opinion exists among dealers in this city regarding the method to be followed in towing disabled cars. Some concerns prefer to attend to this disagreeable duty themselves, as they have in the past, while others deem it the better plan to turn the work over to others and thus shift from themselves the responsibility for the undertaking. There is still a third class which is opposed to towing at all, preferring to make repairs, where possible, at the point where the breakdown occurs.

The matter is receiving greater attention among local tradesmen than has been given it for some time. This is due in part to the decision handed down by a Long Island judge a few weeks ago, holding that the concern doing the towing, and not the owner of the car, was legally responsible for any damage that may be caused either by the towing or the towed car. The case before the court was a suit brought to recover damages caused by Frank H. Croker's racing car, which was being towed to New York after the Vanderbilt Cup race in October last. The suit, which was brought against Croker, was dismissed, the court holding that the plaintiff had recourse only against Smith & Mabley, who were towing the car to their garage.

Among the recommendations made by the Rate Committee of the New York Automobile Trade Association, as exclusively reported in last week's Motor World, is one bearing on this question of towing. Attention is called to the fact that the legal responsibility in case of damage lies with the concern doing the towing, and not with the owner of the car. "In towing customers' cars into your garage you are responsible for any damage inflicted either by the car towing or the machine towed or to either one of them; further responsible for accidents to pedestrians or the public in general and subject to suits for damage if any is inflicted," says the committee. "For this reason it may be stated that ararngements can be made with outside parties for towing if so desired. One member reports being able to make very satisfactory arrangements with the New York Transportation Company whenever a tow is required."

While some of the local dealers are very glad to turn the business of towing over to a concern making a specialty of the business, and thus wash their hands of all responsibility, others are not disposed to view the matter in the same light.

"I am glad the matter has been gone into and the situation made plain, so that the trade knows just what responsibility is being incurred," said one branch manager whom the Motor World man interviewed on the subject. "But, at the same time, we shall make no change in our policy. To begin with, we do not have much towing to do, and when the necessity arises we much prefer to take charge of the job ourselves and bring the car in quietly and without fuss. It is true that we are liable for any damage that may be caused, but as our men are careful and experienced, the risk is not great; certainly not of enough importance to cause us to go outside of our establishment when a case of this kind comes up."

Similar views were expressed by another dealer who was seen. "It can readily be seen, however," he added, "that some concerns will find it to their advantage to act on the committee's recommendation. An urgent case may arise, and at that precise time it may be impossible to dispatch a car and a couple of men for the purpose of towing a disabled car home, and a great deal of inconvenience is saved by simply turning it over to some one else. To be thus freed of responsibility is also a considerable relief, especially in the case of a small dealer, who cannot afford to saddle himself with any big risks."

"We make it a practice to discourage towing," said another branch manager. "Of course, where any serious breakdown occurs, there is nothing to do but bring the car in and have it put to rights in the shop. But many times the trouble is a trivial one and can be remedied on the spot or, at most, in some nearby garage. A good workman can accomplish wonders, especially if he knows before he leaves the shop just what the trouble is. This plan presents the additional advantage of avoiding publicity; it leaves a bad impression on people to see a towed car go by, as it strengthens the belief, so prevalent in some quarters, that automobiles are continually breaking down."

Stoddard Interests in New Company.

The Stoddard Manufacturing Company, the big Dayton, Ohio, implement concern, which has been experimenting during the past year with an automobile, has decided to embark upon its manufacture. With that end in view a separate company, to be styled the Dayton Motor Vehicle Company, will be formed, and to it will be turned over the rights, title and interest in the car. The latter will be styled the Stoddard-Dayton, and will be regularly finished in pearl gray. It has been run in Dayton and other cities for six months past, covering some 12,000 miles and proving most satisfactory. Its noiselessness is a feature that is especially commented on.

A portion of the Bainbridge street plant of the Stoddard Manufacturing Company will be leased by the Dayton Motor Car Company, and the work of manufacture prosecuted there. Special tools and machines have been installed and work will be started immediately. It is expected to begin making shipments in February. As a starter, an order for fifty cars has been booked with the newly organized McDuffee Automobile Company of Chicago.

HOUPT'S EMPTY STORE

Causes that Brought it About and Others that Induced Him to Enter Business.

To be the possessor of a large and handsome but absolutely bare salesroom is not at first blush exactly calculated to make a proprietor feel even fairly happy, yet it has that effect on Harry S. Houpt, who handles the Thomas line in this city. To a Motor World man on Monday he explained the matter.

"It is sort of aggravating to have not even a car to show customers," he said. "But what are you going to do when a man comes in and shakes the money at you—even forces it on you? You can't refuse him when he says that, while he had not intended to buy just now, if he could get this car on the floor he would take it, can you? Now, that is just the way it is with me. The last two cars have been whipped away from me in just such fashion, and here I am without a thing to show.

"I can't complain in the least, however. Since October 1, when I started in the automobile business, I have sold just nineteen Thomas cars. That isn't a bad beginning, is it? The only thing that is worrying me is not having enough cars to sell. My contract with the Thomas company calls for seventy-two cars. They will be sold before the 1905 season is well under way. The worst of it is that I am unable to get any more. I can't increase my order, for the company's output is sold—there are actual bona fide orders in hand for every car the factory can turn out, and no one can get a single car in addition to those already ordered."

Mr. Houpt is a striking illustration of the fascination the automobile possesses for men of energy and the impelling force it exercises on them. A figure of note in the metropolitan building trade, he purchased a Thomas car early last season. So much pleased was he with it that he conceived the idea of becoming interested in it, and entered into negotiation with the Buffalo concern to handle its goods in the metropolitan district. The venture was a success from the start, as Mr. Haupt's wide acquaintance among builders enabled him to interest them in the car, and after that sales were easy.

Death of Famous Drop Forger.

On Monday of this week James H. Williams, head of the big Brooklyn, N. Y., drop forge concern of J. H. Williams & Co., died at his residence in that city. He was fifty-nine years old, and leaves a wife, two sons and a daughter.

Until 1882 Mr. Williams was a member of the firm of Bliss & Williams, now E. W. Bliss & Co., makers of presses and dies. In 1884 he organized the firm of J. H. Williams & Co., whose extensive plant is in South Brooklyn. Automobile forgings are among their productions.

A Grand Prize

Has been awarded by the Juries of the Louisiana Purchase Exposition Co. to

THE GEORGE N. PIERCE CO.

On its exhibit of

Pierce Automobiles

In recognition of superior quality in workmanship and materials, together with correct engineering and design.

The PIERCE Line for 1905 will include

PIERCE Stanhope, 8 H.P. - - $1200

Great Arrow, 24-28 H.P., Side Entrance, $3500

Great Arrow, 28-32. " " " $4000

Dealers can secure this splendid line now for all unoccupied territory and correspondence to this end is solicited.

THE GEORGE N. PIERCE CO., Buffalo, N. Y.

Members of Association of Licensed Automobile Manufacturers.

WEIGHTS AND STRAINS

Steels that do not Best Serve the Purposes—Obstacles that are Being Removed.

Up to the present time builders of automobiles have confined the greater part of their attention to constructing a machine that would run well at all times and in any hands. This has now been accomplished, but entirely, or nearly so, in disregard of the kind of material that went into the machines and the weight of the machines.

It is for this reason that we find a given part of one machine twice as heavy as the same part of a similar machine.

It was noticeable at the last New York show that the vital parts of the French machines were not half as heavy to the eye as similar parts of American machines. There is a good reason for this. The foreigner has given much time and attention to putting the best of materials into the vital parts of his machine.

The weight of a machine, in proportion to the horsepower developed, is becoming more and more an important factor, and is likely to become the talking point with salesmen in the next year or two. Some manufacturers have already realized it, and are pushing this point very wisely.

On a level, the weight of the machine is not of such very vital importance, but the minute hill climbing begins, then every pound of weight counts seriously against the performance of the automobile. On the level a pound is carried along and increases the wheel and road friction but a very small amount. Going uphill it not only increases the running friction as it does on the level, but it takes just so many foot pounds of work to raise it up the hill.

The recent hill climbing contests showed this up very plainly. Unfortunately, it is not possible to give figures that will accurately demonstrate the point in hand, because the exact horsepower developed is not available. Enough is seen at a glance, however, in looking over the list of the competing machines to learn that the machine with the greatest horsepower per pound of vehicle was the winner, all other things being equal. It was noticeable, for example, that cars ordinarily sold as touring cars, with places for four, that were stripped down did far better than the same machines fully equipped as a touring car. It was extremely noticeable that the machines stripped to racing condition did far better than any others.

Of course, it will be said that this is to be expected, and so it is. The manufacturer must remember, however, that results along the same lines can be obtained by using the best of materials and cutting down the weight of the vital parts of the machine without injuring their strength.

There is too strong an idea among manufacturers that steel is steel, and that strong steel is brittle steel. It is hard for them to believe that high carbon steel and nickel steel and special alloys can be furnished by reliable manufacturers that will be two and three times as strong as anything they have used, and yet as tough, if not tougher, than anything they have used. As a matter of fact, it is not always the toughest steel that will stand the strains put upon it in automobile members the best. In fact, it has been demonstrated time and time again that soft steel, like .10 carbon, will not stand repeated shocks and strains as well as the higher carbons, which are not considered as tough.

The crank shaft is a part of the automobile that is called upon to resist alternate stresses under shock to a degree greater probably than any other part of the machine. If the bearings are tight and well adjusted the strains are bad enough; but the moment the crank pin bearings become worn and loose the punishment on the crank shaft is just about the same as though a lot of trip hammers were working at it. Only the very best of material, which has been brought into the best of condition by proper heat treatment, should be used in crank shaft forgings. Design is quite as important, even more so than material; but, assuming that the design is corect and has stood fairly well with the ordinary machine steel picked up in the market, then a crank shaft made from good steel properly treated ought to do three or four times as well and last indefinitely.

On the other hand, if a maker has had no trouble with his crank shaft, using ordinary machine steel, then it is perfectly certain that he can greatly reduce the weight of the crank shaft by the proper use of the steels to be found in the market with a little extra trouble.

There is one difficulty, or rather has been, in connection with a manufacturer obtaining special steels for special purposes. The large steel maker is inclined to turn up his nose at an order for a ton or two of crank shaft steel, or whatever else may be ordered. He may take it, however, and put it through the ordinary order books, and soon it is lost among a multitude of big orders. It may be sidetracked and forgotten, and then, when filled, the man who fills it may not have the slightest idea of what it is going into or of what importance it is, and he may care less. He will see that the order is only for a ton or two and may send any old thing.

Fortunately this condition of affairs is undergoing a change. The steel manufacturers are beginning to see that the automobile business in connection with pleasure vehicles is a big thing, and that the automobile in connection with business purposes is going to be a bigger thing.

It is now possible to get special steels with absolute certainty, and for the manufacturer to be assured that he will get what he asks for and that his order will receive personal attention by a man at the steel works who does nothing else.

Better yet, it is possible to get the special steels in a heat treated condition ready for machining.

It is wise to have the maker of the steel heat treat the forgings, because he has in his employ men who know all there is known of the art, and the best results can be obtained.

Forging companies, too, are going into the heat treatment of steel very intelligently. Only a few days ago tests were made showing an increase of elastic limit between the annealed and the heat treated steel of considerably over 100 per cent; at the same time the steel retained all its toughness and the grain of it was much finer. Fine grained steel is steel that is particularly suited to withstand repeated strains; the finer the grain the better.

This whole question of better materials must be worked to the limit by the manufacturer if he expects to get the best results, and, also, if he expects to get on top and stay there. HENRY SOUTHER.

The Week's Incorporations.

Detroit, Mich.—Rapid Motor Vehicle Co., under laws of Michigan, with $100,000 capital.

Binghampton, N. Y.—Troy Plate Battery Co., under laws of New York, with $50,000 capital. Directors—E. A. Beman, A. C. Rohe and G. C. Bayliss.

Brooklyn, N. Y.—Curtis Automobile Co., under New York laws, with $1,000 capital. Directors—Charles G. Curtis, Van Wyck Curtis and Alice W. Curtis.

Yonkers, N. Y.—Motor Supply Co., under New York laws, with $1,000 capital. Directors—David M. Harvey, William C. Dodge and P. F. W. Ruther.

Washington, D. C.—Cahill Automobile Co., under District of Columbia laws, with $5,000 capital. Corporators—Arthur E. H. Middleton, Frank S. Cahill and William S. Duvall.

Jamestown, N. Y.—Duquesne Construction Co., under New York laws, with $40,000 capital; to make automobiles. Directors—William J. Maddox, Brewer D. Phillips and Frank L. Bliss.

Dover, N. J.—Dover Garage Co., under New Jersey laws, with $10,000 capital; to manufacture and sell motor vehicles. Corporators—Robert A. Bennett, Charles E. Clark and Hiram P. Hall.

Newark, N. J.—H. O. S. Engineering Co., under New Jersey laws, with $25,000 capital; to manufacture and sell electric motors. Corporators—Ferdinand L. Crosley, Gilbert W. Roberts and Oscar Weiss.

Cleveland, Ohio.—D. E. Mars Electric Vehicle Co., under Ohio laws, with $2,500 capital. Corporators—W. O. De Mars, Charles W. Baker, John R. Beakesley, Jr., H. J. Gibbons and A. M. Barnes.

Los Angeles, Cal.—San Joaquin Valley and Coast Transportation Co., under California laws, with $100,000 capital, $5 subscribed; to operate lines of automobiles to transport passengers and baggage, and to maintain eating houses along the lines. Directors—A. D. Laughlin, I. H. Wilmans, T. Forster, Lucius C. Chase and M. Hopkins.

Duquesne Gets a Fresh Start.

Arrangements looking to a reorganization of the Duquesne Motor Car Company, of Jamestown, N. J., were entered into this week between LeRoy Pelletier, founder and president of the concern, and a number of business men of Jamestown, N. Y., and Corry and Erie, Pa. As a result the concern will be put on its feet, ample capital supplied and the work of constructing the Duquesne car vigorously prosecuted. As a preliminary, the Duquesne Construction Company has been incorporated with a capital of $40,000. and the Motor Car Company will be operated under this charter until a consolidation of the two concerns is effected. It is proposed that the latter company will then be converted into a motor boat and speed launch manufacturing company.

It is also stated that a contract has been made whereby the entire output of the company is purchased by one concern, the American Duquesne Company, composed of Akron, Cleveland, Indianapolis and New York men. The latter concern will act as distributing agents for all American and foreign territory.

The Duquesne is a side entrance tonneau touring car of 16-21 horse power propelled by a four-cylinder, air cooled gasoline engine.

Among the new stockholders are Frank L. Bliss, mayor of Corry, Pa.; W. J. Maddox, of the Maddox Table Co., Jamestown, who will take an active interest in the management; Brewer D. Phillips, president of the Bank of Jamestown; M. R. Stevenson, of the law firm of Wade & Stevenson; M. H. Clark, A. A. Amidon, Charles W. Herrick, George S. Bright, Thomas Crane, Charles J. Anderson, George O. Meredith, Charles J. Jenner, of Jamestown; Fred C. Leary, of New York; Seth Clover, of Erie, and Edward Heuer, manager of the Erie Brewing Company.

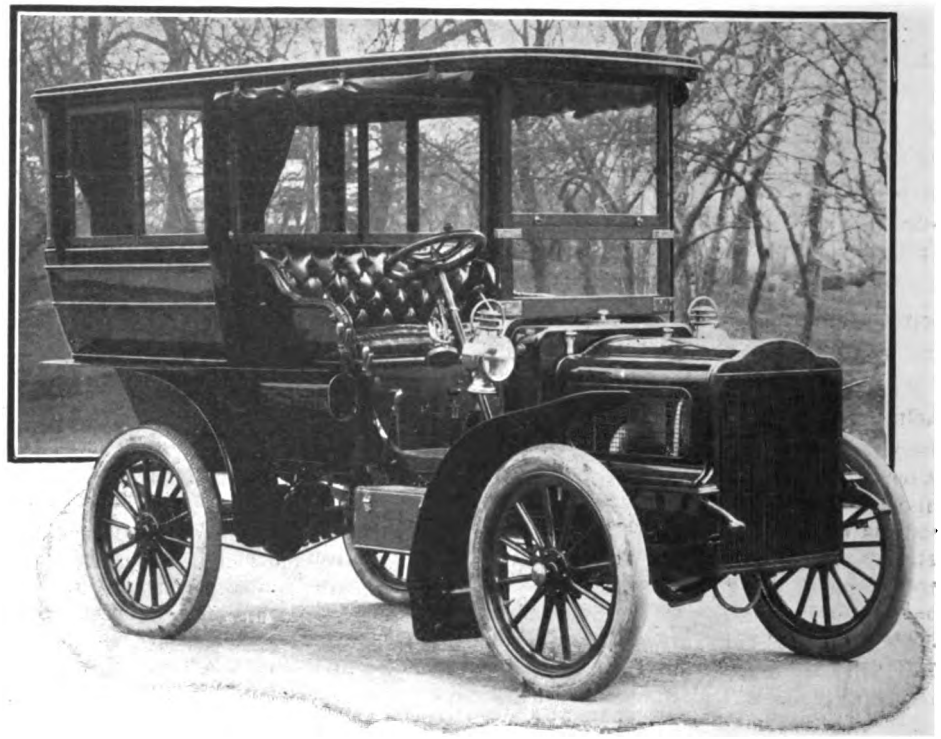
Thomas Tries His Six-Cylinder.

The first of the Thomas six-cylinder cars was completed last week and was given a road trial on Saturday. Although the roads were covered with snow and the ground was slipppery, it is stated that the speed indicator registered over sixty miles an hour on several occasions. This particular car will be shipped to Major C. J. S. Miller of Franklin, Pa., who will make his debut at the Ormond Beach Carnival in January, and who will also participate in several other race meets next year.

French Westinghouse Making Cars.

The Société Anonyme Westinghouse, under which title the French branch of the big Westinghouse company does business, has begun the manufacture of automobiles. A 28 horsepower gasolene car has been produced and has been favorably criticised.

Sampson to Build a Factory.



Property at Pittsfield, Mass., has been purchased by Alden Sampson, who proposes to erect thereon a factory to be used in building automobiles. When it is completed he will remove from his present location in the Robbins Shoe Co. Building.

Features of White's Limousine.

A recent addition to the 1905 White line is a Limousine model, shown by the accompanying illustration. The White branch, in this city, has received its first car of this type, and already has booked several orders for it.

With the exception of the body the car is a replica of the regular White 1905 touring car. Two styles of Limousine bodies are made, one permanent and the other removable. The former lists at $3,200 and the latter at $3,350, instead of the $2,500 charged for the standard touring car. The entrance to the rear portion of the Limousine is effected from the back, and the seats, which run lengthwise and facing each other, accommodate four persons. A storage battery under the seats supplies current for an incandescent electric lamp, which gives enough light to read by. A tiny clock, a mirror and various other toilet conveniences are disposed within easy reach.

The front of the car has a removable glass front, and the roof is extended to this glass, so that the driver and other occupants of the seats are fully protected also, except at the sides, which are open.

THE WHITE LIMOUSINE MODEL.

Branstetter Gets the Royal.

The Royal Motor Car Co. have placed their agency for Chicago with the Henry Branstetter Co., which will either build or rent a suitable garage and salesroom. It is certain, at any rate, that the building will be in keeping with the car, and that the sale of the latter will be pushed energetically.

The Fisher Special Manufacturing Company, Cincinnati, has finally taken possession of its new factory. It is a three-story brick building, 50 by 100 feet.

Premier to Have New Factory.

The Premier Motor Mfg. Co., is obtaining its full share of the prevailing prosperity. Evidence of it is rearing skyward at Indianapolis in the form of a new factory that will be ready for occupancy about January 1. This, with ample resources, due to the doubling of the company's capital stock, will render possible a substantially increased output for 1905, for which the demand is not lacking.

Diamond's New Battery Jar.

To their varied products the Diamond Rubber Co., Akron, Ohio, have added the Diamond soft cover battery jar, which is specially designed for use on automobiles. It is constructed with an ⅛-inch wall—3-32 of an inch hard rubber, and over this 1-32 of an inch soft rubber—with a view to easing any shock the jar may receive in handling or otherwise, and keeping the jar whole, even if the hard rubber should become cracked.

Shop Destroyed, Salesroom Saved.

Loss estimated at $3,000 was caused by a fire on the premises of the Curtis Machine Company at Elizabeth, N. J., last week. A lot of automobile parts and the contents of the repair shop were destroyed, but the concern's automobile salesroom was located in a detached building in the rear. This the firemen managed to save.

New Comer in Dayton.

The Dayton Automobile and Rubber Company has just opened a store in the Ohio city of that name. John Rock is president of the concern, and J. W. Brumbaugh manager. They will handle the Imperial car and carry a full line of tires, making the M. & W. their leader.

TO CURB THE CHAUFFEUR

The Proposed Law and How It Will Work—Precedent from Connecticut.

Among tradesmen who have given the subject thought there is a growing belief that the passage of a law making it a misdemeanor to use automobiles without the knowledge or consent of the owners is the most practical plan yet put forth to check the abuse that is prevalent wherever chauffeurs are employed. The New-York State Association of Automobile Clubs took the first step toward the attainment of this end a couple of weeks ago at its meeting in Syracuse, when it instructed its legislative committee to prepare such a bill for presentation to the legislature of this State. There is little doubt that a measure of this kind could be put through without any great trouble, so much wrought up is the public at the present time.

As it is now, the owner of a car is almost helpless in the matter. Practically his only recourse is to discharge the chauffeur; the alternative is to bring a civil suit against him for any damage he may have caused—a tedious and uncertain proceeding, with the almost certainty that nothing can be recovered even if the suit is won. Connecticut has a statute covering the misuse of horses, boats and bicycles, but making no mention of automobiles. The law in question is Section 1,232 of the Revised Statutes, which reads:

"Every person who shall wilfully take and use the horse, boat or bicycle or another, without his permission, shall be fined not more than fifty dollars, or imprisoned not more than three months, or both."

There is talk of having this amended so as to include automobiles, but no steps have yet been taken looking to this end.

"At least a year ago I advocated the passage of a State law making the unauthorized use of cars a misdemeanor—just such a law as the State association is preparing," said Manager Percy Owen of the Winton branch to a Motor World man on Monday. "Its passage would put a powerful weapon in the hands of owners, and make a beginning in the work of remedying the chauffeur evil. Until this is done, however, little can be accomplished. Chauffeurs can continue to use their owners' cars to take out parties of friends with impunity, knowing that the most that can be done to them if they are found out is to summarily discharge them. They simply take the chance of not being caught, and if they are they look around for another place and repeat the performance there."

Such a law as this would have the result of "putting it up" squarely to the owner and the garage people to abate, if not to stop utterly, the long list of abuses charged against the chauffeur. With it they could, if they would, inflict summary punishment on any chauffeur who indulged in these illicit practices, and it would act as a deterrant infinitely more powerful than any punitive measures than can now be applied.

Olds's Prices Remain Unchanged.

There will be no changes in the price of Oldsmobiles for 1905. Speculation on that point was set at rest this week, when the Olds Motor Works announced its figures as follows:

7 horsepower standard runabout, $650; 7 horsepower touring runabout, $750; 10 horsepower light tonneau, $950; 20 horsepower touring car, $1,400; 10 horsepower light delivery car, $1,000; 16 horsepower heavy delivery car, $2,000.

The 20 horsepower model is the newest addition to the line. It is the long expected two-cylinder tourney car. It will have a side entrance tonneau and Olds quality will be "all there."

The standard runabout is fitted with a new carburetor, which has increased its power and pace very markedly.

One of the yet unlisted vehicles, a ten passenger car, which will be ready probably in January is a sign of the times and will meet the demand of the scores of stage route promotors, that hitherto, has gone almost unheeded.

Peerless Placed in Philadelphia.

The Peerless agency for Philadelphia, recently relinquished by Banker Bros., has been secured by the Eastern Automobile Co., a new concern, which has just been organized, with temporary offices at 712 Girard Trust Building. The incorporators are: N. E. Brigham, A. B. Cumner, George T. Thompson, H. K. Buck and J. R. Maynes. Mr. Cumner will be the active manager of the concern.

In addition to the Peerless, they will also handle the Stevens-Duryea, and will take on another car to complete their line. They expect to operate a fully equipped garage and salesroom, but are not yet ready to announce the location.

Lear to Handle His Own Car.

The Oscar Lear Automobile Co., Columbus, Ohio, have relinquished the agencies they held during the past year, and during 1905 they will market a car of their own, the Freyer-Mueller, as it will be styled. About fifty of them will be built. They will be of the four-cylinder air-cooled type, the engine being fitted with a blower in front, connected by an aluminum pipe to four aluminum jackets around the cylinders. By this means, air is blown directly on each cylinder.

Lozier Sails for Paris.

H. A. Lozier, president of the Lozier Motor Co., sailed for France on Wednesday morning. He will attend the Paris show and is expected to return to this country about January 4. The Lozier Motor Co. expects to build three or four cars a week for next year's trade. So far as can be learned, they have not yet selected a location for their New York salesroom.

LIGHT ON CHAUFFEUR'S WAYS

Causes that Give Rise to Midnight Carousals and Accidents—Where Responsibility Rests.

Wonder is often expresed that the "hacking" of cars, the wild midnight rides and all the other evidences of chauffeur malfeasance is permitted to go on brazenly and almost openly, month after month without any real, or at any rate, any effective effort to stamp them out. Do the garage keepers or their employes "stand in" with the chauffeurs, or are they simply lax in their methods? Do owners know or care what their chauffeurs do with their expensive cars out of hours? These were some of the questions put to a number of tradesmen by a Motor World man this week, and the replies shed a remarkable amount of light on the matter.

"It is not easy to give a categorical answer to these questions," said one man, whose concern has one of the largest establishments in the city. "You must remember that the automobile industry is a new one and is suffering from abuses and inconsistencies that are liable to affect a business presenting so many and complex problems of does this. At present the responsibility for the chauffeur evil is a divided one. There are three classes sharing the blame for the existence of the prevailing conditions which have done more to bring opprobrium upon the automobile than all other causes combined. There is the garage keeper pure and simple, the dealer who runs a garage as an appendage to his salesroom, the owner of the car, all to be considered. Each has his own special viewpoint and the interests of the three are diverse and frequently contradictory.

"Take our own case first. Our business is to sell cars. The garage is merely incidental and was instituted and is maintained partly because we have the room and the facilities and partly because it is deemed good business policy to run an establishment where our customers can store their cars and have them properly looked after. Naturally, therefore, our interests are identical with those of our customers and there is no reason why we should truckle to our chauffeurs or permit them to put the cars in their charge 'on the bum,' as the very expressive phrase goes in the chauffeur's jargon.

"Now, we have about 100 cars regularly stored with us, all of them our own make. We have a separate storage department, with a superintendent who looks after that end of the business exclusively. Our system for keeping track of cars is very thorough. A record of every car is kept, the time of its out going and incoming, and who has it in charge on each occasion. In nearly every case the owner authorizes his chauffeur to get his car on demand; that is, he is not

Digitized by Google

required to have a written or telephonic order.

"When it is requested we send any customer a weekly report, giving in detail the record of his car. But we do this only when it is asked for. We find that most owners are disposed to be easy, even generous with their chauffeurs. If the car is always in when they want it, and is kept in good running order, they seldom ask any questions. Some of them have the utmost confidence in their chauffeurs, and a few even permit them to use the car for their own pleasure; but this is exceptional. Most of them are careless or indisposed to keep too tight a rein on their employes, and the latter have things pretty much their own way.

"There is a better class of chauffeurs in the employ of our customers than is usual, for most of them are recommended by us and are steady, reliable men. Of course, there are exceptions; but we make it a point, for our own protection, to see that our cars are well taken care of, and that necessarily means that the best men obtainable are employed for the purpose. As a result, there is very little 'hacking' of cars, or abuse of any sort. Furthermore, this is a matter that our customers and ourselves can control absolutely if the former will put the power into our hands."

Views of much the same character were expressed by the branch manager of a large Western concern. He went even further in pointing to the car owner as the one best able to put a stop to the abuses referred to; provided, of course, that he stores with a concern not dependent for its chief revenue upon its storage business.

"We keep 'tab' on every car that leaves or enters our garage," he said. "A copy of the record is sent to the car owner every week, whether he asks for it or not. We even go beyond this in our anxiety to prevent the illicit use of cars. If we have reason to believe that a chauffeur is using a car without the owner's knowledge we give the latter a hint. A case of this kind happened not long ago, and I was surprised to be told by the owner that he did not care whether his chauffeur used the car or not. Of course, we could not do anything after that. It was the first time, however, that I ever saw such indifference displayed. A great many of our patrons pay scant attention to our weekly reports, I suspect, but the fact that we send them helps to keep the men under control. Then, too, they know that we won't permit any abuse of the cars to go on under our noses and they govern themselves accordingly.

"All garages are not as strict as this, however. The other evening I had been to the theatre, and on my way out I saw, on a side street a car belonging to a friend. The chauffeur was not in his seat, so I stopped and looked around to see where he was. Presently I saw him waiting at the stage entrance. I stopped in a near by refreshment establishment and came out just in time to see Mr. Chauffeur loading up the car with a party of chorus girls. You may imagine the kind of a lark they had.

"The next day I saw my friend and made a casual remark about his having been out in his car the night before. As I expected, he denied it. Then I told him that his car was out and he was very much surprised.

"'Don't you get a report from your garage, showing when the car is taken out?' I asked. He replied that he did not, and that he was not even aware whether any record was kept.."

It is with the garages run as a separate business, or with a salesroom "on the side," however, that the chauffeur evil flourishes like the green bay tree. There the garage keeper, if he does not actually "stand in" with the chauffeur and wink at or even encourage his transgressions, is at least from the very nature of his position, obliged to keep the chauffeur in a good humor. The chauffeur has the car of his master and can usually store the car where he pleases; this, of course, is where he receives the "best treatment." "Good treatment" consists of a regular commission, usually 10 per cent, on all cars stored and a similar "rake off" on all accessories purchased and all repairs made. The people in such establishments are very reticent, and when they will talk at all they are guarded in their statements.

"There is no use dening that commissions are paid," said one of these in reply to the question. "But they are not as general nor as large as is commonly supposed. But we have to get trade and where it is necessary we do not haggle about a few dollars more or less. Nor can we afford to antagonize a chauffeur if he wants to have a little amusement with his employer's car when the latter does not want to use it. We aim to treat both owner and chauffeur right and I guess we succeed pretty well or we would have these cars—" and he pointed to a long line of vehicles, many of them high powered and costly cars.

While it will not do to condemn all garages of this kind, as a number of them do as close to a legitimate business as the circumstances will permit, it is undeniable that many of them are in crying need of reform. But here, too, no reform is possible without the co-operation of the owners. If they are careless and indifferent their chauffeurs are unbeatable. No garage keeper can make headway against them, no matter how desirous he is of doing so, without the backing of the owners. With them enlisted, any garage keeper can win out, while it is doubtful whether a combination of garage keepers and chauffeurs could ultimately win out against the determined owner, for there is a class of garageman who wants to do right and will if he has half a chance. One tradesman voiced this view of the matter when he said:

"Nothing would please me better than to conduct a garage on right principles. There would be no nonsense about it, no commissions, no bounses, no divies, no swelling of bills to give the chauffeur his share of the loot, no 'hacking' of cars. The service would be prompt and business like, the cars kept in order and always ready for service and the chauffeurs kept in check at all times. I'll venture to say such treatment would appeal not only to owners, but to the decenter chauffeur also. As it is now it is a case of graft all the way through. Why, it is common talk in the street that one millionaire owner paid $1,600 to have his car put in order for one race, and $800 more to have it repaired after the race; and it didn't win, then. The owner, so they say, paid the bill without a murmur! Do you wonder that chauffeuring is a profitable business?"

Why Gilson Wears Smiles.

En route to Detroit, J. W. Gilson, secretary of the Hartford Rubber Works Co., stopped over in New York for a few hours on Wednesday. Gilson is all smiles these days, and the fashion in which the Dunlop perfected detachable tire has "caught on" quite justifies the smile. It has been adopted as regular equipment by the Electric Vehicle Co., the Cadillac Automobile Co. and the Reo Motor Car Co., while Thos. B. Jeffrey & Co. will list it as one of three tires which they will furnish on their Ramblers in 1905. The factory at Hartford has been working nights for the last month to keep pace with the demand ,and has now attained an output of 100 sets per day. When Gilson was asked if the success of the tire had not surprised him, he looked hurt.

"Surprised?" he responded. "Why should I be? We knew the tire was a sure winner from the very start."

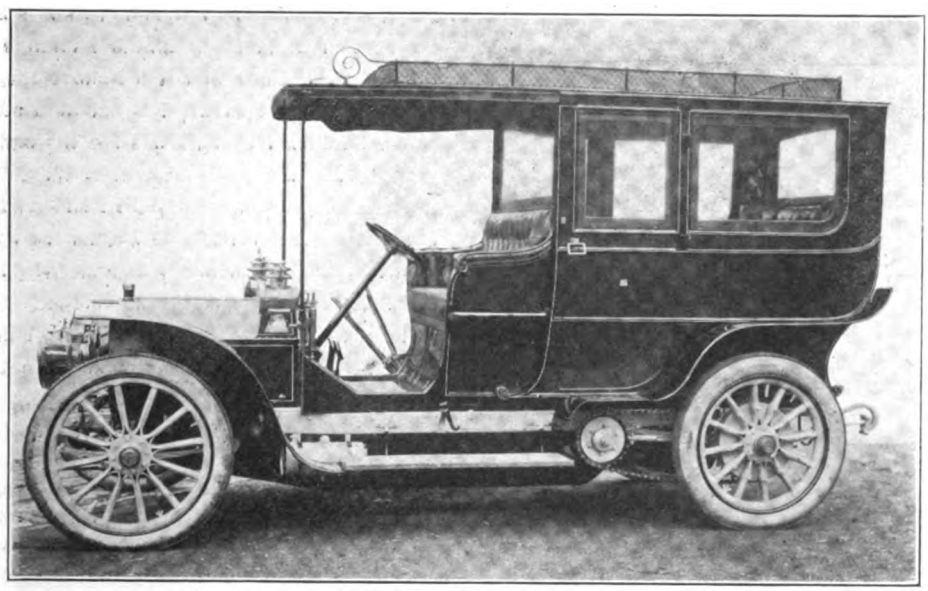
How Electric Cabs Have Expanded.

In retiring from the presidency of the New York Transportation Co. last week Henry Sanderson let fall some facts and figures which show vividly the onward march of the electric cab in New York.

"Five years ago," he said, "the company's total station capacity was 72,000 square feet, and the company's vehicles, in the course of a year, covered 350,000 miles. To-day the combined floor area of the company's four stations aggregates 222,000 square feet—over five acres—and those stations house over five hundred vehicles, which in the course of a year reached the tremendous total distance covered of 2,000,000 miles."

Mr. Sanderson's retirement was made the occasion of the presentation of a testimonial in the form of a handsome desk set of Tiffany bronze, and engrossed and framed resolutions. He is succeeded by R. W. Meade.

Packard Adds Another Story.



There is nothing the mattter with the Packard. Although the Packard Motor Car Co. recently installed some $30,000 worth of additional machinery and operated their plant until 9 p. m. throughout November, the pressure has required an addition to the factory at Detroit. The work on this was started last week and takes the form of a second floor addition to the north wing of the building. The enlargement provides a floor, 326 feet by 60 feet, or 19,650 square feet. It will be used chiefly for the painting and upholstering work.

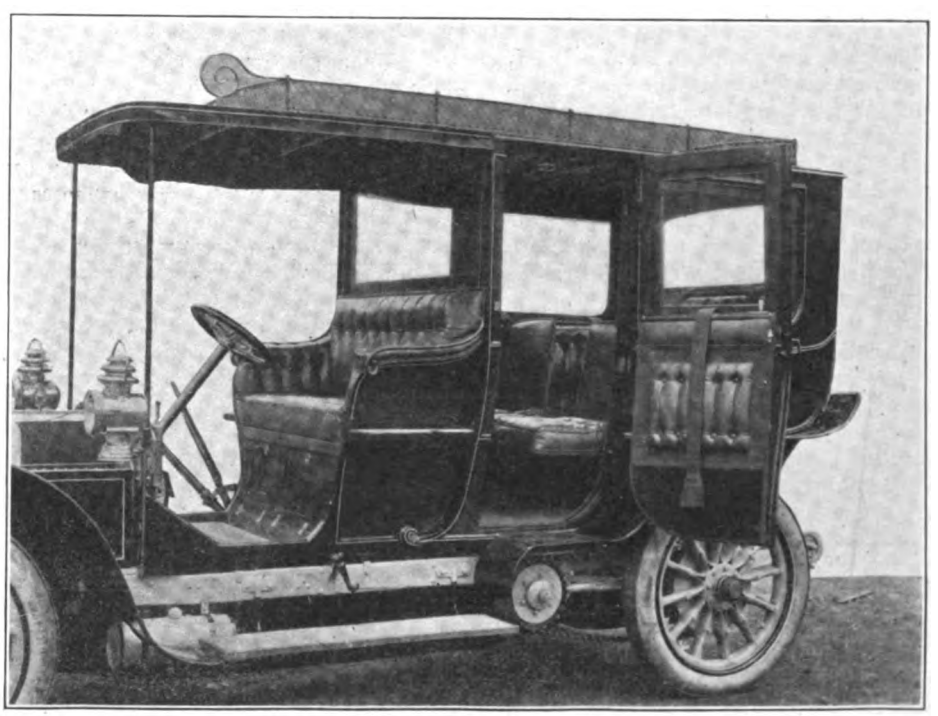
OF EXCLUSIVE DESIGN

Wealthy Motorist's Idea of a Touring Car—Its Many Novel Conveniences.

M. Theodore Kearney, who passed through New-York this week en route from Paris to his California estate, between which points he shuttles annually, shipped ahead of him



an uncommonly interesting car—one fairly bristling with features, and representing the owner's idea of what a touring car should be. It combines all of the latter day devices that contribute to comfort, and, in addition, a limousine body, designed by Mr. Kearney himself and built by Hooper & Co., of London, after all of the notable French body manufacturers had refused to accept Mr. Kearney's order.

The limousine, which is imposed on a 45 horsepower Mercedes chasis, has practically no overhang and no wide flaring sweeps or bulging sides, all of which Mr. Kearney sought to avoid, and successfully. One other idea he kept in mind was a touring car having a closed body, which might yet be made as open, or practically as open, as the tonneau type. This he contrived to do by the use of not merely large sliding windows on front, back and sides, but also by the employment of shutters. It is believed to be the first occasion on which these latter have been used. The glass is made to slide down in the body of the car, instead of swinging sideways or being suspended to the roof; the Kearney design permits them to be dropped out of sight, and, if running at high speed, the shutters, which also slide down alongside the glass, may be raised in the rear and on half of the sides to keep out the dust.

The car is provided with seats for four persons inside, all facing forward. The two in front are moveable, and when not required may be folded and stowed under the rear seat.

The rear seats are upholstered in shape like the best railway carriages in France, with seats sloping backward, so as to throw the weight of the body on the back, and are exceedingly comfortable. Three electric lights are placed inside, also large pockets to hold touring maps and books. There is a timepiece, also one of Smith & Son's new speedometers, which constantly indicates the speed of the car at all times, records the run for the day and shows the total miles run by the car since going into commission,

whether it be 1,000 or 20,000 miles. A further convenience is one of Muhlbacher's electric indicators, by which, on pressing the proper button, the indicator on the dashboard gives the chauffeur the following signals: Left, Right, Turn, Go on, Stop, Slower, Faster, House, etc.

The chassis being a 1904 Mercedes, has unusually long springs, which makes for easy riding, but, in addition to this, the new Hartford-Truffault springs, or shock absorbers, have been added. The tires are Michelin, the rear ones having the Samson non-skid covers.

Of the minor changes in the car may be mentioned the luggage rail, which runs the full length of the top, so that the weight of the extra tires and four large suit cases carried there in touring may be evenly distributed, and not centred over the rear wheels. Of the two forward lamps, one has a powerful lens, to project the light a long distance up the road, and the other is designed to light up the road near the car.

The chassis is painted a warm cream color, with black stripes, and the whole body of the car to the room is a rich blue, with the panels and windows outlined in black stripes and light blue stripes laid on top of these. The result of all is a very neat and artistic car of graceful lines, that is much admired by those who have seen it, and one that, being quite "up to date," must prove very satisfactory to the fortunate owner.

The first annual banquet of the Newton (Mass.) Automobile Club on Saturday last was graced by the presence of several notables, among them H. W. Whipple, president of the A. A. A.; Elliot C. Lee, president of the Massachusetts Automobile Club, and Alexander Winton, of Cleveland, and Harry Fosdick, of the Winton staff. In all seventy persons participated in the feast. Messrs. Whipple, Lee and Fosdick were among the speakers. Fosdick said he had knowledge that even more restrictive legislation would be attempted at the next session of the Massachusetts Legislature, and urged automobilists to get together and prepare to make a stand for self-protection.

M. G. Chauffour, a Parisian banker, is, appropriately enough, an ardent motorist.

WHIPPLE IS RENOMINATED

Will Again Lead the A. A. A.—Few Changes in Present Slate to be Made.

Harlan W. Whipple will be president of the American Automobile Association for another year. He was not particularly anxious to serve another term, but was prevailed upon to allow his name to be placed at the head of the ticket again. All of the other present officers were also renominated at the meeting of the Board of Directors, held last Tuesday at the rooms of the Automobile Club of America. Several changes were made in the Board of Directors. An important amendment to the constitution was proposed. In place of electing seven directors, it is planned to give every affiliated club, with a membership of fifty or more, representation on the board, but confining a quorum to four, as at present. It was also decided to include the second and third vice-presidents in the Board of Directors and to change the meeting dates from the first Tuesday to the first Monday in the month.

The complete ticket follows: President, Harlan W. Whipple, Andover, Mass.; first vice-president, John Farson, Chicago; second vice-president, W. H. Hotchkiss, Buffalo; third vice-president, M. Johnson, Los Angeles, Cal.; treasurer, G. E. Farrington, Orange, N. J., and secretary, C. H. Gillette, New York. The directors named are D. H. Morris, W. C. Temple, Elliott C. Lee, Windsor T. White, A. R. Pardington, R. L. Lippitt and C. G. Burgoyne. W. E. Milbank, B. H. Warburton and J. A. Chase are the directors who will retire.

The meeting was presided over by President Whipple, and those in attendance were Elliott C. Lee, Boston; W. T. White, Cleveland; Dr. W. E. Milbank, Albany; G. E. Farrington, Automobile Club of New Jersey; S. H. Valentine, New York, and A. R. Pardington, Brooklyn. A. T. Post and Emerson Brooks were also present. Five clubs were elected to membership at the meeting, these being the Geneva, Binghamton, Chenango County, Houston and Dallas organizations. There are now forty-one clubs affiliated with the A. A. A., while last year at this time there were but sixteen. The annual meeting will be held in New York City on January 16, and the annual banquet will follow.

New Britain Club in Shape.

At a meeting held last Thursday night, the Automobile Club of New Britain (Conn.) adopted a constitution and by-laws. The objects of the club are to promote the intelligent use of motor vehicles for pleasure and for commercial purposes; to promote the social intercourse of the members; to protect the interests of automobile and motor bicycle owners; to influence improvements through the proper officials in the main roads surrounding New Britain; to co-operate with the authorities in maintaining legal speed by motor vehicles passing through cities and towns and to maintain signs along the main roads wherever parties touring through that section of the country will be benefited. The following committees were appointed: On membership, F. H. Allis, F. S. Neal, of Plainville; runs and tours, A. W. Stanley, D. E. Bradley, of Berlin; M. S. Hart; on legislation, W. H. Caldwell, G. E. Sage, of Berlin; E. Allen Moore; on good roads, E. G. Babcock, E. A. Freeman, of Forestville; W. W. Mildrum, of East Berlin; on rights and privileges, P. P. Wilcox, E. W. Abbe, E. A. Bardol. The club will endeavor to have a law passed requiring lights on all vehicles.

How the Kentucky Colonel Got There.

Colonel Bennett H. Young and Frank Parfitt, the city inspector of electric wires, made a record-breaking automobile trip between Louisville and Lexington, Ky., one day last week. The distance of ninety-six miles was covered in three hours and forty-five minutes. The start was made from Louisville at 5 a. m. and they reached Lexington at 8:45 o'clock.

Colonel Young had an imporant case in the court at Lexington, but missed his train, which leaves at 3:30 a. m. He tried to charter a special train, but was unable to effect arrangements. Parfitt is Colonel Young's neighbor, and owns a Rambler automobile, and came to the rescue. He agreed to take the Colonel, and they started in a heavy fog, which was not lifted until nearly 8 o'clock. At times during the trip, it is naively remarked, Colonel Young wished that he had not engaged Mr. Parfitt, so rapid was the pace of the machine, but when they reached their destination fifteen minutes before court convened Colonel Young was delighted.

Lone Entry for Bennett Cup.

Although entries for the 1905 race for the Bennett cup close on Thursday next, but one American entry is in sight, that of Dr. Harold E. Thomas, the Chicago enthusiast, who has had a Locomobile racer built to his order. The entry is practically assured, but cannot be formally accepted or announced until Dr. Thomas is elected a member of the Automobile Club of America.

Two Changes in A. C. A.

Pressure of business has obliged Samuel H. Valentine, the newly elected treasurer of the A. C. A., to tender his resignation, and the vacancy was filled last week by the election of Emerson Brooks. Retiring President W. E. Scarritt was elected to the vacancy on the board of governors caused by the elevation of President Morris.

Harvard Student Goes to Florida.

A. H. Diston, a student of Harvard University, intends to make an early start for Ormond so as to be present at the races there. He will ship his car, a Packard, to Philadelphia this week from Cambridge and will drive it over the roads from the Quaker City to Florida.

FOR FLORIDA'S CARNIVAL

Changes Effected that Make for Permanent Success—Philadelphian Becomes President.

Although it has not been officially decided and heaven and earth are being moved in the effort to prevent it (for the sake of hotel receipts) it is quite possible that the races over Ormond-Daytona beach will finish at Daytona instead of at Ormond, as has been the custom heretofore. Another change for the better, and one that will remove the impression that the carnival is one-man affair, is the likelihood that entries for the coming meet in January will be received by J. B. Parkinson, secretary of the Florida East Coast Auto Association, at Daytona, as well as with the "unselfish" manager in New York City. To be sure, these changes are bitterly opposed by the Ormond hotel keepers, who inaugurated a most reckless expenditure of money for telegraphing to everyone they knew in Florida as soon as they heard about the plans. One thing is certain and that is the fact that an undertaking of the magnitude and international aspect of the Ormond-Daytona Carnival should not much longer continue to be a mere anex of a hotel, no matter how large and magnificient the hostelry may be. It should be understood that the hotels are practically all that there is of Ormond, while Daytona is quite a smart little town.

Additional evidence that the "one-man" regime has passed, and that the carnival will cease to be a hotel annex, developed late on Wednesday, when it was announced that C. G. Burgoyne, of Daytona, Fla., had resigned the presidency of the Florida East Coast Automobile Association and been succeeded by Edward M. Steck, of Philadelphia. Mr. Steck is a millionaire coal operator and a racing enthusiast. He is half owner of the big Darracq racer which recently was imported, and was one of those who took a firm stand in insisting that the Florida carnival be thrown open to the world and not used to satisfy the personal grudges of any one man. Mr. Steck recently purchased a residence at Daytona.

Baras Gets Kilometer Record.

Another cut in the flying kilometre record was made at Ostend, Belgium, on November 14. Baras, on a 100-horsepower Darracq, was the record breaker, he covering the distance in 21 2-5 seconds, beating the previous best time, that made by Rigolly, by the narrow margin of one-fifth of a second.

First Entry for Glidden Trophy.

The first entry in the inaugural competition for the Glidden touring trophy is reported from England. The entrant is Roger H. Fuller, a member of the Automobile Club of Great Britain and Ireland.

THE TEST THAT FAILED

How a Series of Attempts to Destroy a Car Came to Naught.

Following the custom inaugurated in 1903, when the first four cylinder Packard was produced, the Packard Motor Car Company have been putting their Model N car through a course of sprouts. A "destructive test" is the apt designation of the series of ordeals through which the car was put, and that it turned out to be an utter failure, in so far as the endeavor to destroy the car or any essential part of it, is cause for congratulation instead of lamentation. The car came through all the tests with flying colors, and it would be a futile task to attempt to convince any of the 'crews' who participated in the harrowing tests that any reasonable amount of usage—either fair or unfair—can detrimentally affect the Model N Packard.

AN INCIDENT OF THE TEST—A PUNCTURE REPAIRED IN 12 MINUTES.

The first of the tests was conducted in the mountains of Pennsylvania. The new car was shipped to New-York and driven from there to Philadelphia, and up into the mountains around Scranton and Wilkesbarre, where it was subjected to terrible abuse. During its stay it lowered the record on the Wilkesbarre mountain from 14 minutes to 8 minutes. It performed in many other ways to the satisfaction of General Manager Joy and Vice-President Alger, who personally conducted the test.

The second attempt to find a weak spot in the car was made by Charles Schmidt, the Packard designer, and was aimed at the motor alone. There were brake tests at speeds ranging from 400 up to and including 2,500 revolutions per minute. In this test it was not the idea that any user of the Packard car would ever expect his motor to run at speeds approaching 2,000, to say nothing of 2,500 per minute, but the testers desired to satisfy themselves that the motor itself had enough margin of safety to meet every requirement of the rational motorist.

The third test was made by Messrs. H. B. Joy, S. D. Waldon, L. W. Conkling and E. W. Roberts, with a brand new car, and consisted of a 250 mile run over as bad roads as exist in the country, at as high a rate of speed as was possible, considering the safety of the passengers and proper respect for the rights of other users of the roads. It was the idea in this trip to if possible break or injure the running gear and springs, if such abuse would accomplish it. The car completed this test in perfect shape, with the exception of a Cape Cart top, with which the car was fitted, which, though closed up and strapped down to the body, received such shocks as to break every one of the steel bows holding it to the body.

The final test was made with a standard model "N" Packard car just as it came from the erecting shop, with the exception that prior to starting the journey the four connecting rods were loosened up so that each one had sufficient play (about 1-125 of an inch) to produce quite a noticeable pound. The car was then started from the factory at 5 o'clock on the morning of November 19, and driven as hard as the safety of the operators and the conditions of traffic would permit through to Chicago, arriving there—313¼ miles—at 9 o'clock the same night. It was the idea that by putting through this test with the connecting rods loose and pounding at every revolution of the motor any deficiency in the factor of safety in any of the important parts of the motor would be revealed by the continued hammering, and that any weak spot that would not ordinarily come out to notice, except after many times the same amount of driving in the hands of ordinary users, and probably not until the middle of the season, would be at once detected. With the return journey to Detroit, the run represents an average of over twenty-one miles an hour running time, as it was completed in 32½ hours elapsed and 29 hours and 20 minutes elapsed time. There was a noticeable improvement in the action of the motor during the last 200 miles over what it had been during the first 200. In spite of the looseness of the connecting rods, they seem to be working quite freely, and apparently did not absorb enough power to make any apparent reduction in the speed of the car.

Chloride to Prevent Freezing.

Until now it has been difficult for motorists to obtain chloride of calcium for use as an anti-freezing mixture for water cooled cars, owing to the fact that it was usually sold only in large quantities. The demand for it has so increased, however, that the Solvay Process Co., of Syracuse, N. Y., is now putting it up in two gallon cans, which are carried in stock in New York, Chicago, Boston, Pittsburg and Baltimore. The Carbondale Chemical Co., Carbondale, Pa., are the general selling agents.

The chloride is put up in the form of a concentrated solution of 1.400 specific gravity, containing 40 per cent of anhydrous calcium chloride; this, when diluted with an equal volume of water, gives a 20 per cent solution of 1.200 specific gravity, which will withstand a temperature of 9 degrees below zero Fahr., without freezing, while its boiling point is 220 degrees Fahr.

The solution is water white and clear, and is free from sediment; it is neutral or slightly alkaline in its reaction; it is not decomposed by heat. It is practically chemically pure, free from chloride of sodium or salt and from chloride of magnesium.

By varying the amount of water added, a solution of any desired strength may be had, according to the following table:

Specific gravity.	Freezing point.
1.250	—32.6°F
1.225	—18.0
1.200	— 9.0
1.175	Zero
1.150	+ 7.5
1.125	+ 13.0
1.100	+ 18.0

The solution retails for 50 cents per gallon.

Darracq Earns a Half Million.

One French concern that has made a great deal of money during the past year is the Darracq Co. Its report and balance sheet for the year ending September 30, 1904, show a net profit of over $562,000, and this is arrived at after writing off depreciation, commisisons and all charges at the French works and the London depot. After paying 6 per cent on the preference shares and 62½ cents per share on the ordinary shares, $250,000 will be set aside for increase of works and machinery, and $175,000 carried forward. The capital of the company is $1,875,000.

TO OPEN BEAR CREEK ROAD

Motorist Brings Suit Against Turnpike Company, which Files an Amusing Answer.

To issue an order prohibiting automobiles from using a public road is one thing, but to give a legal reason for the order is quite another. The Laurel Run Turnpike Co., which owns the Bear Creek Boulevard, near Wilkesbarre, Penn., provided one horn of a dilemma for itself by trying to keep automobilists off the road, as was told recently in The Motor World. Charles E. Bertels, a motorist of Wilkesbarre, imagined that he had as much right on the road as other citizens who drove horse drawn vehicles, and he has provided the other horn of the dilemma for the company by bringing suit against it for the prohibition. He asked for a mandamus to compel the company to allow him to drive over the road, alleging that he was not allowed to use the road, even after he had offered to pay toll for the privilege. Some very unusual reasons are given for the prohibition in the company's answer to Mr. Bertels's suit. Part of the answer is as follows:

"The said automobile did not come into use until about the year 1898, and are now in use by very few people in comparison with the great number who use vehicles drawn by horses.

"The said automobile, by reason of their size, great speed, rivalling the velocity of railway trains, and alarming noise, are extremely dangerous to the travelling public, and their use on public highways is fraught with great danger to travellers who drive horses.

"The said turnpike was designed and constructed expressly for the convenience and pleasure of people in driving with horses over the same, and by reason of grades, high embankments and numerous curves and passage of automobiles over the same would be such a menace as to exclude vehicles drawn by horses, and give to automobiles a complete monopoly of its use.

"In our judgment, safety to the general public pre-emptorily demands the exclusion of automobiles from our turnpike, and for this reason we refuse passage thereof over the same.

"Not only does the law fail to provide any toll whatever, but it would be impossible to provide any reasonably adequate toll for automobiles over turnpikes by reason of their character above mentioned.

"Furthermore, we say that between the terminals of said turnpike, to wit, between Wilkesbarre and Bear Creek there already exists, and for many years has existed, a public road much shorter and more direct than our turnpike, and affording to the petitioner every facility for passage with his automobile."

To Prosecute Wisconsin Motorphobes.

Members of the Milwaukee (Wisconsin) Automobile Club intend to put a stop to the attempts of farmers to injure machines and tires, and will prosecute all offenders in the future. It is claimed that broken glass and pieces of barbed wire are scattered on the roads and that rails and logs are used as blockades at night. F. C. Beach, a member of the club, recently had both of the rear tires on his machine punctured by a man who shot at them with a rifle. The club's president, the Rev. J. F. Szukalski, told of one occasion when he found a road blocked with logs in such a way that wagons could pass without injury, but an automobile would be badly damaged. It is also said that automobilists have been compelled to stop at the point of guns while farmers drove mockingly past them. No attempt will be made to prosecute past offenders, but in the future prosecution will follow whenever evidence can be obtained against the offenders.

Shanley "Does the Honors."

B. M. Shanley, jr., tendered the officials of the recent meet of the New Jersey Automobile and Motor Club a mushroom dinner at Maison Pedeflous's hotel, near Plainfield, last week, as a celebration over the success of the meet. The party went in four large cars, Mr. Shanley leading in his ninety horsepower Mercedes, and the affair was one of the most enjoyable at which motorists in the vicinity have gathered. In the party were President Frederick R. Pratt, of the New Jersey Automobile and Motor Club; Dr. James R. English, its vice-president; C. S. Wells, the secretary; W. C. Shanley, Peter G. Murray, J. W. Mason, J. H. Wood, R. H. Burtt, J. V. Clark, James M. Reilly, J. J. O'Connor, jr., W. V. Snyder, R. T. Newton and J. H. Dawson.

Green a Genuine Enthusiast.

Colonel E. H. R. Green, president of the Texas Midland Railroad, is said to have the only private railroad car in the world devoted to the use of automobiles. His private car "Lone Star" was recently damaged by fire, and he had it rebuilt to carry his racing automobile. He has three or four machines which he races at contests in different parts of Texas, and the private car has been fitted up with a repair shop. A repair man accompanies the machines on their travels. The car is fitted with an arrangement to facilitate the loading and unloading of the automobiles.

Oppressive Measures Likely in Maine.

It is regarded as almost certain that the Maine legislature will, at its session this winter, discuss automobile legislation. A bill was before the body last winter, but failed of passage. It is rumored that the new bill will contain a clause restricting the use of automobiles to certain hours, and the motorists of the State are already preparing to fight the measure if it contains anything so outrageous.

THEY WANT THE WHOLE ROAD

Gentle Country Folk Will Petition Connecticut Legislature to Prohibit Use of Automobiles.

In Litchfield County, on the extreme western edge of Connecticut, the farmers and countryfolk generally are very much aroused—so thoroughly aroused, indeed, that the more hotheaded are actually circulating a petition to the legislature praying that automobiles be prohibited the use of the public roads.

George S. Thompson, of Kent, appears to be one of the leaders in the movement. The burden of his argument is that the roads are narrow. Apparently unconscious of what it implies, he state, in other language, that the countryfolk driving horses want all of the road themselves. He admits, also, that, like countryfolk, there are automobilists, who are considerate, exactly as there are "young nabob," as he calls them, who are inconsiderate.

He and his neighbors in Litchfield County, however, appear to desire that both innocent and the guilty shall be swept off the roads entirely.

"Let the autos have their own road like railroads," he pleads, in a public statement.

Although he admits that there is small chance of the legislature heeding the petition, he thinks that perhaps sufficient sentiment may be aroused throughout the state to "have something come of it." The petition is as follows:

To the Honorable Senate and House of Representatives, State of Connecticut:—

We, whose names are herein signed, are citizens of Connecticut and town of Kent of the age of 21 years and over, and we petition your body that an act may be passed prohibiting automobiles or vehicles, whose motive power is steam, gasolene or electricity from use of country roads of this State on the grounds that country highways being generally narrow with many sudden curves and dangerous places, and from the extreme liability of automobiles to frighten horses are unfit courses of travel for such; and being a pleasure vehicle of a comparative few, render the roads unsafe for the many, who must of necessity, travel the roads. And, we believe laws regulating speed or making owners of automobiles liable for damages are, and will be difficult of enforcement in country districts. We, therefore, pray they may be prohibited from travel on country roads of this State.

Coffee grounds are said to be efficacious in aiding the removal of oil and grease stains from the hands. A motorist who has tried it gives this method of application:

Obtain a good lather with any household or other soap, and taking a handful of coffee grounds proceed to work it well into the hands. After a minute or so the hands, when rinsed free of the gritty mixture, will be found to be beautifully soft, fresh and clean.

MILWAUKEE'S MOTOR TRUCK

Incorporates Some Ingenious Features—What They are and How They are Worked Out.

The first truck of the Four Wheel Drive Wagon Co. of Milwaukee, has been practically completed, and from the best reports is giving a good account of itself. It is shown by the accompanying illustration.

The truck weighs 2 tons, and is capable of carrying 5 tons. The frame is of ship channel iron 5-16 inches thick and 6 inches deep, made in one piece 42 feet long and joined at the rear. It is mounted on steel

MILWAUKEE FOUR WHEEL DRIVE WAGON.

axles, weighing 350 pounds each, by platform springs of large size. The wheels constitute a new departure, being made of wedge-shaped wooden blocks set solid in hub flanges, and reinforced by retaining rings on each side, set 1½ inches from periphery, which tend to prevent slipping of the blocks and aid in crossing tracks and other obstructions. No tires are used, the wooden blocks acting in this capacity. They fill with gravel, stones, etc., from the road surface, become rough and hard, and cannot slip.

Each wheel is pivoted in center of hub, which is 11 inches outside and 7½ inches inside diameter. Any wheel pivot may have the pin removed, or any two wheels may be so treated, yet the wheels, it is claimed, will always track perfectly. Each wheel is driven from a central point by chains. The central transmission wheel is directly connected to engine by chains.

In spite of the contrary appearance there is no loss of power from the six chains. No more difficulty is experienced in turning the whole mechanism against the compression of the engine than in turning the engine alone against its compression. All the driving mechanism can be moved by a pull of one hand on the main chain. Each wheel has a band brake, which is equally efficient forward or back. There is a total brake surface of 500 square inches. There is no chance of dead load as each wheel drives direct.

The engine is a 40-50 horsepower four-cylinder water-cooled, mounted crosswise in front and enclosed in a six-foot cab for the engineer. Control is like that used on street cars, circular, and so arranged that it automatically locks wherever placed. The driver's seat will be over engine. Radiator will be at one end, and water tank at the other end of engine, and valves placed in pipes so that water can be cut off from radiator easily. Water pipes will be run around engine, and the whole be enclosed in hood and under the seat of the cab, which will leave little chance for freezing in any weather. A fan will also be so attached to radiator and so arranged that it can be used at will.

The speed of the car with 5 ton load, high gear, will be 10 miles; intermediate, 6; low, 2½. On low gear the engine transmits at ratio of 48 to 1.

The completed trucks will be sold at prices considerably lower than the prevailing quotations of $1,000 per ton capacity. This 5 ton truck will bring $3,000. Other sizes will also be built. Deliveries will be made February 1.

Syracuse Hotel to Use Automobiles.

Four Columbia electric vehicles have been purchased by the proprietors of a big hotel in Syracuse, and will be put into commission about the first of the year. Two of them are 'buses to carry passengers, and the others are wagons to haul baggage. The passenger vehicles will be made like opera 'buses, and will seat ten passengers each.

Will Follow the American Plan.

A heavy vehicle competition is to be promoted next year by the Automobile Club of Marseilles, France. The plan of turning over the competing cars to be operated for two weeks by a carrying company, as was done in the commercial vehicle test of the A. C. A., last spring, is to be followed.

Always look at both sides of a punctured inner tube, to ascertain whether the puncturing object has penetrated the under as well as the upper portion of the tube, and thus perhaps save a second dismantling of the tire.

INDIA A GOOD MARKET

But Cost of Gasolene Requires that Cars be Equipped with Special Carburetters.

"To the English maker of cars India is a very far-away place. Doubtless; but in a half-hearted kind of way he tries to get a footing in the Indian market. But the impression his spasmodic effort leaves on the mind of the average Indian motorist is that the English car maker is too busy supplying the needs of the home country, and too insularly ignorant in regard to Indian conditions, to make a businesslike bid for the Indian trade," says F. J. E. Spring, in the Motor Car Journal.

"The consequence is that French and American cars are cutting him out; and, just as the French have already pretty well captured the car trade in the Federated Malay States, where the De Dion-Bouton reigns supreme, so they and the Oldsmobile and Locomobile people will get a real footing in India if English makers do not soon realize the position.

"What we users of cars in India have chiefly to complain of is that the makers of internal combustion engines will insist on forcing on us an engine with a carburetter suited only to the use of petrol. Now India is a biggish place, just about the size of all Europe, including the British Isles, with Russia cut off. It is a country of rich men of the native land owning class, and of fairly well-off English officials, who, as a class, are sportsmen, and would like to use motor cars, as well as their stables full of horses, if only the makers would take the trouble to learn the local conditions and supply what is required. What is wanted will be understood from the following:

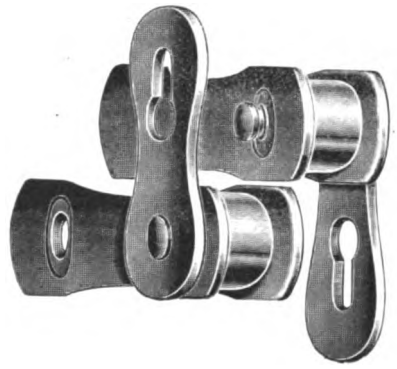
"The temperature inside an iron covered goods wagon during several months of the year may run as high, for some hours of each day, throughout great tracts of India as large as France and Germany, as 150 degrees F. Similarly, in the towns, or in private houses, where petrol is likely to be stored, the temperature may run up, for like periods, to anything between 105 degrees and 125 degrees. Now, these are not very nice temperatures for petrol, and the consequence is that the Government, who practically own the 27,000 miles of Indian railways, and who, moreover, are responsible for the public safety in general, whether on the railways or elsewhere, find it necessary to place such onerous restrictions on the carriage of petrol that, except in a few large towns, the motor car owner is practically unable to replenish his tank.

"At this moment a conference of all the railway managers of India is sitting in conclave, and one of the subjects under consideration is the possibility of permitting consignments of ten gallons of petrol to be dispatched by passenger trains. At present the motorist can only carry two gallons at a time.

Digitized by Google

and he must be himself a traveller in the same train. In other words, as a convenience to motorists travelling by train, they are allowed to be accompanied by a two-gallon tin of petrol. If they want any further supply it must be sent ahead of them by goods train, and in this country of magnificent distances that may mean that it must be arranged for weeks ahead. Now there is not the smallest use in the stay-at-home British maker of cars thinking to himself, 'This is all wrong, it ought to be altered.' Doubtless it ought, but it will not be altered to suit his convenience. Meanwhile he is losing his trade to Americans and others, who, instead of saying, 'The conditions of a country of three hundred millions of people must be altered because my drummer has not put me up to the tip to meet those conditions,' say, 'How can I adapt myself to the conditions of the country?"

"I have explainedw hat these conditions are as regards petrol. There is no trouble, except the cost of it, two to three shillings a gallon, in certain great cities; but throughout the rest of this vast country there simply is not any petrol, and there is not going to be any, whatever the British car maker may think. Then he will doubtless ask, 'What is there to take its place?' There is paraffin oil to take its place—kerosene we call it—in unlimited quantities. There is probably not a petty hamlet of half a dozen huts along the roads of India, throughout the length and breadth of the land, where kerosene cannot be bought. Not high-flashing oil that is only burned in rich people's houses, but low-flashing Russian, or Burma, or Borneo oil, say 120 degrees flash point, most if it imported in bulk and run all over India in bulk oil cars, to be stored in tanks near the railway stations for sale to the villagers either in bulk or re-canned.



"But the English car maker will insist on putting carburetters on his cars, chiefly of the float type, which do not permit of kerosene being used. We owners of cars are curious to know why he does this. Is it his insularity? or is it cussedness? or is it the intensely British idea, 'Take my goods or leave them?" For the last month an American Oldsmobile has been running about Madras, some twenty to thirty miles daily, on common kerosene (paraffin) oil. The carburetter, not a float one, serves equally well for petrol and for kerosene when once warmed up. Therefore, the owner starts his car for about one hundred yards on petrol and then changes over to kerosene. While patrol here—in a seaport where it is comparatively cheap—costs 3s., kerosene costs only 6d. per gallon. Therefore, if, as appears to be the case, both do the same mileage per gallon, the saving on 6,000 miles in a year, at thirty-six miles to a gollon, will be about £20 in a year, or enough to provide the owner of the Oldsmobile with a new set of tires annually.

"But the saving in cost is a trifle compared with the car's ability to take its owner practically everywhere, throughout the length and breadth of India."

Improvements in Baldwin Chains.

The Baldwin Chain & Mfg. Co., Worcester, Mass., are offering for the 1905 season two practically new chains, one of their well-known detachable type, the other of the riveted variety; both are shown by the accompanying illustrations.

The detachable chain is now made so that

the links cannot become detached by accident or breakage. It has less parts than the original Baldwin detachable chain. Each stud is riveted at one end on alternate sides. The links, however, cannot slide together when in use. The smaller cut shows the shape the chain must assume in order that the links may be detached.

The extension of the ends of the links of

the riveted chain and their rounded edges constitute features, the extended ends in both the riveted and detachable chain tending to limit the side movement of the chain when in use. The longer the chain is run the greater the tendency for lateral sway of the chain, and this is largely limited in both forms of the chain by the extended form of the side links. This also makes the space of the sprocket tooth in each link the same width. The nicely rounded edges help the chain to easily find its place on the sprocket. This is desirable from the fact that many users of cars, especially novices, are careless in maintaining the alignment of their sprockets, and when they are thus out of line the sprocket tooth strikes against the square edges and ends of the links of the chains as they have been heretofore made, producing friction in running. By the use of the rounded edges, there are no square corners for the sprocket teeth to strike. The chain is assisted as much as possible to its place on the sprocket, and it helps in the direction of quiet running.

For a Bee Line to Black Hills.

Though it is but 160 miles in a straight line from Chamberlain or Pierre, South Dakota, to Rapid City in the Black Hills, it is necessary to make a railroad journey of a thousand miles to get there. Since the settlement of South Dakota, no railroad lines have been built from the Eastern part of the State to the Black Hills. Residents of the district who wish to visit the Black Hills must go to Sioux City, Iowa, or Omaha, Neb., and travel westward through Northern Nebraska.

To remedy this Joseph Moore, a wealthy stockman, who lives in western South Dakota, proposes to establish an automobile line between Pierre and Rapid City. He will run the machines over the straightest and best road he can find betwen the Missouri River and the Black Hills, and thinks the distance can be covered in ten hours. Although there are some rough roads between the two points, Moore thinks the automobile line will be a success, as the r. ads will be passable most of the time on account of the light rainfall.

Symptoms of Progress in Russia.

An automobile factory is to be started in Kieff, Russia. It is claimed that it will be the first of the kind in the empire of the Czar, and that some influential capitalists are back of the prospective concern. It is further stated that the government, in order to encourage the local enterprise and have the example imitated, will increase the tax on foreign automobiles and alter the custom regulations to that effect.

May Banish the Horse.

Automobile busses are offered by the Paris Automobile Co. as substitutes for all of its horse drawn vehicles. The company has made experiments with automobiles and finds that steam machines will do their work cheaper than horses. If granted abolition of transfers at the way stations it will establish the new service within one year and reduce passenger fares.

Will Use Two Trucks in Hartford.

Manager Evans of the Hartford, Conn., trolley express has ordered two 20-horse-power trucks of the Knox Automobile Co. for use in Hartford; they will be employed for delivering goods carried by trolley. The automobiles have a carrying capacity of one and one-half tons.

Good Road to Atlantic City.

The prospect of a good road for automobiles all the way from Jersey City to Atlantic City, N. J., running along the coast, is the pleasing probability presented to motorists for next summer. Ocean County has completed fifteen miles of improved stone road along the shore, and it is the main highway from Tom's River to Tuckerton.

The contract has been awarded for the completion of the main road to the borders of Atlantic County, and when what is finished before the middle of next summer, it will make a continuous good road from Jersey City to Atlantic City. The route will be through the Amboys, across the new bridge, over to the coast and thence to Lakewood, Tom's River and Tuckerton and into Atlantic City. There will not be a poor piece of road on the whole route.

Motorphobia in Bryan's Country.

According to a dispatch from Lincoln, the farmers of the northern part of Nebraska are preparing to fight automobilists. There are many good roads in that section of the State, and the automobile travel is quite heavy. The farmers have pledged some of the State legislators from that section to introduce a drastic bill in the legislature to regulate automobiles. It will be intended to keep self propelled machines from the roads altogether unless run at a very low speed, and they must stop at the side of the road as soon as a horse drawn vehicle comes in sight. Motorists are preparing to fight the proposed legislation, and will ask for equal privileges with teams.

State Law is Superior.

City Solicitor Baker, of Cleveland, Ohio, has given an adverse opinion on the long pending Maulberger automobile ordinance. It seeks to limit speed to seven miles an hour, whereas the State law fixes the speed limit at eight miles an hour.

Boston's Generous Park Commission!

In addition to the parkways which the Metropolitan Park Commissioners of Boston opened for the use of automobilists some time ago, the commission has recently decided to open the Revere Beach boulevard during a part of the year. The automobilists may now use this fine stretch of road from the 1st of October until May 15, but not at other times. This makes the boulevard available for the automobilists during the fall months which are among the pleasantest for driving, and also in the early spring months and during the winter. It was thought best to still keep the machines from the boulevard when the crowds are greatest.

Before granting the privilege the board conferred with Revere residents, and none of them found objection to the automobilists using the road from the 1st of October until May 15, but not at other times. That they have this fine shore road practically all to themselves during the winter does not mean that they have any other unusual privileges. They will be governed by the same ten miles an hour speed limit that prevails on the parkways that are open all the year round. The Revere Beach Parkway gives access to the beach boulevard from Everett and Chelsea.

The Wager that Foley Must Pay.

An automobile figures in a novel wager made between John T. Foley, of Omaha, Neb., and Senator Patrick Sullivan, of Casper, Wyo., the former being the loser. The conditions were that the loser should buy an automobile and deliver it in person to the winner at his home. Foley must drive the automobile the entire distance of 700 miles himself and deliver it not later than January 1. He cannot water or provision on the trip, but must depend on finding a place to eat and sleep on the way. As the journey is through long stretches of sand and sagebrush, and over rough mountain roads, the loser has quite a task before him.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—1904 White Touring Car with top, gas lamps and side baskets. Car guaranteed first class shape; $1450.00. Reason for selling—buying 1905 Model "White." Address T. W. J. SUITE, 28 Manhattan Blk., Cleveland, Ohio.

WANTED—Fifteen to twenty traveling salesmen by a well-known and established tire manufacturing company, making standard goods. Only active men who know how to work effectively and all the time need apply. Exceptional opportunity for men of the right sort. Address, TIRES, P. O. Box 649, New York.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

SALESMAN.

A machine salesman, age 30, with 7 years' experience, 3 years with automobiles, desires position. Address E. N. B., care MOTOR WORLD.

FOR SALE—16-H. P. four-ton Panhard Levassor Delivery Truck in perfect running order; a splendid machine at a bargain. FAIRMOUNT ENGINEERING WORKS, 2652 Callowhill St., Philadelphia, Pa.

WANTED—1904 Packard or will trade in 1904 Haynes-Apperson (Runabout). Address M. S., 41 Abington Ave., Newark, N. J.

FOR SALE—Winton quad. In best condition, with four hundred dollars worth of extras on it. Very best reason for selling. It will pay you to investigate, if you are comtemplating buying an automobile at a bargain. Address Room 403, First National Bank Building, Danville, Ill.

Every Dog Has His Day!

THIS IS THE TIME TO

BUY YOUR SUPPLIES.

Lamps, Horns, Pumps, Goggles, Plugs, Batteries, Odometers, Jacks, Coils, Baskets, Tires, Chains, etc.

EVERYTHING FOR AUTOMOBILE OWNERS AND DEALERS.

EXCELSIOR SUPPLY CO., - 233-5-7 Randolph Street, Chicago, Ill.

GOODRICH TIRES

last through a season of hard racing and still in good condition.
Other tires on the same tracks were barely good enough for one heat.
Racing tires must be of the strongest construction. All GOODRICH tires are racing tires.

The B. F. Goodrich Co., Los Angeles, Cal. Oct.6,1904.

Akron, O.

Dear Sirs:-

I am indeed glad to place myself on record as an ardent advocate of your Goodrich Clincher Tire with which I have had four years experience in direct competition with other makes of tires and I truly believe them to be absolutely the best clincher tire on the American market today.

I used a set of Goodrich tires which had been put on my machine at San Francisco in November 1903 and which tires I used for three days hard racing at Ingleside where the car won its first race over Barney Oldfield; it was then shipped to Los Angeles and did two days hard racing here giving Oldfield a hard chase for his money on two occasions; the same car was used nearly every Saturday during the summer and then shipped to Del Monte where it raced two days fast racing winning the two open events with every mile better than 1.04; it was then shipped again to Los Angeles and I can truly say that these tires are still in good condition and ready for more fast work at the coming meet Oct.21st. These tires have never once had a pump put on them after being fitted to the rims at San Francisco last year. All other makes of tires were repeatedly replaced between races and heats at Del Monte; at least six times on one particular car where four different makes of tires were used, none of which I am glad to say were Goodrich.

Yours very truly,

WHITE GARAGE

H. D. Ryus

The Week's Patents.

775,765. Vehicle Train. Charles Renard, Meudon, France. Filed January 7, 1904. Serial No. 188,064. (No model.)

Claim—1. A train of driving and driven vehicles, the driving vehicle carrying a motor, a shaft extending longitudinally of the train, operable by said motor, and means operated by the shaft for actuating the driving wheels of the driven vehicle or vehicles independently of each other.

775,819. Explosive Engine. Charles Hibbard and Warren Hibbard, Sandyhill, N. Y., assignors of one-third to Sumner Hibbard, Sandyhill, N. Y. Filed November 30, 1903. Serial No. 183,212. (No model.)

Claim—1. An explosion engine comprising a working cylinder having a radial admission port for the explosive mixture, and a boss closed at its inner end projecting inwardly from the rear end of the cylinder having an annular space around it for the circulation of the explosive gases and which is shaped to receive the explosive mixture from the admission port and to retard its passage toward the exhaust port of the cylinder.

775,860. Means for Cooling Heated Surfaces. James H. Sager and George D. Green, Rochester, N. Y., assignors, by direct and mesne assignments, to Regas Automobile Co., Rochester, N. Y., a corporation of New York. Filed October 14, 1902. Serial No. 127,273. (No model.)

Claim—1. The combination, with a heated body, of tubes projecting therefrom, each tube having one end fastened to said heated body and transverse perforations through the walls of said tube between the ends.

775,871. Variable Air Gap Condenser. Frederick F. Strong, Boston, Mass. Filed May 23, 1904. Serial No. 209,299. (No model.)

Claim—1. The herein described apparatus, comprising means for producing a current of excessively high frequency, an applying electrode, and a convective discharge means, in series therewith between said electrode and said producing means for interposing in the current a convective spray discharge, thereby modifying the current for therapeutic work.

775,872. Rotary Spark Gap. Frederick F. Strong, Boston, Mass. Filed May 23, 1904. Serial No. 209,300. (No model.)

Claim—1. A device of the kind described, comprising a fixed disruptive charge electrode, a rotary electrode co-operating therewith, and arc producing means in series therewith located adjacent said electrodes.

775,908. Speed Regulator for Explosive Engines. John S. Losch, Pottsville, Pa. Filed May 28, 1902. Serial No. 109,283. (No model.)

Claim—1. In an explosive engine having a fuel supply conduit and an admission port, a rocking valve stem having an arm, and a valve on said arm adapted to be moved to and from the admission port to control admission of fuel, said valve being normally held closed, and a governor adapted to act on said arm to open the valve.

775,932. Sparking Ignitor Device for Hydrocarbon Engines. James W. Packard, Warren, Ohio, assignor to Packard Motor Car Company, Warren, Ohio, a Corporation of West Virginia. Filed June 27, 1903. Serial No. 163,351. (No model.)

Claim.—1. An igniting device for hydrocarbon engines comprising, in combination, a sparking circuit, a rotating shaft, a governor device on said shaft, a disk of insulating material arranged transversely of the shaft, a contact plate carried by said disk, and a contact point carried by the governor device and arranged to travel over said disk and contact plate, said disk having a portion of insulating material extending radially outward from said contact plate whereby the ignition is discontinued when the speed exceeds a given limit.

775,941. Transmission Gear for Automobiles. Walter Simkins, London, England. Filed May 16, 1904. Serial No. 208,256. (No model.)

Claim.—1. In combination, a drive shaft, a chain sprocket attached thereto, a road driving wheel, a pulley attached to said driving wheel, a ring of teeth adapted to slip slightly on said pulley and a chain transmitting the power from the sprocket on said drive shaft to the teeth on said pulley, substantially as set forth.

775,999. Automobile Headlight Cover. Harry S. Tompkins, Newark, N. J. Filed Feb. 8, 1904. Serial No. 192,579. (No model.)

Claim.—1. The herein described cover for automobile headlights comprising a back piece and a top piece meeting at the highest point of the cover, a circular front, and side pieces each arranged with its front, top and rear edges joined to the first mentioned parts and at its lower edge overlaping the lower edge of the other.

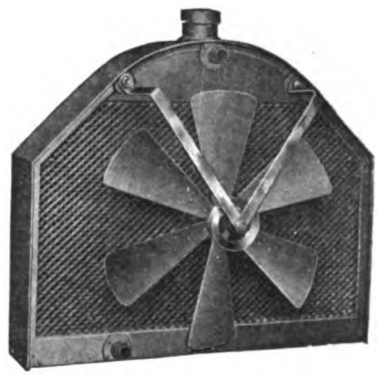
776,023. Motor and Frame Therefor for Motor Vehicle. Norman T. Harrington, Detroit, Mich., assignor to Olds Motor Works, Detroit, Mich., a Corporation of Michigan. Filed March 21, 1904. Serial No. 199,245. (No model.)

Claim.—1. The combination with a crank shaft of a casing therefor, having an opening therein for the passage of the crank and entering slots in its opposite walls for the reception of the crank shaft, filling blocks for closing said entering slots and a cap for closing said opening.

776,028. Speed Governor. Homer N. Motsinger, Pendleton, Ind., assignor to Motsinger Device Manufacturing Company, Pendleton, Ind., a Corporation of Indiana. Filed Sept. 21, 1903. Serial No. 174,044. (No model.)

Claim.—1. In a speed governor, the combination with an electric generator, of a pawl and ratchet mechanism for driving the same, an electromagnet adapted to separate said pawl and ratchet mechanism, and electric connection between the generator and the magnet, for the purpose set forth.

776,035. Tire. Walter C. Stokes, New York, N. Y. Filed Aug. 27, 1904. Serial No. 222,385. (No model.)



Claim.—1. In a tire having an inner resilient portion and an outer tread portion, the combination of means between said portions to prevent the pucturing of the inner resilient portion and bolts extending through said means and the outer tread portion upon each side of the centre of the outer tread portion, and nuts upon the outer ends of the bolts, for the purpose set forth.

776,047. Tire Rim. Charles G. Fawkes, Denver, Col. Filed Jan. 15, 1904. Serial No. 189,214. (No model.)

Claim.—1. The combination with a cushion tire having a cavity, of a shoe located in said cavity, a duplex rim having engaging interlocking parts located adjacent the inner periphery of the tire, and a fastening device having a threaded connection with the shoe

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builders have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of cool- is worth something to our customers.

We are now shipping coolers on our 1905 orders.

THE WHITLOCK COIL PIPE COMPANY

HARTFORD, - CONNECTICUT.

and passing through the interlocking rim members as well as the inner periphery of the tire.

776,078. Running Gear for Vehicle. John F. Murphy, Jackson, Mich. Filed Jan. 15, 1904. Serial No. 189,189. (No model.)

Claim.—1. In a running gear for vehicles, the combination with a body, and wheel supporting means, of means for causing the body and wheels to synchronously tilt in the same direction.

776,118. Speed Regulator for Explosion Engines. Michael H. Daley, Charles City, Iowa. Filed Sept. 30, 1903. Serial No. 175,218. (No model.)

Claim.—1. In a gas engine, an explosion chamber, an adjustable head for varying the volume of the chamber, means for adjusting the head, an inlet valve, a valve operating mechanism including a rocking lever and a revoluble member for engagement with the lever, and means connecting the adjusting mechanism of the head to the rocking lever thereby to alter the position of the latter to an extent proportionate to the degree of adjustment of the head.

776,220. Controller for Electrical Vehicles. Henry H. Cutler, Milwaukee, Wis., assignor to the Cutler-Hammer Manufacturing Company, Milwaukee, Wis., a Corporation of Wisconsin. Filed April 15, 1903. Serial No. 152,701. (No model.)

Claim.—1. The combination with a suitable controlling circuit, of a plurality of electromagnetic windings connected therewith and adapted to respond to variation of voltage, and means for varying at will the voltage impressed upon said controlling circuit without thereby altering the resistance of said controlling circuit.

776,366. Tire Inflating Pump. Samuel E. Spencer, Springville, N. Y., assignor of one-half to Ralph B. Waite, Springville, N. Y. Filed May 2, 1904. Serial No. 205,936. (No model.)

Claim.—1. A tire inflating pump mechanism comprising a starting crank designed to be removably engaged with the driving shaft of the motor, the crank pin mounted to rotate in the crank, a crank arm on said crank pin, a pump cylinder mounted on the first named crank, and a piston in said cylinder having connection with the crank arm.

776,406. Vaporizer for Hydrocarbon Engines. Elden P. Lamb, Rockland, Me., assignor to Camden Anchor-Rockland Machine Company, Rockland, Me. Filed Nov. 23, 1903. Serial No. 182,375. (No model.)

Claim.—1. In a vaporizer for internal combustion engines, the combination with the mixing chamber and the liquid feed regulator, of an inlet nozzle in said mixing chamber, radially arranged air inlets in said mixing chamber above and below said nozzle, means for opening and closing said air inlets and a deflector between said upper and lower inlets, substantially as described.

776,480. Protective Coating for Storage Battery Plates. Achille Meygret, Paris, France. Original application filed June 29, 1903. Serial No. 163,637. Divided and this application filed July 27, 1903. Renewed April 6, 1904. Serial No. 201,915. (No specimens.)

Claim.—1. A protective coating or covering for storage battery plates or electrodes, consisting of an envelope or sheath formed by dipping the plate or electrode, with the active material thereon, into a solution of tetrabutyrat of cellulose, substantially as described.

VOLIER HORNS.

Volier Horns

The VOLIER DRAGON: Double turns not only add to the beauty of the horn but by providing a longer vibration chamber or sounding board, produce a deep, swelling, powerful tone.

No other horn enjoys the high reputation that the **VOLIER** has earned. The non-corrosive reeds and the chemically cured bulbs have proved such superior features as to make the VOLIER the standard for motor car equipment. About 80 per cent. of all the cars made this year were equipped with VOLIERS.

MA SAYS SHE LIKES MORGAN & WRIGHT CLINCHER TIRES BETTER THAN THE OTHER KINDS BECAUSE THEY'VE MADE DAD'S LANGUAGE MORE LADYLIKE

HARLAN BROS.,
St. Louis.

MESSRS. MORGAN & WRIGHT, Chicago.

Gentlemen—After four months' testing of your Clincher tires on a St Louis Motor Car, I am convinced that **they stand without a peer.** I have not suffered the slightest inconvenience in any respect during this time,—a fact that is the more remarkable in view of some very rough usage which the tires have received. You may rest assured that I will strongly recommend them when opportunity affords.

Yours very truly, EDWARD E. HARLAN.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

GOODRICH TIRES

last through a season of hard racing and still in good condition.
Other tires on the same tracks were barely good enough for one heat.
Racing tires must be of the strongest construction. All GOODRICH tires are racing tires.

The B. F. Goodrich Co.,
Akron, O.

LOS ANGELES, CAL. Oct.6,1904.

Dear Sirs:-

I am indeed glad to place myself on record as an ardent advocate of your Goodrich Clincher Tire with which I have had four years experience in direct competition with other makes of tires and I truly believe them to be absolutely the best clincher tire on the American market today.

I used a set of Goodrich tires which had been put on my machine at San Francisco in November 1903 and which tires I used for three days hard racing at Ingleside where the car won its first race over Barney Oldfield; it was then shipped to Los Angeles and did two days hard racing here giving Oldfield a hard chase for his money on two occasions; the same car was used nearly every Saturday during the summer and then shipped to Del Monte where it raced two days fast racing winning the two open events with every mile better than 1.04; it was then shipped again to Los Angeles and I can truly say that these tires are still in good condition and ready for more fast work at the coming meet Oct.21st. These tires have never once had a pump put on them after being fitted to the rims at San Francisco last year. All other makes of tires were repeatedly replaced between races and heats at Del Monte; at least six times on one particular car where four different makes of tires were used, none of which I am glad to say were Goodrich.

Yours very truly,

WHITE GARAGE

THE RECORD OF THE FORD.

Victory after victory is credited to the Ford light racing car. When you consider that this car gets its power from two of our standard type horizontal motors, you must admit it is proof positive of the correctness of the Ford design and construction for speed, strength and power. The Ford cars have established a record in every day use of consistent reliability and unvarying satisfaction.

MODEL B. Price, $2000.00. Henry Ford's Latest and Greatest Success.

A striking example of the distinctive Ford construction. Weight 1710 lbs. Four-cylinder vertical motor developing over 20-horsepower. This gives our car more power for its weight than any car of equal price in the world. Consequently there is less wear on the tires and ample reserve power for steep grades and sandy roads. Wheel base 92 inches, direct drive with universal coupling, cylinders 4x5 water cooled; automatic oiling devices with force feed, large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car places this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horsepower, planetary transmission, chain drive, and increased gasoline capacity. The most stylish low-priced car on the market.

SOME GOOD TERRITORY YET FOR LIVE AGENTS. WRITE US TO-DAY FOR FULL INFORMATION.

The ELMORE

THE CHOICE OF THE MAN WHO THINKS.

The choice of the man who "puts 2 and 2 together" and realizes the uselessness of using four strokes when two accomplish the same service more satisfactorily and naturally with less wear and tear on the car.

Think it over yourself and then let us mail you our literature. It's uncommonly interesting and instructive.

ELMORE MFG. CO., Clyde, Ohio.

RIM LIFE

means

TIRE LIFE.

"SWEDOH" Spring Steel Rims

are long-lived.

Their use insures long-life to the tires to which they are fitted.

The composition of "SWEDOH" SPRING STEEL is peculiarly adapted to automobile rim building. There's just the right proportion of toughness to keep the rims round and just enough spring to soften the shocks to which a rim is subjected.

"SWEDOH" SPRING STEEL RIMS are now used by most builders of high-class cars, and are heartily indorsed by all tire manufacturers.

Made by

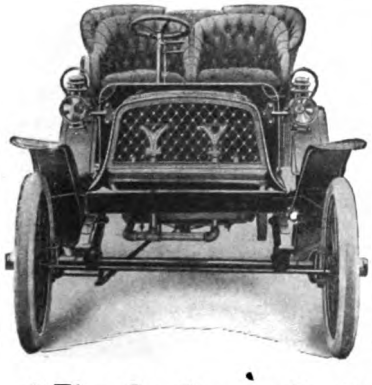
MAXWELL POINTS

are bound to appeal to you on account of their extreme practical value to the average American automobilist.

The small number of parts in "Maxwell" constructions and the absolute simplicity of each part places these two cars in a class by themselves. If you want an automobile that is to be depended upon—one in which there is "nothing to do but ride" and which is a stranger to the repair shop, then get posted as to the "Maxwell." It is the car for *you.*



NO PUMP. NO CHAIN. Double opposed motor in front under the hood and easily accessible in every part. Transmission case and crank shaft cast in one piece of aluminum. Noiseless, smooth and strong.

Agencies for 1905 are now being placed.

MAXWELL-BRISCOE MOTOR COMPANY, - Tarrytown, N. Y.

PREMIER

AIR COOLED DIRECT RADIATION

The car for the agent to handle because it makes sales. The car for the driver to buy because it is pleasing in appearance, roomy, light per horse power, embodying only the most up-to-date mechanical ideas and highest grade of workmanship.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This handsomely bound and artistically printed book contains 83 pages and illustrates 76 gasolene cars, one car and its specifications to each page. It is issued primarily for convenience and information to the prospective purchaser of an automobile. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

Sent upon receipt of 6 cents in stamps for postage.

KNOX Waterless Commercial CARS

STAND AS LEADERS

Among business Vehicles *Knox Waterless Cars* stand as leaders. They excel in economy of time and money saved, in service rendered, in practical and scientific mechanism, and in ease of operation. They give dignity to the firm that employs them, and serve as a constant advertisement. All worry is eliminated—no water to freeze, no complicated machinery to care for.

Call at our agents' and have a free demonstration, or send for commercial car tests.

For Service Buy a Waterless Knox.

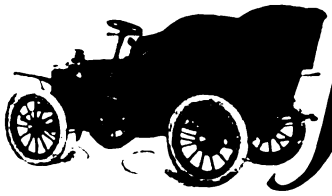
KNOX AUTOMOBILE CO., Springfield, Mass.

Members Association of Licensed Automobile Manufacturers.

Will exhibit at the Automobile Show, Madison Square Garden, New York, Jan. 14th to 21st, 1905.

THE MICHIGAN

LIGHT TOURING CAR FOR 1905



WILL CONSIST OF TWO MODELS, "D" AND "E"

Both will be equipped with the Michigan 2-cylinder 14-H. P. motor, which has proven so satisfactory the past season. Model D will have a removable tonneau and rear entrance, Model E a stylish side entrance body of very swell handsome design. Both have French bonnets, expanding hub brakes, and many other excellent features. Prices reasonable.

New catalog will soon be ready. Send in your name. Write for agency.

Michigan Automobile Co., Makers,

KALAMAZOO, MICH.

Auto-Talks

No. 3

In taking up the subject of performance in this "Auto-talk" we realize that our space is too limited to permit of thoroughly covering the subject. First, however, we will say that it is not our intention to offer as sole evidence of Autocar efficiency professional "records" or exhibition trials.

While the Autocar can show its share of these records, we believe that the average prospective purchaser is more interested in knowing the day-in-and-day-out behavior of the cars than in statements that they carried off such and such honors in such and such a contest. Following we print one of the many letters received from satisfied Autocar owners, because it tells of what was simply a private test of the car and in many respects an every-day trial.

WORCESTER, MASS., Sept. 24, 1904.

THE AUTOCAR COMPANY.

It may be of interest to you to know that I have just returned from a trip to Burlington, Vt., in an Autocar runabout, making the run in fourteen hours and twenty minutes, the distance being 236 miles over rough hilly country. In view of the fact that I had only *oil side lights* and four hours of the run was after dark it will be seen that the time was pretty fair. Over the mountain was the worst of the going, of course, but I seldom had to resort to the low gear, and then only for the *very steepest* pitches. The car is a wonder, and my companion got an eye opener in dead earnest.

The car gave absolutely no trouble except one tire, which I replaced at Rutland, as the tube was pinched.

The way it slid up those mountain roads was a caution to the natives. Yours truly,

H. E. SHILAND.

While we make no claims for the Autocar as a purely racing machine, its maximum speed of 35 miles an hour is, however, high enough so that the Autocar driver can feel he has a car to "eat upthe road" if necessary.

The points which we do emphasize in Autocar performances are these: Reliability under all conditions of roads and weather; ability to negotiate any traveled grade; extreme ease and simplicity of control, including brakes sufficiently powerful to stop the car in the minimum distance; simplicity and perfection of mechanism with consequent freedom from derangement; easy accessibility of all parts, and absence of vibration.

The Autocar has a speed range of from 3 to 35 miles an hour, and will travel 175 miles with one filling of the 10-gallon gasolene tank.

To give you a more practical idea of Autocar performance we will say that our dealers all over the country have cars for demonstrating to any intending automobile purchaser. Our booklet, which we will be glad to send you, gives full details of Autocar construction and name of our dealer nearest you.

Rambler

SURREY, TYPE ONE. 1905 Model.

2 CYLINDERS, 16 H.P., $1350. IMMEDIATE DELIVERY.

Thursday afternoon, October 13, Arthur Gardiner, whose name was formerly well known on the cycle track, and who now is final tester of every RAMBLER car made, drove the writer in a new Surrey, Type One, for a twenty mile run about Kenosha. The country is perfectly flat, and the black soil makes poor roads, deeply rutted, so that this high speed run furnished no hill climbing, but plenty of spring and power testing, as a narrow, deep rut made by farm wagons in soft roads pinches pneumatic tires, and tests the springing by side crooks. Part of the time the car had four passengers and part of the time it was on very bad, soft, muddy, uneven roads, always riding very smoothly, without the slightest tremble of the free front ends of the mud guards, which is most convincing proof of entire absence of vibration, and always with abundant power to spare. The car is as still as it should be, silencing perfect, no bouncing, easy side swing, and prompt response in every particular of control.—HUGH DOLNAR, page 86, *et. seq.* *Cycle and Automobile Trade Journal*, November, 1904.

We shall be pleased to send you a copy of THE RAMBLER MAGAZINE, and other printed matter, free, upon request.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, December 15, 1904. No. 12

TWO DAYS SESSION

Licensed Manufacturers Discussing Matters of Moment—Engineers' Branch Advanced.

While no inkling of its nature has been permitted to escape, that the executive committee of the Association of Licensed Automobile Manufacturers is engaged with matters of moment is indicated by a meeting at its offices in New York, which lasted all of yesterday and will be continued to-day; two days' sessions are not usual. It is frankly stated that business of importance is being transacted, but it is added that it is not for publication.

The two items of news that have been disclosed is the ratification of the transferral of the Crest license to Alden Sampson, 2d, of Pittsfield, Mass., and the furtherance of the projected engineers' branch of the association.

The latter was given impetus on Friday last, when the committee of five engineers appointed for the purpose met at the Engineers' Club, New York, and decided that such a branch was both feasible and desirable. A general meeting of all the engineers and superintendents in the association will be called for January 19, which falls during the New York show. At that time the organization will be formally completed. It will be styled the Superintendents' and Engineers' Branch of the Association of Licensed Automobile Manufacturers. It will, of course, deal entirely with constructional features and act in an advisory capacity, the aim being, as was stated when the project was first broached in October last, the study of methods and exchange of ideas that will render possible simplification of construction, the standardizing of certain parts, the reduction of factory costs, and, with it all, that reduction of the cost of automobile maintenance that is desired not less by users than by makers.

The "committee of arrangements," as it may be styled, were A. L. Riker, chief engineer of the Locomobile Co. of America; George W. Wesley, superintendent of the Electric Vehicle Co.; Henry W. McComb, superintendent of the Autocar Co.; Karl Almquist, chief engineer of the Worthington Automobile Co., and J. Frank Duryea, chief engineer of the J. Stevens Arms & Tools Works.

Fire Destroys Fifteen Oldsmobiles.

Of the fifty or more cars in the garage of the Oldsmobile Co., of Cleveland, Ohio, which was attacked by fire last week, fifteen were entirely destroyed and ten more damaged. The loss is placed at $10,000.

Neither the police nor the firemen have been able to discover how the fire started. The building is located at No. 411 Euclid avenue, and contains, in addition to the garage, the Euclid Avenue Bowling Alleys. More than a hundred people were in the latter when the fire started, and they fled as soon as the smoke began to appear. The flames spread rapidly, and by the time the fire engines arrived a number of the cars were on fire. The remainder, amounting to about half the total, were run out before the conflagration spread to them.

Fox Organizing Big Company in Syracuse.

It is reported from Syracuse, N. Y., that Charles A. Fox, of that city, is engaged in the formation of a company with a capitalization of $450,000, to manufacture automobiles. The company, it is said, will manufacture a touring car exclusively, which is to sell for $2,500. The papers will soon be ready to forward to Albany for incorporation, and then a factory will be secured.

Will Make Aluminum Bodies.

The Michigan Steel Boat Company, of Detroit, are preparing an attractive line of aluminum bodies, which are expected to be ready for the market in a short time. The designs for these bodies were worked out after the return of F. E. Wadsworth from abroad, where he made a study of the prevailing foreign types.

Adams Joins the Olds Staff.

Walter O. Adams, formerly treasurer and manager of the Crest Mfg. Co., and later with the Ford Motor Co. as assistant to Manager James E. Couzens, has resigned to take charge of the foreign department of the Olds Motor Works.

SAMPSON GETS CREST

Pittsfielder Buys Stock and Selden License of Cambridge Concern—His Plans Outlined.

After all, the Crest Mfg. Co. will not go out of business. The "For Sale" sign on the factory at Cambridge, Mass., or something else, attracted a purchaser in the person of Alden Sampson, 2d, of Pittsfield, Mass., and the latter is now the possessor of the entire capital stock of the Crest Mfg. Co. and of the material on hand, and also of the Selden license, which goes with the capital stock, and makes Sampson a member of the Association of Licensed Automobile Manufacturers.

It is understood that Mr. Sampson will produce as many Crest cars as the material on hand renders possible, performing the work at the Crest factory. Later he will manufacture a large car of his own, and ultimately remove the business to Pittsfield, where he has a considerable plant, and where only this month he purchased property for an enlargement of it.

Mr. Sampson formerly built the Moyea car for the defunct Moyea Automobile Co., and last spring entered a car for the Bennett Cup race, which was not, however, completed in time.

Russians Place Large Order.

The Northern Mfg. Co., of Detroit, Mich., are pluming themselves this week, and not without reason, over an order received from Russia for forty of the new Northern touring cars. Incidentally, this order has been the source of considerable satisfaction to Peter Fogarty, the New York agent of the company, who only recently returned from abroad.

Hartford Opens in Los Angeles.

The Hartford Rubber Works Co. has purchased the plant of the Williams Rubber Co., at No. 118 East Ninth street, Los Angeles, Cal., and will continue the establishment as a branch house. H. O. Harrison, former manager of the place, will be retained in that capacity.

Digitized by Google

BUICK IN JACKSON

Big Maker Selects Michigan Capital for Headquarters—Will Not Make Runabouts.

Advices from Jackson, Mich., state that it has been decided to concentrate the office and sales departments of the Buick Motor Co. at that place. The Buick plant in Flint will, however, continue to be operated and will produce the motors, while the other work will be done in Jackson.

Steps are now being taken to make the changes necessary to adapt the factory to the purpose of automobile manufacture, and it is expected that by February 1 cars made at the Jackson plant will be ready for the market. It is not intended to entirely discontinue work at the Flint factory at present, however. The force of men now there will be continued, and parts of the Buick car will be made; these will be taken to Jackson, where the work of assembling will be done.

It is the intention of the Buick Co. to turn out 1,200 cars during 1905. These will all be of one type—the 22 horsepower tonneau car, which made such a splendid showing at the Eagle Rock Hill climbing contest on Thanksgiving Day, and which lists at $1,200. It has been decided not to make a runabout model.

Wants Them Adjudged Bankrupt.

Efforts are now being made to have the Motor Vehicle Co., Louisville, Ky., declared a bankrupt. The concern, in which E. R. Thomas, of this city, is a stockholder, it will be recalled, made an assignment to J. S. Tracy a couple of weeks ago. The present proceedings have back of them the Charles C. Stoll Oil Co., Albrecht & Heick and the Louisville Gunning System. The petitioners, whose claims amount to a little less than $1,000, allege that the company, in making an assignment to J. S. Tracy, committed an act of bankruptcy. The petition further states that Tracy is believed by them to be a stockholder in the company.

Through R. Wortham Otter, president, the Motor Vehicle Co., consented to an adjudication in bankruptcy, admitting that they had been insolvent for four months prior to the time of filing the deed of assignment, which they admit was an act of bankruptcy. Judge Evans appointed O. G. Holt receiver in bankruptcy.

Won't Pay 25 Per Cent.

In the New Jersey Court of Chancery last week Vice-Chancellor Bergen appointed Justice Von Minden receiver of the Plainfield Auto Garage Co., the embarrassment of which was noted in last week's Motor World. Counsel for Andrew E. Wilson made the motion for the appointment of a receiver, claiming the company was bankrupt and insolvent. Justice Von Minden, counsel for William B. Smith, a stockholder in the company, was in court for the purpose of arguing against the appointment of a receiver, but he did not oppose the motion.

According to Judge Codington, counsel for Wilson, the liabilities of the concern are $2,500; assets unknown. The affairs of the company are in such bad shape that it will be impossible for creditors to receive as much as 25 cents on the dollar. The chief creditor is Andrew E. Wilson, who invested about $1,600 in the company.

Will Make Lamps, Will Burn.

W. S. Burn, an East Orange, N. J., manufacturer, has purchased from the receiver the plant of the Housatonic Mfg. Co., of New Haven, Conn. He will reorganize it and style it the General Mfg. Co. Under that name he will continue the manufacture of the Housatonic Co.'s line of goods, and add automobile lamps and other automobile parts.

Couzens Sweeping the Coast.

That the Ford Motor Company means to obtain its full share of the Pacific Coast trade is evidenced by the sweep that James E. Couzens, secretary and general manager of the company, is making of that portion of the country. He is visiting practically every point of promise, and will not return to Detroit until after the holidays.

Marion Completes New Plant.

The new plant of the Marion Motor Car Co., Indianapolis, has been finally completed, and will be occupied within a few days. It is of two stories, 60 by 120 feet, and in it will be located the offices and the assembling, finishing and body building departments. The machine work will be continued in the old shop, which adjoins the new one.

Disputed Repair Bill Leads to Law.

A deputy sheriff last week attached a racing car belonging to George H. Flinn, of Pittsburg, Pa., at a Forty-third street garage, in this city. He had previously received an attachment against Flinn for $1,329, in favor of Smith & Mabley, to cover a claim for repairs and storage. Flinn claims that the charges are excessive.

Church Retires From Business.

Norman W. Church, the well known Los Angeles dealer, has, on account of ill health, been compelled to sell out his business and go to Honolulu, where it is hoped the climate will have a beneficial effect. Church sold out to the Messrs. Anthony, who operate as the Western Motor Car Co.

Pattee's Claim for Kansas City.

Among the visitors to the Cadillac factory at Detroit last week was Fred Pattee, of the Cadillac Company, of Kansas City. Pattee affirms that Kansas City is a "Cadillac town," and points to a record of eighty-two cars sold there during the past season.

NORTHERN'S NEW LINE

Changes Made in Construction and Price—Choice of Four Bodies Offered.

Two models will constitute the Northern line for 1905, viz., the time-tested and popular runabout and the touring car which made its appearance at the New York show in January last. The former is retained practically unchanged. Divided or bucket seats have been substituted for the straight ones formerly used, and the price has been reduced from $750 to $650.

The touring car will be made with four styles of bodies—a side entrance, with seat facing forward, a detachable tonneau, a permanent tonneau and a single seat (two passenger). These are priced at $1,700, $1,600, $1,500 and $1,400, respectively. The double opposed horizontal engine, with cylinders positioned transversely, is retained in this model, but the cylinder dimensions have been increased from 5x5 inches to 5 1-4 by 5 1-4 inches, with the result that the engine now develops 18 H. P., instead of 15, as heretofore. The wheel base is 102 inches, as against 84 inches this year, giving plenty of room and insuring a corresponding freedom from vibration.

Packard Out; Maxwell Moves In.

No sooner had the Packard effects been removed from the building at 317-319 West Fifty-ninth street, this city, where the Packard branch has been domiciled for several years, than painters and decorators were put to work preparing the place for the debut of the Maxwell-Briscoe Motor Company, of Tarrytown, N. Y. The latter have, as stated several weeks ago, leased the premises and will occupy them as a branch house, with Colonel K. C. Pardee as manager. The plate glass front now bears the lettering "Maxwell Motor Cars," with the concern's catchy motto, "Perfectly Simple, Simply Perfect," underneath in smaller characters.

Buick Apportions Territory.

Orlando F. Weber, the well known Chicago and Milwaukee agent, has closed with the Buick Motor Company for Illinois and Wisconsin. In New York and Philadelphia, the Buick will be handled by the Electric Vehicle Company.

Broad to Start in Alpena.

H. L. Broad, of Alpena, Mich., will engage in the automobile business shortly after the first of the year. He has arranged to carry four lines of cars, and will also do a repairing business.

Smith in Foreign Lands.

F. L. Smith, general manager of the Olds Motor Works, is now on "the other side." He sailed so quietly that few knew of his departure.

Digitized by Google

THOMAS TALKS IN PARIS

Buffalo Manufacturer Lets Fall a Prediction for the Benefit of the Frenchmen.

E. R. Thomas, the Buffalo manufacturer, who is at the Paris show, has expressed himself as more confident than ever before of the great future of American automobiles, according to a cable dispatch from the French capital.

"Americans will be shipping automobiles to Paris within three years," declared Mr. Thomas. "Undoubtedly the French were ahead of us at first in mechanical equipment and methods of construction. Labor here is 15 cents an hour; at home it is 22 to 25 cents, but the superior quickness of our workmen evens this up. We can obtain material much more cheaply than the European makers can, and the price of material here is increasing rapidly. It may be that a prohibitive duty will be levied in France to keep our machines out, but we are certain to have the patronage of the rest of Europe.

"Since we adopted French designs, beginning where they left off, we have been in a fair way to surpass them. The French makers had an early advantage, due to situation and accessibility of mechanism, but even at the present time American manufacturers give more for the money than the firms here do. In America machines of 40 horsepower are sold for $3,000, while here that much money is demanded for cars of 20 horsepower. We build four hundred cars at once on the chance of prospective orders, while the French build one at a time, following orders. The present demand here and at home is for high powered machines."

Gilbert Appointed Sales Agent.

Le Roy Pelletier, manager of the Duquesne Motor Car Company, of Jamestown, N. Y., was in Detroit during the past week. With him was Joseph Gilbert, of the Firestone Tire and Rubber Company, who, in conjunction with his present work, will act as sales agent for the Duquesne Motor Car Company. As stated in last weeks Motor World, this company has been placed firmly on its feet by the introduction of capital from Jamestown and Erie and Corry, Pa.

Drawing Tight the Selden Line.

How closely members of the A. L. A. M. are adhering to its rules, and particularly that one forbidding the handling of licensed and unlicensed cars by the same concern, is shown by recent changes in the American Automobile Storage Company, of this city. That concern this year sold the Olds and another licensed car at its store on Sixtieth street, while the Oldsmobile Company, of New York, did the same on Thirty-eighth street. When Ray M. Owen, who was a large stockholder in and secretary and general manager of both concerns, became general sales manager for the Reo Car Company, and the Harrolds Motor Car Company acquired the agency for the Olds, it became necessary to divorce the Sixtieth and Thirty-eighth street establishments, as the Reo is outside the A. L. A. M. fold. This was done, the Reo offices and salesroom being located in the Thirty-eighth street premises. Even this was not enough, however, so Owen resigned as an officer of the American Company and E. S. Comancho was elected secretary. Thus Owen ceases to have any official connection with the American Company, which will continue to handle the licensed car referred to.

The Week's Incorporations.

Mishawka, Ind.—Simplex Motor Car Co., under Indiana laws, with $100,000 capital. Directors—E. D. Gulick, Rudolph Kamm and H. L. Bell.

New York, N. Y.—Maxwell-Briscoe, under New York laws, with $25,000 capital; to make automobiles. Directors — Benjamin Briscoe, J. D. Maxwell and Richard Irvin.

Portland, Me.—National Electric Construction Co., under Maine laws, with $500,000 capital; to manufacture electrical machinery and appliances. President, M. W. Baldwin, and treasurer, G. C. Knight.

Detroit, Mich.—Rapid Motor Vehicle Co., under Michigan laws, with $100,000 capital; $3,000 paid in, and $22,000 in machinery, automobiles, etc. Stockholders—Albert Marx, Barney Finn, Celia Grabowsky and Max Grabowsky.

Norfolk, Va.—Virginia Automobile Co., under Virginia laws, with $25,000 capital; to buy, sell, manufacture, own, lease and construct automobiles, etc. Officers—Moses Nushbaum, president; J. Roy Collins, secretary, and J. J. Hennelly, treasurer.

New Haven, Conn.—General Mfg. Co., under Connecticut laws, with $500,000 capital, $325,000 paid in; to manufacture automobile fixtures and lamps. Corporators and officers—W. S. Burn, president; S. C. Morehouse, secretary and treasurer, and Arnon A. Alling.

New Firm Formed in Worcester.

Norcross & Shiland is the style of a new firm in Worcester, Mass., that starts with excellent prospects, having already secured the Pope-Toledo and Autocar agencies. The members of the firm are Jesse O. Norcross and H. E. Shiland, the latter of whom has had four years' experience with B. A. Robinson, the veteran Worcester dealer. They will occupy the new store at No. 210 Summer street, comprising two stories and basement, 36 by 100 feet.

Here Comes the Boss.

J. E. Long and John Crawford, of Massillon, Ohio, have formed a co-partnership, under the style of the Long-Crawford Automobile Co., and will begin to assemble and sell a four cylinder gasolene car, to be named the Boss. It will develop 24 horsepower, and will have a side entrance tonneau body.

KIRK BACK FROM COAST

Speaks Enthusiastically of Conditions There and Tells What is Worrying the Dealers.

From all accounts, if one particular part of the country is to prove a "happier hunting ground" for the automobile trade than the other parts, the Pacific Coast is the one.

Ezra E. Kirk, of the Consolidated Mfg. Co., who returned to the factory at Toledo last week after a six weeks' visit to the country beyond the Rockies, is the most recent traveller to bring reports of the rose-hued conditions that exist there. He fairly bubbled with the enthusiasm he had contracted. Automobile interest, he states, is at fever heat, and evidence of it is to be seen and heard on every hand. The dealers, with scarcely an exception, are on the anxious seat, not for lack of orders, but because they have booked so many of them that they are fearful of delayed deliveries. Their season beginning so much earlier than is the case in the East, they want the new models now, and have not been able to obtain enough of them.

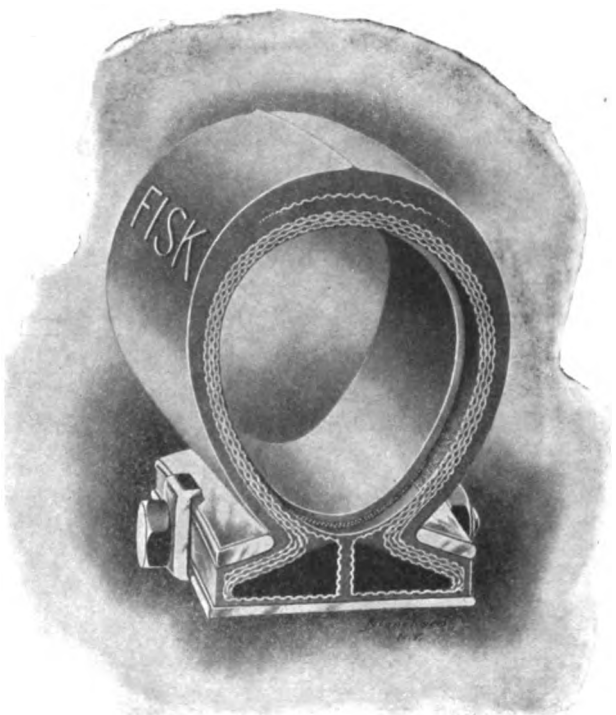
According to Mr. Kirk, these conditions prevail all the way from Los Angeles to Portland, Ore.

In San Francisco, he says, the rental trade has assumed proportions scarcely dreamed of elsewhere. In front of all the leading hotels, says Mr. Kirk, are long lines of rental cars, not electric cabs, but full touring cars, for which patronage is not lacking.

The Elmores for 1905.

R. C. Cornwall, of the Cornwall Automobile Co., Syracuse, N. Y., one of the many agents who took up the Elmore cars last season, to discover in them a veritable "find," was among a considerable number who visited the factory at Clyde, Ohio, last week, to renew contracts for the ensuing year. The Elmore line for next year, consisting of the 16 horsepower twin cylinder two cycle engines, side entrance car, listing at $1,250, and a 10 horsepower single cylinder detachable tonneau car, at $950, have elicited the warmest commendation. The Elmore people say that, contrary to the general impression, the majority of agencies are not waiting for the show to close contracts, adding, significantly, "They know better." Which remark may convey a world of timely information to the dealers likely to be interested in Elmores.

Colt's Car Christened "Cleveland."



The Cleveland Motor Car Co., with W. L. Colt at its head, the organization of which was exclusively reported in last week's Motor World, has located its executive offices and salesrooms at Nos. 388 and 390 Erie street, Cleveland, Ohio. The car, formerly the Meteor, will be styled the Cleveland, and will, of course, employ an 18 horsepower vertical four cylinder motor. It will list at $3,000.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

New York, December 15, 1904.

Time the Sleighs.

Although it is difficult to conceive how the Massachusetts law can be made more oppressive, it is stated with every appearance of truth that certain Bay State motorphobes will ask the legislature to still further "pile on the agony." In support of their prayer they will submit an accumulation of "evidence" in the form of reports or affidavits by men who spent the summer in timing automobiles in various parts of the State.

Whether or not evidence of the sort is brought to bear, it will be well for the Massachusetts automobilists and those of New York, New Jersey, Connecticut and other States to fortify themselves by timing the horse drawn sleighs just now so numerously in use. It is really an opportunity that should not be permitted to pass unembraced.

We believe it will be shown that the vehicles on runners average double the speed of the vehicles on wheels, by night as well as by day, and that their drivers are never arrested or in any way molested by the police. We believe it will be shown that when guiding a sleigh, the gentle farmer, the grocery boy, the milkman and all the other "poor men," who, according to Magistrate Crane, make our laws, are as persistent violators of the speed ordinances as the richest and most arrogant automobilist who ever drew the breath of life.

By all means let us have records of the sort. They can be used to good advantage whenever and wherever motorphobes raise their heads. It is a work in which all local clubs should engage, and by no means should the farmer folk be overlooked. Given a vehicle capable of speed, they are as prone as any one to travel fast.

Instalment Sales.

It is not often that the trade is a unit on any subject, but it would be difficult to find much difference of opinion regarding instalment sales of automobiles. As one tradesman put it bluntly, "After instalments will come the deluge. This is putting the case rather too strongly, for other businesses has gone through the instalment ordeal and come out alive and hearty; the piano trade being a conspicuous instance, and sewing machines another, not quite so rose-hued: That the automobile should escape, when it is almost marked out for the trying experience owing to the wide extension its use will eventually undergo, seems too much even to hope. Even the most optimistic observers do not expect permanent immunity.

Indeed, the entering wedge has already been observed seeking entrance. In Chicago last year a department store tried the plan of selling cars on instalments, while an automobile dealer in Washington is said to be preparing to follow the example. No marked success attended the former venture, perhaps because it was gone about very cautiously; while of the latter it is already prophesied that one season's trial of the plan will put the daring dealer out of business. That is prejudging the case, however.

It is scarcely necessary to say that endless arguments can be urged against instalment sales, and not one good one for them. Even the plea of necessity does not hold good. There is no excess of cars, and customers are to be found for all of reputable make that are produced. To deviate from the cash system now in universal use is to invite disaster without any corresponding gain in the unlikely event of success. No sane business man will bring himself to do this.

"To permit a piece of mechanism like the automobile to get into the hands of inexperienced users by the payment of only a tithe of the purchase money is foolish almost to the point of criminality," declared one tradesman to us recently. "He can ruin it at any time, or he may at any time unintentionally damage it to an extent greater than his equity in the vehicle. Could it reasonably be expected, then, that such a man will continue to meet his payments promptly? Why, if he can do this only by dint of strict economy, how will he do it when he has a big repair job to pay for? Or could it be expected that he would meet his payments and let the car stand idle until everything was settled? Certainly not."

Heretofore dealers have said to the instalment charmer, "Get thee behind me, Satan," and they probably will continue to do so for years to come. A further safeguard is the maker, without whose assistance few, if any, dealers can do an instalment business. It is pretty safe to say that they will prevent any driving home of the wedge, for they know too well the certain and speedy disaster that would follow the adoption of the system.

The Purchase of Special Steels.

In reaching out for special grades of steel to fill certain purposes there is one pitfall that the unwary must beware of.

It is the steelmaker who is not in the habit of taking care of special orders, who could do it perhaps if it was commercial, but it seldom is commercial. He has no men whose special business it is to look after special orders; he has no system in shipping, whereby such orders are followed to a finish with absolute certainty that the customer gets what he wants and what he asks for. Once in a while, however, a firm of this kind gets hungry for business and will accept such an order, and will even make very flattering quotations below what the conservative maker could make. He will take the order; then will come a rush of business that is more profitable to him, and the special order will never be properly filled.

It is much better to pay the price demanded by the systematic producer of specialties, because you get what you want, what you need and what you must have.

A good illustration of this was the purchase of a lot of open hearth die blocks by a concern under just such conditions. The steelmaker wanted the order, and promised anything and everything at a low price.

The die blocks arrived after a tremendous

Digitized by Google

delay, and without analyzing them or seeing whether or not they were what was asked for, the drop forger started in to use them. All sorts of difficulties were encountered during the hardening of the dies. Then the drop forger had some of them analyzed. The results showed the best of reasons for the bad behavior of the dies.

In the first place they were not alike, there were several qualities of steel among the lot. One die block in particular was just as bad a piece of steel as could be found in the market; not the right carbon, in the first place; the highest possible quantity of phosphorus and sulphur in it, and, on top of all that, high manganese, which always tends to produce cracks during hardening operations.

The regular producer of die blocks would not have dared any such behavior; it would have cost him too much in reputation.

It may be claimed by some that the drop forger was a fool to try to get open hearth die blocks, but this is not so, inasmuch as they are just as successful as any other die blocks when of the proper quality and put to the proper uses.

March of Improvement.

It is doubtful whether any year in the history of the industry can equal the present one in the general advance in construction that has taken place. With the New York show a month away, enough has been disclosed regarding the 1905 cars to warrant the assertion that, with scarcely an exception, they are better vehicles than their predecessors. They will be found more efficient, more reliable, more nearly in accord with the best constructional theories—both here and abroad—than they ever were.

It may be said that there are such changes and improvements made every year, and that some cars are being presented without material change from this year. Both contentions are supported by facts; but that does not alter the original contention. Nor is the reason for this step forward difficult to find.

One year ago the number of entirely new cars was very large. The industry was in a transition stage, and the influence of foreign construction and design was very great. This year there are almost or quite as many new cars, and the European influence is equally strong. But there is this difference: The foreign designs were being tried almost for the first time; now experience has revealed both the merits of these designs and the desirability—sometimes the necessity—of changes. It is no longer necessary to slavishly copy. We can originate, graft improvements on the imported stock, with marked benefit to the cars that must be used on American roads. This we have done, and the result will be apparent at the forthcoming shows.

Along with this improvement in the new models has come a very general, even if moderate, reduction in price per horsepower. It is true that there are many increases in price, but in all cases they are accompanied by more than proportionate increases in power, to say nothing of efficiency and reliability. There is scarcely a maker who has remained stationary. His aim has been to give better value than last year; and it makes little difference whether he has done this by delivering more power for the same price or reduced his price and increased his power, or increased both. The purchaser gets more in ratio to the price paid than he did a year ago, and if he is discerning he will perceive the fact before many months have passed.

"Spellbinders of the Bench."

It is to be said that Magistrate Crane's remarks before the Automobile Club of America on Tuesday night were distinctly disappointing. As one whose scolding and speechmaking proclivities when an automobilist is before him as a prisoner merit for him the title "spellbinder of the bench," there existed the hope that some new thought or a pearl of real price might fall from his lips. Shorn of his judicial robes, however, his address was without color, and suggested that the particular newspapers which he peruses daily are of the "yellow" variety. When he urged respect of the law he urged what is already generally respected by those who heard him, usually to the best of their ability. When he stated that it is the poor man who makes the laws, he gave utterance to mere cant. When he suggested, in response to ex-President Scarritt's well timed retort, that automobilists do the paid policemen's duty and bring before him those horsemen who offend the speed laws, he merely begged the question.

There was no advocacy of an honest law, such as will be easy of obedience; there was no criticism of the police for their one-sided enforcement of the law as it exists; there was nothing, absolutely nothing, broad-spirited or enlightening in all that the magistrate said. He had recourse to two flagrant and isolated offences committed by automobilists, and, like a "yellow" editor, he singled them out and harped on them with emphasis. He seemed to have no idea that all the automobilist asks or desires is a square deal—an equal and exact dispensation of justice, and not arrest and $50 fines for motorists who violate the law while men driving horses are permitted to violate the law with impunity or to escape with $5 fines—not scotchings from the bench while horsemen are dismissed with a smile or without a word; not the employment of flagrant and isolated instances as pegs on which to hang condemnations of all automobilists, while as was recently the case in New York two children were killed and three maimed within one week by horse drawn vehicles. What the automobilist desires is, if not justice tempered with mercy, then justice not influenced by the headlines of sensational newspapers or false fears generated by newspaper utterances. Real justice is not influenced by the hue and cry of even Mr. Crane's "poor men who make the laws." Real justice is not measured by the instrument with which an offense is committed. The use of an axe to crack a skull is just as bad as the use of a blackjack. The fracture of a speed law with a horse is as bad as its violation with a motor, even if Cranes won't see it.

The Automobile Club of America performed a service in disclosing Leroy Crane the man. It permitted a truer measure of the magisterial kind.

The snowstorm of this week has filled the roads and parks and avenues with the sounds of jingling bells and the crunching of the snow beneath the hoofs of fast flying horses. It is an inspiring sight. The New York daily papers, for instance, give generous space to the scene. They give the records of the blooded animals driven to racing cutters by well known men, and tell of the brushes and the "merry pace" at which they move. All of the horses are good for better than twenty miles an hour, most of them for twenty-five, and they are being driven to the limit. Even a Vanderbilt is included in the speeding throng. But, though the speed law is being violated, the police look idly on, the newspapers make no mention of it, "the poor man" is silent, and not a magistrate has had an opportunity to make a speech from the bench. No motorist begrudges the sleighers their pleasure, but just suppose a Vanderbilt in an automobile, or any number of other men in automobiles, "cut loose" on the same thoroughfares! And yet they say that the law bears on all alike, regardless of race, color, creed or manner of vehicle used!

FERRY TEST CASE HEARD

Court Listens to the Lawyers and Experts—Question of Freight is Raised.

Though he is himself a motorist and would be one of those who would frequently be bothered by the interpretation which he seeks to have placed on the "ferry law,' Assistant United States District Attorney Baldwin argued as the veriest motor-phobe might have done when the libel against the ferryboat Texas was before Judge Adams, in the United States District Court on Wednesday. The libel of the United States Government against the Brooklyn Ferry Company, owners of the Texas, and the answer thereto by the company's attorney, Herbert Green, have both been published in the Motor World, the libel being filed on November 7 and the answer on November 19.

The libel charged the ferry company with violating the United States statute, which prohibits the carrying of gasolene as freight on a passenger ferry, and provides that all fire, if any, in an automobile, must be extinguished before the machine enters a ferry which carries passengers. The libel asked that the regular fine of $500 for such violations be assessed against the ferry company. The answer denied that gasolene had been carried as freight, and that there was any fire in the machine, in the meaning of the law. At the hearing yesterday Mr. Green was aided by W. W. Niles, counsel to the Automobile Club of America, and he had Dr. Schuyler Skaats Wheeler present as an expert in gasolene construction. Dr. Wheeler is chairman of the Technical Committee of the Automobile Club of America, but was not called on to testify. The experts for the government were Dr. Frederick Hutton, of Columbia University, and Professor Dwight S. Jacobus, of Stevens Institute, at Hoboken.

Professor Jacobus said that if it were possible to see the interior of the explosion chamber of a gasolene automobile at the time the explosion takes place, a flame could be seen. He said further that he has examined an explosion, and that there was such a flame at the instant the explosion occurred. He also said there could be fire without any flame. Dr. Hutton, who is said to be a convert to the steam car, agreed to what Professor Jacobus said, and appeared anxious that no case be made for the gasolene car if the prohibition were to be extended to steamers only.

Mr. Baldwin said he realized the hardship which the strict enforcement of the statute would entail. He said he could better appreciate this, as he was the owner of a car himself and had been forced to have his machine pushed on and off ferry boats by hand. He told Judge Adams that the car which caused the libel to be made against the Texas was numbered 11,119, and that it was a water-cooled machine. He said the fact that it was necessary to cool the cylinders of the machine by the circulation of water proved that there was fire in it when the engine was running. He said that in a perfect car he did not believe there is any possible danger to any inflammable body that might be near the machine.

He told the Judge that he believed Congress had provided against anyone running an imperfect machine aboard a passenger ferry and keeping its engine going while the boat was making a regular trip. Mr. Baldwin also explained that on most automobiles the muffler pipe runs parallel with the frame of the machine and its outlet is near the gasolene tank of the machine, so that a fire was possible if the tank leaked. Mr. Baldwin also claimed that all automobiles that were transported on passenger ferries were carried in violation of that part of the statute which prohibits carrying gasolene as freight.

Mr. Green said that the car in question had been run onto the boat by its own power, and as soon as it was in the place on the boat appointed for it by the deck hands, the electric current had been turned off and the engine had stopped running. He said further that the engine had not been started up again until after the Texas was fast to its slip at the end of that particular trip across the East River. Mr. Green told Judge Adams that he believed Mr. Baldwin's contention that the gasolene in the tank of the car was carried as freight was erroneous. He said that if this were true, any boy who crossed the river on a passenger ferry with a partly filled kerosene lamp on his bicycle would render the ferry company liable to a fine of $500 for each such case. If a man were taking home with him a small bottle of gasolene to take stains out of his clothes, he also would make the company liable to pay a fine of $500 for each violation. As the statute also includes "loose cotton" in the list of interdicted articles, a lady who had been shopping and had with her a roll of cotton batting, would also render the company liable to the $500 fine if the statute were interpreted as Mr. Baldwin seemed to think it should be. He also said that the machine was not carried as freight, in any meaning of the term.

Mr. Niles said that Congress had passed the original statute and made the amendments thereto, with the sole idea of protecting to as great an extent as possible the lives of the passengers who used the ferry. He thought the aim had been to safeguard the passengers as much as possible while the ferry was on the river making its trip between its terminals. He called the attention of Judge Adams to the fact that the machine had been run onto the boat under its own power, but that the power was shut off and the engine stopped as soon as the car was on the ferry. Nor had the engine been started again until the passengers had begun to leave the ferry at the end of its trip, when there was no longer any danger of fire.

The attorneys for each side will hand in their briefs to Judge Adams within two weeks, and after he has studied them over he will make his decision in the case.

THREE ENTRIES IN HAND.

Eleventh Hour Swells American Representation in Bennett Cup Race—Dam May Enter Also.

Eleventh hour entries received by the Automobile Club of America for places on the American team for the James Gordon Bennett Cup race, to be run in France next summer, seemingly assure an adequate representation of this country in the historic contest. At this writing—Thursday morning—three bona fide entries have been posted with the Automobile Club of America, each of them accompanied by the required check for $600. The lists do not formally close until December 15 at midnight, and any entry mailed up to that time will, if in proper form, be accepted by the club. A fourth entry is talked of, but little is known about it, and it is not regarded seriously.

The entries now in hand, in the order of their receipt, are as follows: A 90 H. P. Pope-Toledo, entered by Colonel Albert A. Pope; a similar car, entered by W. T. Muir, of Lexington, Ky., a member of the Chicago Automobile Club, whose name has been proposed for membership in the A. C. A.; and a 90 H. P. Locomobile, entered by Dr. H. E. Thomas, of Chicago, and whose name is also before the A. C. A. as a proposed member. Of these entries, the first was received last week, the second came to hand on Tuesday and the third was received by the club on Wednesday morning.

With these entries, and any others that may be received with to-day's postmark, the A. C. A. will, within a week or two, make formal entry of an American team. This entry, together with a certified check for $600, must be in the hands of the secretary of the Automobile Club of France by January 1.

The only other entry in sight is that of Andrew Dam, a Westerner, who appeared at the A. C. A. rooms yesterday and made inquiries regarding the formalities necessary in making an entry. Secretary Butler gave him the necessary information, and he left saying he would seek a friend who was a member of the club and have him enter a car made by the Corless Engine Company, of Wisconsin, and called the Treene. It will, Dam said, develop 110 H. P.

Big Track Project in Newport.

Those bored members of the "400" who gather annually at Newport may be provided with an amusement that may arouse even their jaded interest, if reports from "Fashion's Summer Capital" are to be believed. It is said that an immense amusement park is to be installed there, the feature of which will be a two-mile track, on which automobile races will be held. The park is to be located at the north end of the city, and will be under the direction of the Newport Amusement Co. Reginald Vanderbilt is said to be one of those interested in the proposed track.

A Grand Prize

Has been awarded by the Juries of the
Louisiana Purchase Exposition Co. to

THE GEORGE N. PIERCE CO.

On its exhibit of

Pierce Automobiles

In recognition of superior quality in workmanship and materials, together with correct engineering and design.

The PIERCE Line for 1905 will include

PIERCE Stanhope, 8 H.P. - - $1200

Great Arrow, 24-28 H.P., Side Entrance, $3500

Great Arrow, 28-32 " " " $4000

Dealers can secure this splendid line now for all unoccupied territory and correspondence to this end is solicited.

THE GEORGE N. PIERCE CO., Buffalo, N. Y.

Members of Association of Licensed Automobile Manufacturers.

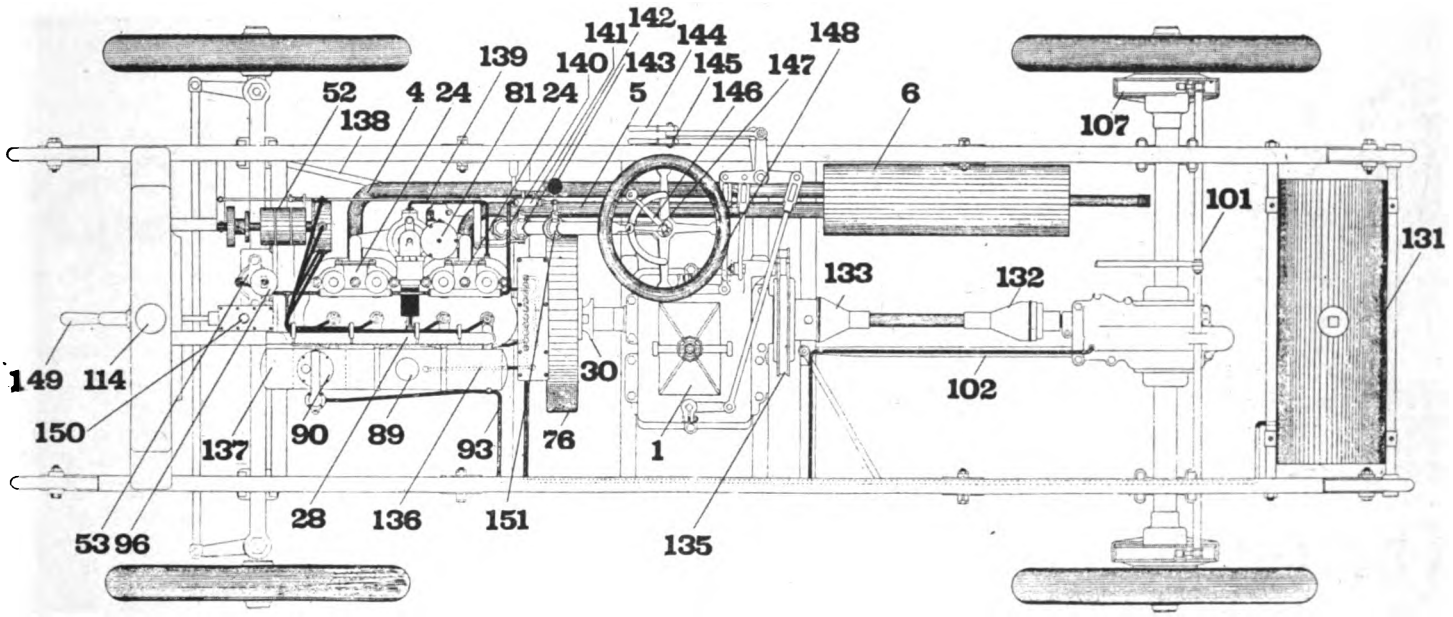
INTERNALS OF THE WINTON

The Many Ingenious Features Embodied in the New Car—Accessibility a Characteristic.

Not without reason do the Winton Motor Carriage Co. plume themselves on having made a "ten strike" when they designed their 1905 line. The cars offer a wide range of choice, the variation being from $1,800 for the 16 horsepower, Model C, to $4,500 for the 40 horsepower Special, with the Model B at $2,500 (24 horsepower), and the Model A at $3,500 (40 horsepower). The details of construction amply bear out the claims put forth in behalf of the cars. They have been designed with extreme care, every detail having seemingly received especial attention, in the effort to produce cars that in actual service will give the maximum of efficiency with the minimum of trouble. Accessibility of parts—and especially of the motor parts—has been aimed at and attained in a remarkable degree; simplicity of control, reliability of such essential parts as the ignition, lubricating and cooling systems, and a method of carburation designed to produce a constantly reliable mixture—these are some of the features of the car which merit more than common attention, as will be seen from the accompanying description.

Another feature worthy of remark is the system of numbering the various parts, so that in ordering there will be no confusion or mistakes. The cuts accompanying the text will be found extremely useful.

The side members of the frame are pressed from sheet steel in one piece, channel section, the depth of these members varying from 1¾ inches to 5 inches. No sub-frame is employed, the motor and transmission being carried on malleable drop frames. At the forward end of the frame the radiator casting serves as a frame spreader, and also as a bearing for the starting crank. Two cross tubes join the rear ends of the side members, being attached between the two spring hangers; these tubes also support the gasolene tank. Semi-elliptical springs are supported on horns on either end of the frame.



The springs themselves are of a special patented design, used exclusively on Winton cars. The springs are so constructed that they compensate for the varying loads carried. A double spring of six leaves is so shackled that only three leaves are engaged when the load is light, while if it is heavy all six leaves are brought into engagement.

The rear and front axles are constructed of special axle steel, and are mounted on special roller bearings. The twelve spoked artillery wheels, which vary in size from 30 inches to 34 inches on the various models, are keyed to the axles and held in position by nuts. The rear axle pinion shaft is hardened, and revolves in a bronze bushing. The axle cases are split—Model C horizontally and the other models vertically, and a single ball joint strut limits movement of the axle and absorbs the breaking and driving strain.

Accessibility is the crowning feature of the new Winton motor. As is well known, it is of the four cylinder vertical type, water cooled and mounted in front under a bonnet. The cylinders are cast in pairs, with heads, water jackets and exhaust valve chambers integral. Crank shaft, connecting rods and pistons are quickly removable, without disturbing cylinders or motor accessories. The cam shaft gears are inclosed.

The method of obtaining access to the motor is simple and ingenious. The aluminum crank case is split vertically, one side being readily detachable. On this side are two openings, through either of which inspection is easy by turning a hand screw and lifting the cover. If, after inspection, it is desired to remove the working parts of the motor, the entire side of the crank case may be detached by removing the bolts that hold it in place, thus giving ready access to them without having to get underneath the motor.

The forward end of the crank case incloses the cam gears, fan gear, pump gear and magneto idler, permitting liberal lubrication thereof and excluding dirt. The crank shaft, connecting rods and valves are drop forged, and the crank shaft and crank pin bearings are of ample length to minimize wear. All crank bushings are split, providing for adjustment in taking up wear. The inlet chamber castings are cast in pairs, and are bolted to the cylinders, having copper asbestos gasket joints. The inlet valve caps may be unscrewed by hand for inspection purposes, exposing the action of the valves in operation.

WINTON CHASSIS.

The motors exhaust through one outlet for each pair. These outlets lead downward and then longitudinally into the expansion chamber, placed beneath the tonneau. From here the exhaust passes noiselessly into the air.

The well known Winton system of transmission by individual clutches in retained with some detail changes. The gear case, which is made of aluminum and split horizontally, is located immediately beneath the front footboard. The dust and oil proof case cover can be instantly removed by simply unscrewing a hand wheel, while by removing the upper half of the case, which is bolted to the lower half, the entire transmission can be removed. Two speeds forward and a reverse are provided, the drive being direct on the high gear.

Another time tested feature that has been retained is the well known Winton air governor. This gives the widest possible range of speed, the variations being obtained either by a hand lever or a foot button, the pressure being either constant or variable. The Winton system of air governing throttles not the quality, but the quantity of the mixture, the quality remaining always uniform. The throttle is actuated automatically by air pressure, produced by a gear driven pump, which forces air against the plungers on the

Digitized by Google

inlet valves and keeps these valves seated. Consequently the valves cannot open to supply mixture to the cylinders undess the pressure is relieved. There are two methods of relief—the hand lever above the steering wheel and a spring button under the driver's right foot. By the use of either lever or button, air is released in a constant or variable volume, as the operator desires, so that the inlet valves may lift correspondingly. The engine then draws a proportionate supply of mixture and reaches a relative speed. The operator may relieve the pressure by minute degrees from the entirely closed point to a point where pressure is no greater than non-compressed air, so that the motor is governed with extreme flexibility.

One water jacketed, float feed, compensating carburetter supplies the mixture to all cylinders. This carburetter is placed close to the motor, and, being water jacketed, temperature variations cannot prevent its successful operation. The gasolene is pressure fed from the main tank, placed under the tonneau, to the auxiliary tank, located above the cylinders, and is thence gravity fed to the carburetter float chamber. The gasolene passes into the auxiliary tank through a strainer, thereby preventing the possibility of foreign substances working into the carburetter. A pet cock on the auxiliary tank enables the motorist always to have gasolene at hand for cleaning purposes. It is impossible for the gasolene to flow back from the auxiliary tank to the main tank.

Extending through the dash is a hand screw, by turning which the supply of gasolene may be instantly cut off from the carburetter or as readily turned on again.

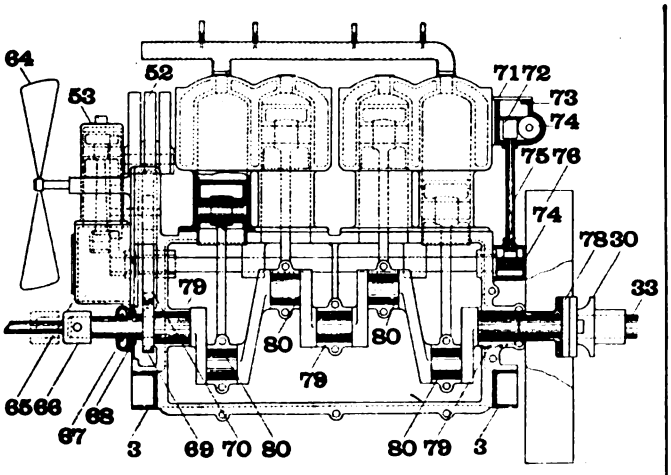
An absolutely reliable system of ignition is claimed to have been obtained by using a gear driven, alternating magneto in conjunction with a single non-vibrator coil. From this coil the secondary current is returned to the magneto and distributed to the spark plugs through a mechanism integral with the magneto; the interrupting mechanism is also a part of the magneto.

Of more than ordinary interest is the method of lubrication employed. Attached to the motor and extending through the dash is a worm driven, roller feed lubricator, which lubricates by direct feed.

From the reservoir above the cylinders lubricating oil is fed by gravity to the automatic lubricator, being received in a float chamber, whereby a constant level is maintained and oil flow prevented when motor is not running. From this chamber oil passes into the main chamber of the lubricator, where a gear driven aluminum roller revolves in it. The viscosity of the oil being variable with the temperature, the thickness of the oil film on the roller would increase as the temperature decreased, resulting in an excess of oil at low temperature. To provide against this condition an adjustable metallic scraper carries off the superfluous oil, limiting the thickness of the film to the distance between the scraper and the roller. Passing this scraper, the oil film engages a second scraper, in contact with the roller, by which it is directed in equal quantities through the ten oil leads extending to all the bearings of the motor and of the rear axle.

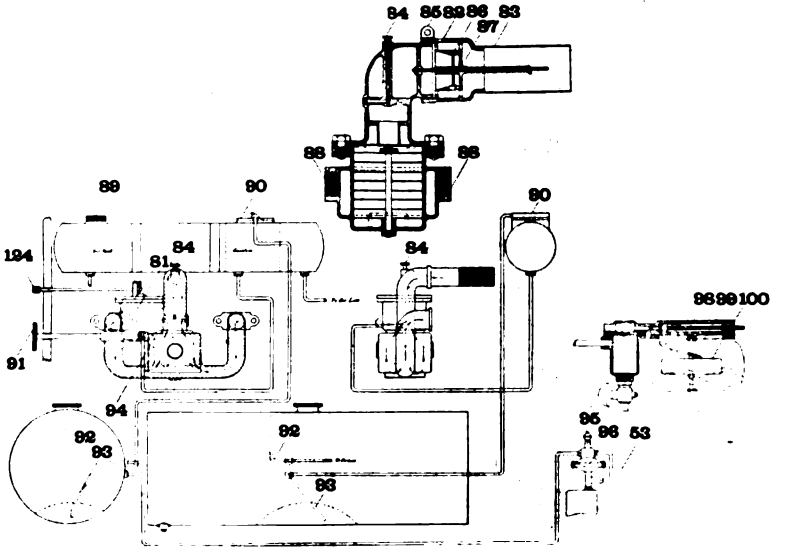
This system of lubrication provides an oil feed in exact proportion to the motor speed; assures a uniform feed in any temperature, with light or heavy oil; has no springs or valves to get out of order and cause trouble and expense, and operates without pressure. The location of the oil reservoir and lubricator, both being directly atached to motor, assures fluidity in any temperature by reason of heat passing through bonnet.

The cylinders, carburetter and exhaust valve chambers are all water jacketed, and a constant circulation of water is secured by means of a gear driven centrifugal pump. The water is circulated through a vertical tube radiator, with fins; a fan back of the radiator and a secondary fan cast in the flywheel aid in the work of cooling. No water tank is carried. The water is admitted to the radiator at the top, and flows downward through a sieve distribution into 89 copper tubes; each of these tubes is 17 inches long, with 13-16-inch square radiating fins, spaced 3-16-inch apart. From the bottom of the radiator the water flows to the circulating pump, and is then forced upward to the water jacketed portions of the motor and into the upper water connection, which directs it back to the top of the radiator.



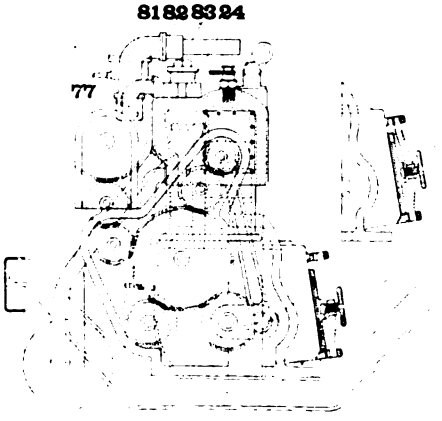
The muffler consists of a single expansion chamber of generous size, which acts so efficient that no cut-out is necessary; the exhause is claimed to be practically noiseless.

A permanently attached dustpan beneath the motor provides an effectual method of preventing the entrance of dust, mud, etc. It is a decided improvement over the leather or rubber apron frequently made use of.



One pedal and two levers control all transmission clutches and brakes, while levers placed above the steering wheel operate the spark advance and throttle mechanism.

The gasolene reservoir holds fifteen gallons. The only other tank is one of three compartments placed above the cylinders. The forward chamber acts as a receiver for the air line, the middle chamber contains the auxiliary gasolene supply, and the rear chamber carries the lubricating oil. This tank is higher than the level of the carburetter, so that the gasolene flows therefrom by gravity to the carburerter float chamber.



The starting crank is not detachable, but

WINTON MOTOR IN SECTION.

WINTON CARBURETTER.

Winton Motor, side elevation, show detachable portion and handhole cover.

Digitized by Google

is shifted into engagement through a spiral slotted sleeve and out of engagement by a helical spring.

The dropped front axle is of Lemoine type forward steer.

The construction used on all external motor and transmission bearings returns back to the case all oil that works out of the bearings. Drains are placed at the bottom of the crank case and transmission case for removing the oil. They also permit of flushing.

The top water conection supports fibre bushed rings carrying the wires to the spark plugs, preventing the chance of short circuit.

Between the motor and transmission is a flexible coupling,(which accommodates itself to abnormal road conditions without straining the mechanism. The universal joints are inclosed.

Three of the models—A, B and C—are supplied with side entrance tonneau bodies, seating two in front and three in rear. These are made with cast aluminum body panels and laminated wood seats. The front seat is divided. The upholstery and trimmings are made of first quality hand buffed leather, best gray drawings and 4-inch cushion springs of best temper; made up on heavy sail duck; all buttons wired in. Pockets on tonneau doors for gloves, etc. Roomy lockers underneath front and tonneau seats accommodate touring paraphernalia.

On the Model C the bodies are furnished either in silver gray or maron; it is optional on the other models.

Fire Leads to Transfer of Garage.

Negotiations were brought to a successful conclusion late last week, whereby the Standard Automobile Company, of this city, acquires a commodious garage to take the place of the one gutted by fire a week previously. It has purchased from the Central Automobile Company, 1684 Broadway, the garage business of the latter, including the good will. Thereupon the Standard Company entered into immediate possession of the extensive Broadway premises of the Central Company, taking over the entire stock of cars there on storage and continuing the contracts entered into with the owners of the cars.

The Central Company, meanwhile, will continue to have an office at the Broadway place, from which they will make sales of Mors and Napier cars. It is the intention of the concern to secure larger quarters and to open them as a fully equipped salesroom for the cars mentioned—which will continue to be the leaders—and for others which may be added to the line.

Chester Woodward, of Lawrence, Kan., had his automobile stolen some time ago, and was recently informed that it had been found in Cleveland. The thief had driven it over the roads between the two cities without any breakdowns.

CRANE OFF HIS PERCH

Magistaate Orally Hops About Betraying Child-like Timidity and Voicing One-sided Ideas.

"Gentlemen of the Automobile Club of America, I am going to tell you some plain truths to-night; pleasantly, to be sure, but none the less plainly. The burden of my text is this: that you must respect the law and obey it."

Thus impressively did City Magistrate Crane, who had been invited to address the Automobile Club of America on Tuesday night on "The Automobile and the Magistrate," begin his talk, and the nearly two-score members who had been drawn to the meeting by the announcement of Judge Crane's presence, settled themselves to hear some straight from the shoulder remarks.

Judge Crane, who was attired in conventional evening costume, was perceptibly nervous. As he stated, he was no speaker, but just a plain citizen, whose life was made miserable by speeding automobiles. And after this brave opening he plunged into a long-winded, rambling discursive talk on the sins of omission and commission of motorists; larding his denunciations with disclaimers of any personal feeling against his hosts, for whom, as merchants, lawyers, railroaders and men of affairs generally, he had the kindest feelings. He alternately scolded and flattered, besought the club to use its influence to see that every "driver of a machine" should come to respect the law and obey it. That was his Alpha and Omega—the law and how it was to be obeyed, although, with characteristic illogic, he assailed it as being complex and inadequate.

"You, gentlemen," he said, "represent everything that is good in every walk of life except automobiles. You must get the confidence of the people and thus have them respect you. You must respect them and the laws they make. The poor people make the laws of this city, and you must obey and respect them.

"I have dodged automobiles every night for months until to-night, when, thanks to the beautiful snow, they are banished from the streets." (There were three cars outside the clubhouse waiting to take their owners home.) "Three times I have been almost run over, just escaping by jumping quickly. Just think of the poor farmer who was run down and left to die on the Pelham Parkway last month, without a helping hand; do you wonder at the feeling toward automobilists? You gentlemen have offered $100 reward for the arrest and conviction of the miscreants who wrought this awful deed. But it is not enough. You are rich men, and you ought to make that reward $1,000 at least. It will all come back in respect—the respect the people will feel for you.

"Now, let's talk about the legislator. People think that the automobilists had the present law passed to suit themselves. There are four different laws, and each one of them contradicts and supersedes the others. It would take an Egyptian prince (sic) to understand the law. What you want to do is to make the law plain and strict, so that men who don't obey it shall be punished. Make the penalties heavier and enforce them. Have the punishment $50 for a first offence, $100 and ten days' imprisonment for the second and $200 and thirty days for the third. That will remove the fear of the people that their children will be run over by these machines.

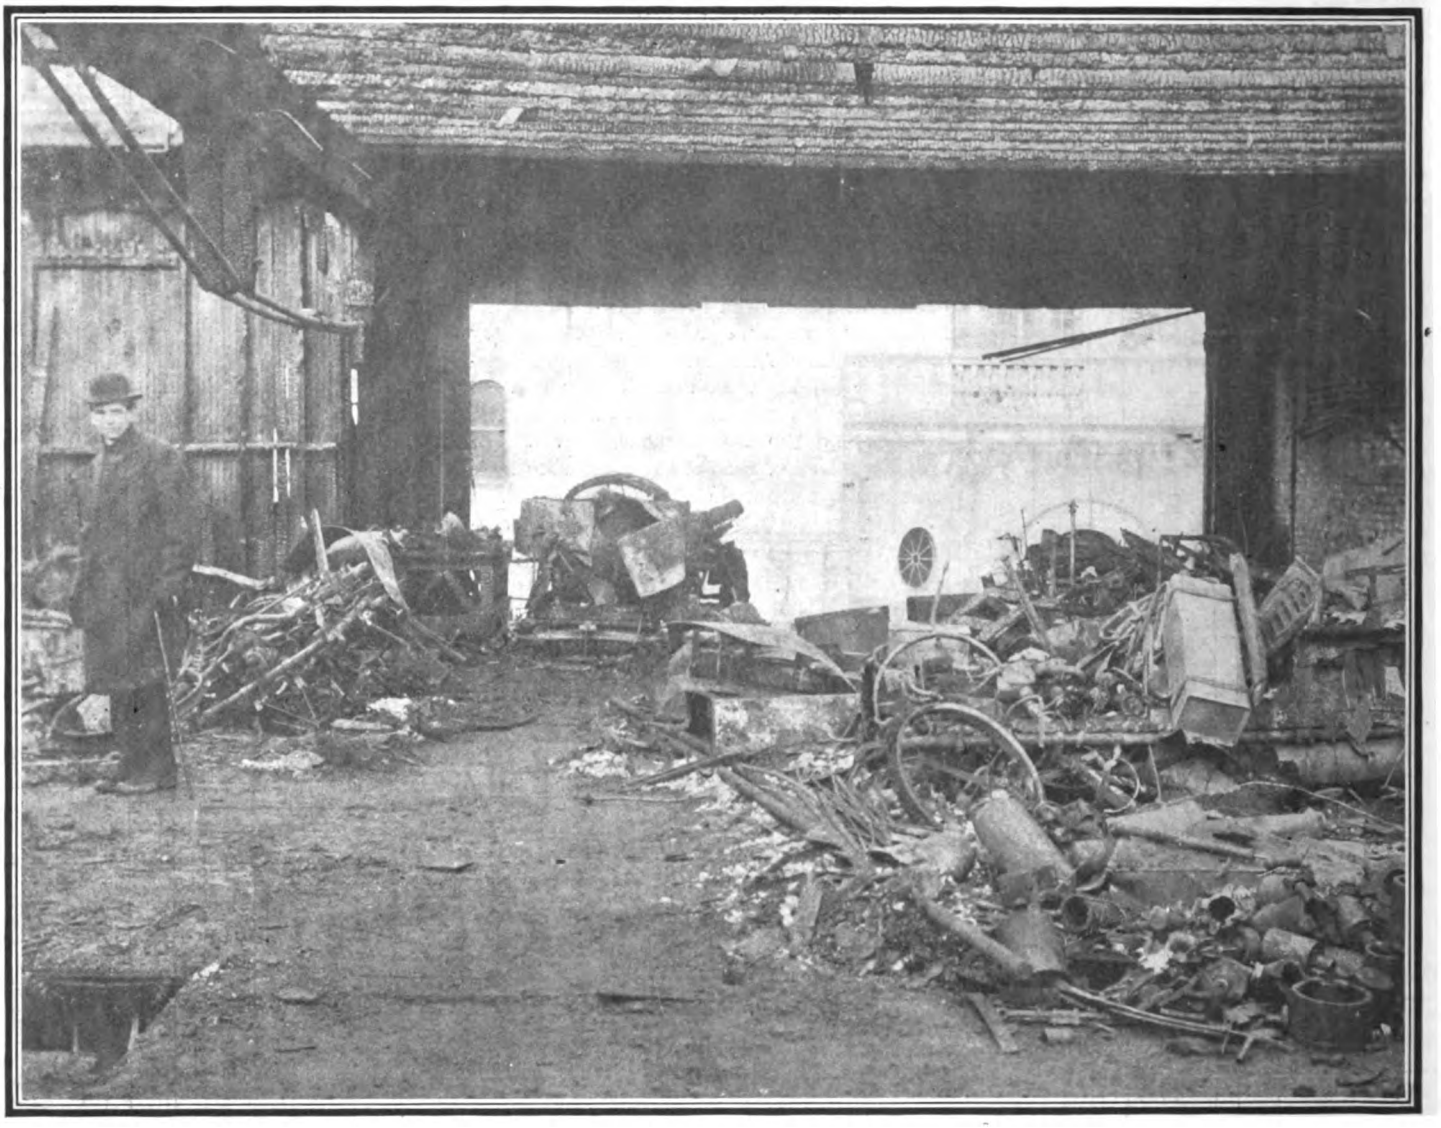
"The magistrates of this city are a body of men kind and merciful to you automobilists. We want you to go out in your machines, merrily and gayly, and have a joyful time; but you must respect the law. Have on your walls in big, black letters, 'Obey the law.'

"Well, I am taking up too much of your time"——. A long pause ensued, and then ex-President Shattuck said, politely, "Not at all."

"As I was about to leave home to-night, my children asked me where I was going, and I replied, 'To speak before the Automobile Club.' 'Give it to them, papa; give it to them hard.' That shows you that even the children are against you," concluded Judge Crane.

In thanking the speaker, President Morris took occasion to say that there were 16,000 registered motorists in this State, while the A. C. A. had only 500 members, or about 3 per cent., so that the club could scarcely be held responsible for the conduct of all. He then asked if any member wished to put any questions to Judge Crane.

Ex-President Scarritt said that he was often reminded of Charles Reade's novel, "Put Yourself in His Place," when he thought of the present situation. That is what non-motorists should do. Motorists want to obey the law, but the law should be such that it is possible to obey it. But it is not. What he objected to was the unfair discrimination that was shown. "An automobilist, therefore a criminal," was the conclusion of too many of his friends on the bench. All vehicles violated the law. The A. C. A. last spring conducted tests on Riverside Drive and showed conclusively that both automobiles and horse-drawn vehicles persistently violated the speed laws. But, while plenty of motorists were arrested, whoever heard of this happening to a horseman?



Replying to this, Judge Crane said that he did not discriminate. "Bring me a horseman who has violated the law and I will punish him," he cried. He went on to make an earnest plea against employing chauffeurs who drink. This struck a responsive chord, and all the subsequent speakers indorsed his words in the strongest manner.

Some light on legislation at Albany was shed by ex-President Shattuck, who said that at the last session, had the legislators been willing, a simple, plain law would have been agreed on. But the automobilists had to fight the legislators with their own weapons, and the present law was the result. Mr. Shattuck also spoke on the need of enforcement of the traffic rules in this city, and commended the efforts of Commissioner McAdoo to bring about an improvement in this respect.

Colgate Hoyt, F. G. Bourne and other members also spoke.

How They Look After Going Through Fire.

THE REMAINS OF FOUR BIG TOURING CARS AFTER THE STANDARD FIRE.

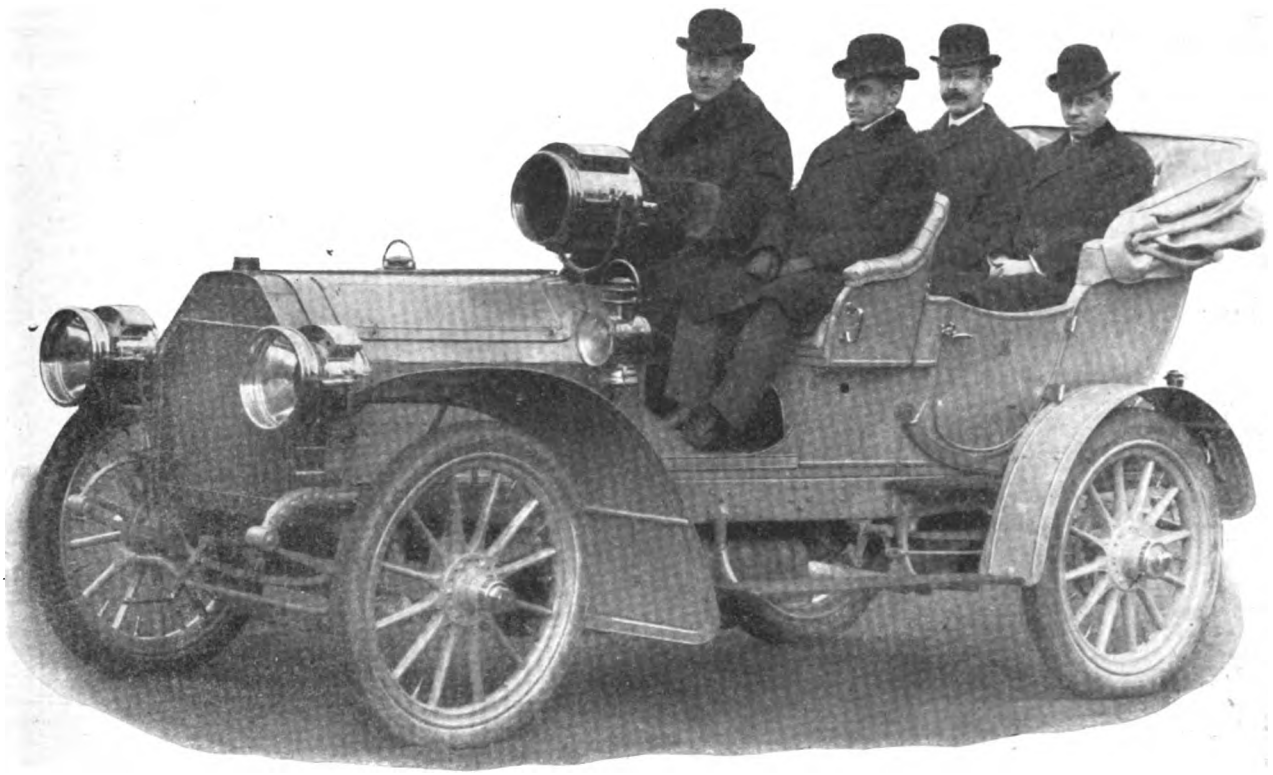
Fire Department Closes a Garage.

As a result of the disastrous fire in the Standard Automobile Co.'s garage, in West Thirty-ninth street, last week, Fire Commissioner Hayes has started a rigid investigation into the gasolene storage question in New York City. Fire Marshal Peter Seery has been engaged in an attempt to determine just what caused the fire, but had made no official report up to Wednesday night. The falsity of the scarehead reports regarding explosions is shown by an inspection made after the fire by George E. Murray, superintendent of the Bureau of Combustibles. He said that the only explosions were those of two tanks of machines which were on the upper floor, where the heat was greatest. He found that the 100-gallon gasolene tank, buried two feet under the floor, was entirely unharmed. His inspection showed that the Standard company had fully complied with the laws regarding safety in such places.

In the course of Commissioner Hayes's investigations this week, he found that two hundred and fifty persons are employed on the upper floors of the building at Nos. 132 to 140 West Twenty-seventh street, where the garage of the Michelin Tire Co. is situated. As he did not think it was safe to permit the storage of gasolene in quantities in the building, he revoked the Michelin company's garage license on Tuesday last.

Helps at the Paris Show.

Following the usual custom, a number of conferences are being held during the Paris show. At these conferences papers are read by men of prominence in the automobile world, and discussions of the subjects take place. This year the papers and their authors are as follows: "The Automobile in General" and "Clutches," G. Forestier; "Electric Vehicles," "Motors in General" and "Electric Ignition," Arnoux; "Carburetters in General," L. Perisse; "Electric Transmission," Gasnier, and "Alcohol and Heavy Oil Carburetters," Lumet.



Broadening Y. M. C. A. Instruction.

Since the opening last month of the new term of the Boston Y. M. C. A.'s Automobile School, the work has been broadened and improved by the addition of a great deal of practical instruction on the floor of the garage. Small groups of students are being assigned to an instructor, and each given a thorough drill in the mechanism of the car. The mechanism is "queered" or thrown out of gear and the students are set to hunt for the trouble. A request has been received from a number of business men, brokers and others, who are unwilling to give their evenings to the school, for the establishment of a day course, and this matter is now under consideration.

It has been suggested that the shop be open on certain afternoons from 4:30 to 6, where the practical work might be studied under the same men who have charge of the night courses. A number of persons have made application for such a course, and if sufficient interest is manifested it will be undertaken with the opening of the new year.

The Most Powerful Peerless With a Notable Load.

The first of the new 50 horsepower Peerlesses is very much in evidence out Cleveland way, and is shown by the accompanying illustration. A. E. Morrison, manager of the Peerless branch, is at the wheel, and beside him is Secretary L. H. Kittredge. E. H. Parkhurst and L. P. Mooers, of the factory management, are seated in the tonneau. The car is fitted with a motor which is the exact duplicate of the one employed in Oldfield's Green Dragon, than which it is unnecessary to say more regarding its power and speed.

Oldfield Again Batters Record Table.

Fresno, Cal., had scheduled an automobile race meet for December 13, but the rain came down and converted the trotting track into a circle of mud. But as Barney Oldfield and his Peerless "Green Dragon" were the star attractions, the promoters found a way to permit them to perform. Barrels of gasolene were emptied on the track and set a-fire, drying out the surface so thoroughly that Oldfield was enabled to further "burn up" the track and establish new world's records from fifteen to fifty miles.

Oldfield himself held the former fifteen-mile time, having placed the record at 14:05 at Denver on November 5 last, but at Fresno he bettered this time by two seconds. His new record for twenty-five miles is 23:38 1-5, and his time for fifty miles 48:39 1-5. The former twenty-five-mile record was 23:59, and for fifty miles it was 55:42. Both of these records were made at Cleveland on October 19, 1904, Earl Kiser being the maker of the twenty-five-mile record, and Charles Gorndt of the other.

East Orange (N. J.) motorists have made complaint that raised sidewalks across the streets give cars and their occupants a jarring that no amount of care in driving or the fine adjustments of springs can avert. They therefore ask that a reform in this direction be made.

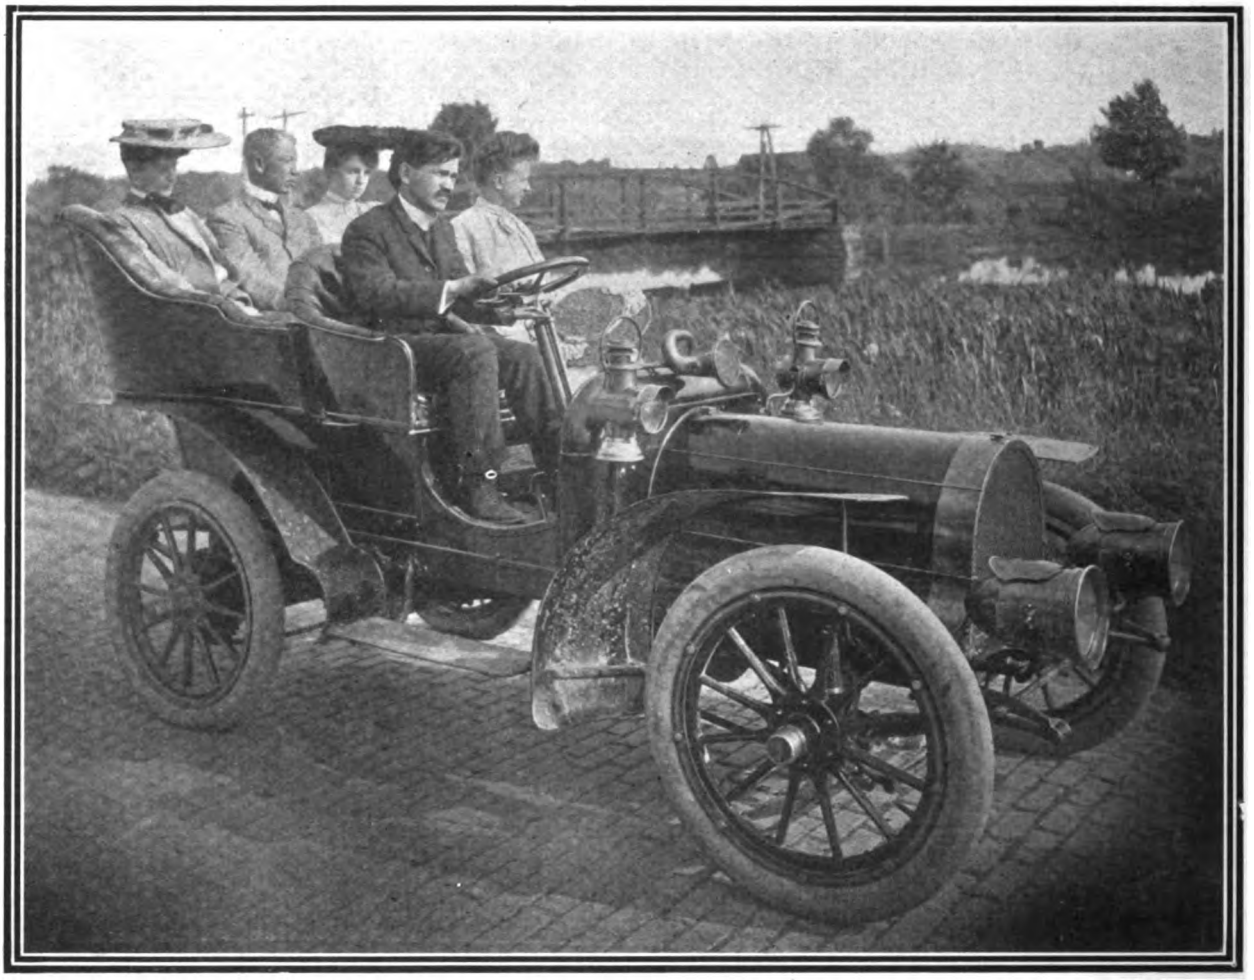
Two Automobiles to Replace 19 Horses.

City Electrician Ellicott, of Chicago, is making experiments to determine if automobiles cannot be employed in his department to better advantage than horses and wagons. Two cars will be used for two months, and careful track will be kept of the work of each of them. One will be used by a fire alarm repair crew and will carry a load of material, in addition to the workmen. The other will be used in the night electric light patrol service. Speed is the essential quality in this service, which is maintained for the purpose of keeping the electric lights of the municipal plants in working order.

"I believe that the city will save money by substituting automobiles for horses," said Mr. Ellicott. "We are keeping nineteen horses and wagons now for the work that two automobiles can do. It costs on an average from $450 to $500 a year for the maintenance of each horse and wagon. We are going to make the experiments at the worst time of the year and in districts where the streets are in the worst condition imaginable."

Without sticking his tongue in his cheek, Mr. Ellicott, who has wept tears over violation of the speed limits, says that the drivers of the two experimental machines will be required to give a written guarantee that they will not drive the machines faster than ten miles an hour.

New Club Forming in Detroit.



Fathered by William E. Metzger, Roy D. Chapin, "Ned" Broadwell and others of the local trade, a project is well under way to establish an automobile club in the Russell House, Detroit. Arrangements to that effect are being consummated this week with the Russell House management, who are heartily in favor of the scheme, and who have agreed to fit up in the rathskeller of the hotel suitable quarters in the form of reception, dining and smoking rooms. It is proposed to have the dues for resident members $20 per year, and for non-residents $10. The membership will be limited and by invitation only for the present. It is expected that the new club will take the place of the practically defunct Detroit Automobile Club, and with such moving spirits as those named the future of the new organization would seem to be assured.

Reward Offered for a Coward.

The Board of Governors of the Automobile Club of America, at its meeting last week, took action on the case of Jacob Clemons, the farmer whose wagon was run into by an unknown motorist on the Pelham Parkway on November 16, and who was wrapped in a blanket and left at the roadside. The governors, on behalf of the club, offered a reward of $100 for the arrest and conviction of the guilty person or persons.

Demonstrating the Duquesne Car.

With the strong infusion of fresh capital, as detailed in last week's Motor World, the rejuvenated Duquesne Automobile Co., Jamestown, N. Y., is now "hard at it" producing cars, which will be of the type shown by the accompanying illustration, save that, instead of chains, they will employ bevel gear drive and planetary gearing. The car will be fitted with a four cylinder vertical motor, 3½x4 inches, developing 16 horsepower at 1,125 r. p. m. It will, of course, have a side entrance tonneau; indeed, the Duquesne people claim to have been the original pioneers in this form of body construction, in that they permitted entrance to the car by the tilting and swinging of the front seats. The new Duquesne will list at $1,750.

Italy's Successful War Experiments.

During September an interesting and successful trial of automobiles under the auspices of the Italian Minister of War was held, in which it has been demonstrated to the entire satisfaction of those concerned that automobiles can be used to advantage in war times. As horses owned by private persons are subject to requisition by the military authorities in the event of war, an attempt will be made to render automobiles subject to the same law.

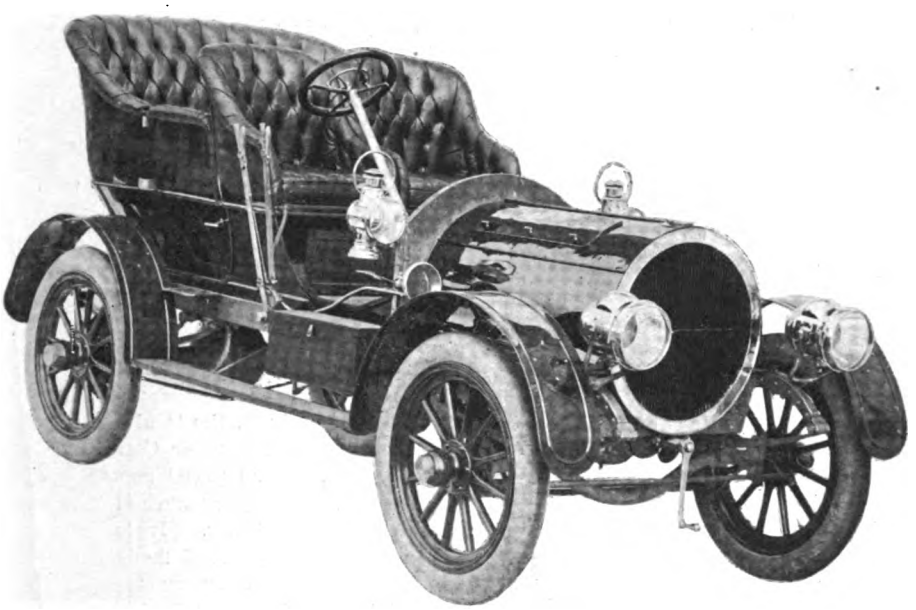
Fifty owners of automobiles were invited to take part in the manoeuvers, and of these thirty responded. Thirteen routes were selected, leading to various points on the eastern, western and northern frontiers. All covered a considerable length, and many were difficult. One led to the fortress of the "Spluga," lying at an altitude of 2,107 meters (6,909 feet) above the sea level, and another to the "Stelvio," at a height of 2,756 meters (9,042 feet), which is the highest carriage road in Europe.

At dawn, September 1, each chauffeur of the thirty automobiles participating left the town of Brescia by a certain gate, and then opened a sealed order containing the route laid down for him. In view of the supposed invasion of the country by an enemy the routes were selected with regard to safety as well as speed. The distance had to be covered within twenty-four hours, and the military authorities made every preparation for verifying the routes, time of departure and arrival, etc. Copious notes, also, were taken in order to suggest improved methods in future trials. Some of the cars carried officers.

Every one of the cars returned to Brescia before midnight of the same day, and but one of them had an accident. Two cannon were transported by the automobiles, and bread and other supplies were taken to fictitious military camps. In rapid delivery of important supplies, such as heliographs, field telephones, etc., and for many other strategical purposes, it was found that the new service went beyond all expectations. The longest distance covered was 540 kilometers (335 miles).

Favorable to Oiled Roads.

The recent cloudbursts in the Redlands-Crafton (Cal.) district demonstrated that oiled roads will stand up under the heaviest pressure. In that vicinity there are numerous oiled roads, and, whereas the unoiled roads were badly washed and made unfit for travel, the former came out of the rush of waters as clean as a floor, and in nowise injured. One of the principal tests is Colton avenue, where the flood was so strong as to sweep away a bridge, but even the embankment left after the bridge had gone down stream was intact—the oil preventing the water from even undermining the roadbed.



Welch Goes With Diamond.

Eugene Welch, formerly with the Boston Woven Hose & Rubber Co., has joined the Detroit staff of the Diamond Rubber Co.

National's Striking Car.

A number of important detail changes have been made in the 1905 National gasolene car, made by the National Motor Vehicle Co., Indianapolis, Ind., an excellent reproduction of which is here given. As will be seen, the most striking feature is the adoption of a circular radiator, used in conjunction with a similarly fashioned bonnet, the two together giving the car a decidedly original and pleasing appearance, especially when viewed head on.

NATIONAL TOURING CAR FOR 1905.

The car is of the popular side entrance tonneau type, with roomy and luxurious seats both front and back. The use of a wheel base measuring 100 inches gives ample space for the fitting of the side entrance. As was the case with the 1904 National, the power plant consists of a four-cylinder vertical engine, mounted in front, but the cylinder dimensions have been increased from 3¾x4 inches to 4¼x5 inches. With this increase the engine develops a full 20 B. H. P. The engine is now set lower on the chassis, and the crank shaft, gears and propeller shaft are in line with the rear axle, insuring a marked economy in the transmission of power.

One Building for Many Stores.

Plans are being drawn for a large structure to be erected by the Perry-Payne Co., Oregon street, Cleveland, Ohio, to be used as automobile stores and garages.

The building will be one-story high and of fireproof brick, steel cement and wire glass construction. It will be 500 feet long and will extend from the south side of Power street to a new street and from Muirson street to a new street extending from Power to Oregon, between Muirson and Erie streets. The structure will thus have streets on all sides and can, in this manner, be furnished with plenty of exits leading to paved thoroughfares.

The building will be arranged for the accommodation of all manner of enterprises devoted to the manufacture, sale or handling in any capacity of automobiles. The structure will be arranged in ten sections of fifty feet each, but the dividing partitions will not be placed until the tenants have made definite plans as to space required.

The Remodeled Mitchells.

Two entirely new models are being prepared for the 1905 market by the Mitchell Motor Car Co., Racine, Wis., both of them water cooled. One of them, the two cylinder car, is ready now, and the first of the type has been received by the New York agents, the Duerr-Ward Co. The other, which has four cylinders, will be ready just after January 1.

REMODELED MITCHELL RUNABOUT.

As the illustration makes plain, the new two cylinder car is of pleasing appearance and thoroughly modern design. It is rated at 9 horsepower, and lists at $750. As it will eventually be marketed, the car will be driven by a vertical engine having two 4x4½-inch cylinders. The frame will be of pressed steel, with a 78-inch wheel base and a 54-inch tread. The transmission is by sliding gears, giving three speeds forward and a reverse, all actuated by one lever. The control is by sparking advance and throttle, operated by levers mounted on the steering post; wheel steer, irreversible, is employed. The cylinders are water jacketed, the circulation being effected by a gear driven pump, insuring positive action of the water. A float feed carburetter of the spray type is used, and the lubrication is effected by pressure feed. Divided seats are fitted, and ample luggage capacity is provided. The weight of the car is 1,050 pounds.

The four cylinder model also has cylinder dimensions of 4x4½ inches, developing 16-18 horsepower, and the wheel base is lengthened to 88 inches and the tread widened to 56 inches. A bevel gear and shaft drive is employed in place of the ½-inch Whitney chain used on the light car. The price is $1,350 and the weight 1,400 pounds; otherwise the specifications of the two cars are identical.

Harrolds's New Home.

Freed from the hands of the painters and decorators, who have been working industriously to embellish the handsome salesroom at Broadway and Fifty-ninth street, New York, the Harrolds Motor Car Company is this week moving into these quarters. Both the Broadway and Fifty-ninth street fronts are plate glass, with striking lettering on each, "Olds and Arrow Motor Cars," with "Harrolds Motor Car Co." in smaller letters underneath. The premises consist of one large, lofty ceilinged room, with two entrances on Broadway. It will be used as a salesroom exclusively. No demonstration or other cars with filled supply tanks will find a place on the floor, the lease prohibiting the presence of gasolene in even small quantities. The floor will be devoted entirely to the display of new Olds and Pierce cars, and the entire establishment will be arranged in keeping with this plan.

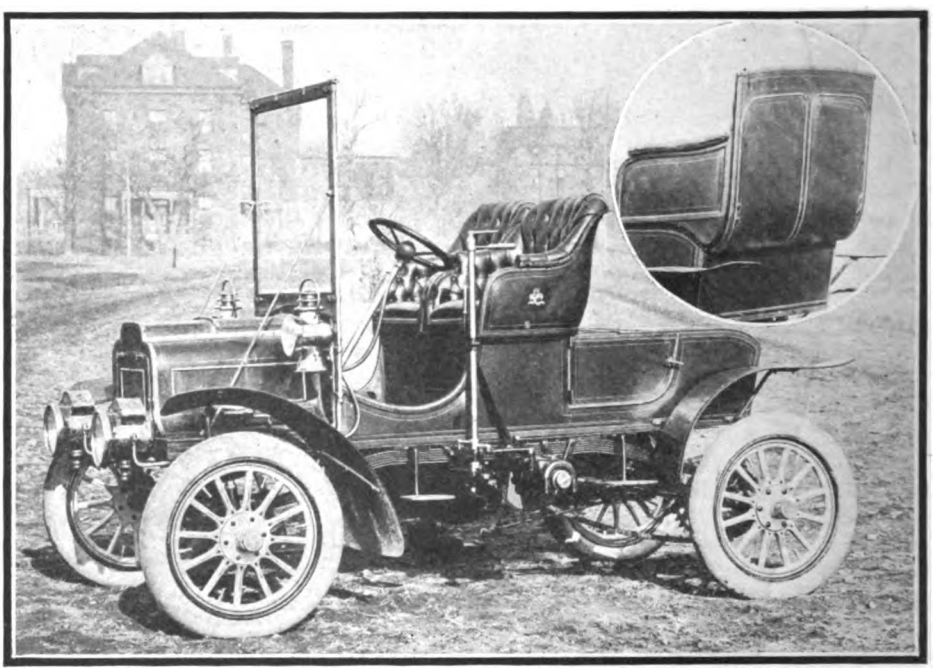
KNOX'S NEW LINE

Many Notable Changes Made, Both in Appearance and Mechanism.

In addition to the side entrance tonneau and the folding rear seat surrey exclusively described in the Motor World of December 1, the Knox 1905 line will comprise an F1 runabout, the latter conforming closely to the lines and specifications of the 1904 runabout. How the enterprising Springfield concern has wrought an immense improvement in the construction and appearance of these cars, while retaining most of the time tested Knox specialties, will be readily seen from an examination of the accompanying illustrations and description.



KNOX TOURING CAR.

Below are noted the important improvements in the line:

Inclosed crank case; pistons, connecting rods, transmission and all important parts may easily be removed and taken apart without disturbing the body; spiral gears inclosed; transmission exceptionally quiet, and will run all day with one oiling; automatic mechanical oiling of all principal bearings by force feed; large thrust collars for high speed clutch; improved adjustment between rocker and exhaust valve stem; a muffler connection allowing expansion and contraction without disturbing other parts; nickel steel rear axles; fans run on ball bearings; and idler is eliminated; igniter more accessible and improved in details; atomizer mounted on crank case in very accessible position; automatic auxiliary valve; aluminum dress guard around high speed clutch; clutch absolutely noiseless and smooth working; apron under motor.

The two entirely new models—the F tonneau and the F3 surrey—have been materially reduced in weight, they now scaling 2,000 and 1,950 pounds, respectively. Except in body design, wheel base, weight and price the two cars are identical. One has a side entrance tonneau, roomy and of graceful design; the other is designed to carry either two or four passengers, an ingenious folding rear seat with cushioned back and sides being provided, so constructed that it folds out of sight. The side entrance car has a 90-inch wheel base, whereas the surrey's base is but 87 inches.

KNOX SURREY, WITH FOLDING REAR SEAT.

KNOX RUNABOUT.

The well known Knox double opposed air cooled engine, centrally located and with cylinder dimensions of 5x6 inches, developing 14—16 horsepower, form the power plant. Either wheel or lever steering is fitted, and two speeds and a reverse are supplied. The wheel are 30 inches, fitted with 4-inch tires. Jump spark ignition from dry cells is employed, and a single chain drive with planetary transmission is used.

The price has been fixed at $1,900 for the side entrance and $1,750 for the surrey, this being an advance of $50 in each case over the prices at first announced. Tops are furnished at an advance of $100 to $115, and glass fronts for $50 extra. The cars will be supplied in carmine, green or blue finish.

The F1 runabout has a folding front seat, a wheel base of 81 inches, 30x4-inch wheels, and either wheel or lever steer. Otherwise the specifications are identical with the two models already described.

First Marion Reaches New York.

Homan & Schutz, the local representatives of the Marion Motor Car Company, Indianapolis, Ind., are as proud as the proverbial peacock over the appearance of the first 1905 Marion air-cooled car. It is a handsome vehicle and of approved modern design, being of the side entrance type, with long wheel base and an amplitude of room.

The engine is the familiar four-cylinder, vertical, air-cooled type used by the concern this year. It is rated at 14-16 H. P., and the car weighs 1,650 pounds, and lists at $1,500. A few detail changes have been made from last year, notable among them being axles of increased size and strength.

H. E. De Loura, formerly of Fort Dodge, Iowa, is now in San Diego, Cal., which place he considers an eminently suitable location for an automobile factory. He was formerly in the same business at Fort Dodge.

FREEZING PREVENTIVES

The Effect of Alcohol and Glycerine—How Chemical Salts do Damage.

"In dealing with the results of my experiments with anti-freezing mixtures and recommendation of alcohol-glycerine," writes Harry Souther, "one important fact was omitted, in that I did not state that wood alcohol affected the rubber connections of the cooling system to a very slight degree. One entire season with a 33 per cent solution affected the rubber so little that after close examination with a knife and by tearing the inner lining of the hose I was not sure that there had been any change. Certainly there was nothing that had effected the hose in any great degree.

"Glycerine does soften the rubber, but any ordinary hose will stand a year in the presence of it, possibly longer. The glycerine, alcohol and water mixture affects it to a very slight degree in the proportions given in my diagrams published by the Motor World.

"The right way to handle the mixture is to find out the equation for your own car, using all the alcohol you can possibly stand and not boil the mixtures on the mild days sure to be met with in winter in this climate. Some machines will stand all alcohol—that is mixed with water—others will not, and glycerine must be used to keep up the boiling point.

"Any number of chemical solutions are advertised in the market. It is quite possible that all of them will prevent freezing; I am not able to say to the contrary. One thing must be remembered, however, and that is every salt dissolved in water forms an electrolyte through which electric currents pass with the greatest readiness. Unless the entire system of water cooling surface is of exactly the same metal one or the other of the different metals is sure to dissolve. A cooling system may last a year or two, but, sooner or later, the fatal results of electrolysis will be felt and some part of the system will disintegrate. These remarks apply to every chemical soluble in water that can possibly be used to advantage as far as lowering the freezing point is concerned. It is also a not unusual experience to discover that some of the anti-freezing chemicals have left a plaster-like deposit in the bottom of the tanks that finds its way into the pipes or tubes and actually cakes therein."

The Price of Bodies.

Referring to charges made that Paris coachmakers charge excessive prices for bodies when they are to be used with automobiles, one of the latter has this to say:

"Such a statement is entirely misleading. In coachwork, as in other things, there are different qualities to suit all purses. The leading coach builders only turn out one class of work—the best, and customers who go to the best coach builders know what they will have to pay.

"There is no exaggeration in their estimates for the work they produced. It is no use judging by the prices for horse drawn vehicles. Personally I would prefer to make two horse drawn carriages rather than one automobile body, for the simple reason that an automobile body had so much work upon it, in the matter of fitting, etc., which might not be apparent to the inexperienced eye, but which could easily be recognized by the expert."

How He Saves the Tires.

An adjunct of the local Winton establishment is a garage in Fifty-fourth street, just west of Broadway, where the cars are kept on "dead" storage through the winter. As giving an instance of the infinite pains taken there, a course pursued to prevent tire deterioration is interesting.

"See those jacks?" queried Manager Percy Owen, of the branch, one day this week, directing the Motor World man's attention to a workman who was walking over to the garage with a pile of the jacks referred to on each shoulder. Receiving an affirmative reply he went on:

"We put them under each car laid up for the winter. Two go under each axle, and raise the car an inch or two from the ground. Thus the tires are relieved of all weight, and kept from contact with the ground. This means a lot in the way of keeping them from injury."

The jacks referred to were simply wooden stands with four legs, the latter being cut the proper length for a Winton car. Two of them are placed under each axle, near the wheels.

The Use of White Lead.

White lead—the pure lead ground impalpably fine—has a body, covering power and a surfacing property, taken in connection with a fine, soft texture and a density of fabric, which makes it unsurpassed by any known pigment. It is probably distinguished from all other pigments by the ease with which it mixes with oil and for its free, easy working properties under the brush. While white lead must yield in point of elasticity to the red, it, at the same time, holds a place in the front rank as a highly elastic pigment—not only elastic, but wonderfully tough and sinewy in film and body, with a surface par excellence for leveling and smoothing for succeeding processes.

Stage Line in British Columbia.

An automobile seating twelve persons is to be part of the equipment of the stage line between Greenwood and Phœnix, British Columbia, next spring. J. F. Royes, who runs the stage line between Greenwood and Grand Forks, expects to put the automobile into service when the Great Northern Railroad begins running its trains into Phœnix.

TO TEST ELECTRICS

Contest Arranged for Next May—What it is Proposed to Bring Out.

So great has been the increase in the number of electric vehicles in Paris that Le Velo is organizing a reliability trial for electric vehicles, which will take place in Paris in May of next year. The competition will be directed to deciding the merits of the vehicles for town and suburban service, and will take into consideration, in addition to ascertaining this important point, the cost of upkeep per day for the distance run, the relative comfort, ease of control and silence of the vehicles, and the price. There will be three categories, or classes, as follows:

Class 1—Two seated vehicles; maximum weight 1,300 kilograms.

Class 2—Four seated vehicles; maximum weight, 1,500 kilograms.

Calss 3—Six seated vehicles, with luggage carrier, to take 30 kilograms per passenger; maximum weight, 1,800 kilograms.

All classes may have either open or closed bodies, or bodies which may be opened or closed at will, but they must all be completely upholstered as usually fitted. The weight limits are those of the vehicle in running order. Vehicles must have at least one double acting brake, and also a sprag. The entries are not limited, but no manufacturer may enter two vehicles of similar type and dimensions. Entries close on May 1, 1905.

The trials will consist of daily runs of 100 kilometres about Paris or its suburbs, returning each evening to the charging station, and will last for eight days.

About Wheels and Bodies.

"There are two important parts of the automobile that can never cheapened," remarked an Eastern travelling man the other day to a Motor World man. "I refer to the body and the wheels. On the contrary, they will cost more instead of less.

"Wood suitable for wheels and bodies—and especially the former—is becoming scarcer and costlier every day," he continued. "We now have to go South for a considerable part of the lumber we are using, as it becomes more and more difficult to get it from the northern forests, which have been our source of supply for years. So you may set it down that, whatever other parts of the automobile may cost, the bodies and wheels will increase in price."

"Unless we discover a substitute for wood," interposed another tradesman. "If we made wheels and bodies out of steel or some other metal—as a few makers do now—we should do away at one stroke with the necessity for using wood and increasing price."

Montreal now has sixty licensed automobiles, twelve of them being business vehicles.

BLISTERS ON FINISH

Some of the Things That Cause Them and How They May be Avoided.

When the Liveryman, the Carriage Builder and the Boss Painter next resumed conversation, the Liveryman was in trouble over a newly painted and finished cabriolet, the varnish upon which had during the last summer blistered upon the back panel and one of the side panels," says the Carriage Monthly.

"This was a new job, just out of the factory," said the Liveryman, "and as it came from a firm of high standing I can't understand the cause back of the trouble."

"Why not call it a case of unseasoned wood and free the painter from any imputation which might be attached to him in connection with the matter?" chirped the Carriage Builder interrogatively, with a look full of suggestion shot straight at the Boss Painter.

To which the latter made rejoinder: "With due allowance for my friend the Carriage Builder, who invariably refuses to recognize his own chickens when they bravely return home to roost, I may as well reiterate what has often been said before—that blistering of the varnish is due principally, although not always, to unseasoned wood and to moisture sealed up in the rough stuff coats."

"But what causes this moisture to develop the blisters?" queried the Carriage Builder. "Certainly not the sun's rays in all cases, for I have observed blistering on varnished surfaces that had never been exposed to the direct heat of the sun."

"Oh, no; not always the sun's heat is the cause of the blistering," replied the Boss Painter; "but in the great majority of instances it is. Heat is the cause always, but an overheated repository has been known to develop blisters upon the surface of varnish."

"But, in my time, as a paint shop inmate," interposed the Liveryman, removing an unlighted cigar from his mouth with the air of a man who is getting much enjoyment from a dry smoke, "I was taught that blistering is never seen unless there is excessive heat."

"Which, in the main, is true," answered the Boss Painter approvingly; "but there are exceptions in all cases of phenomena. It is generally understood, and experience confirms the belief, that the blistering of a varnished surface after the varnish has had ample time to dry thoroughly is due entirely to the evaporation of moisture which lies confined under the varnish. It matters comparatively little whether the moisture comes from the wood direct or from the coats of rough stuff, heat will bring the confined moisture close up under the film of varnish, and the direct and intense heat of the sun softens the varnish to such an extent that the evaporating moisture underneath forces the garment of varnish into what we painters call puff balls. Now, a highly heated repository or carriage house may not cause a similar condition of the varnish to ensue so promptly. I have noted, however, some cases of varnish blistering due to a high and uniformly sustained room temperature."

"Such instances are not likely to occur unless a very large percentage of moisture is present in the structure of paint and varnish," added the Liveryman contemplatively.

"That would depend upon the grade of varnish, perhaps," suggested the Carriage Builder.

"A varnish that dries quick and hard would be practically proof against the heat of a repository, however high it might reach."

"In such a case, what would become of the confined moisture?" questioned the Liveryman eagerly.

"Why, the moisture would affect the varnish and circulate underneath it until around mouldings and joints it would find an exit, thereby breaking up the solidity of the surface at those points where the strain is greatest," answered the Boss Painter.

"You spoke a moment ago," said the Carriage Builder, "of moisture in the rough stuff coats causing blister. Why not some of the other coats?"

"The moisture in the rough stuff," replied the Boss Painter, picking up a ladle used for mixing rough stuff and cutting with his knife at a sharp angle into the accumulation of pigment, and then holding a microscope over the gashed portion, "is full of small pores, or tunnels—I call them pipe lines—as you will note under the glass, and during the work of rubbing the stuff with black pumice stone or brick and water these tunnels absorb and carry a surprising quantity of moisture. Unless the surface, after rubbing, is set aside to dry twelve or fourteen hours in a warm room before it is coated with the color, the moisture is likely to be very largely sealed under the color and later under the varnish."

"In a warm room, then, say heated at a temperature of 65 or 70 degrees, the moisture will quite all evaporate in the time you mention," suggested the Liveryman, questioningly.

"It will evaporate from the ordinary quick rough stuff in that time," retorted the Boss Painter, "but perhaps in case of English filler or of American filler, with which an unusual amount of white lead is mixed, an extension of time should be granted."

"But such rough stuff will not absorb moisture as freely as the quick drying kind," advised the Carriage Builder.

"Neither will moisture evaporate from it so quickly," responded the Boss Painter."

When black smoke issues from the exhaust it means that too rich a mixture is being used. The supply of gasolene entering the explosion chamber should be lessened. On the other hand, if the smoke has a blueish tinge, it is a sure sign that lubricating oil is being burned.

HERE'S THE SNOW CAR

Evolved in the Head of a Worcester Man and has "Beauties" all its Own.

A Worcester, Mass., man proudly proclaims himself the "snow conqueror," and asserts that an invention of his will "relieve the automobile from the thraldom of winter and the ice king, and make the use of the automobile in winter as common as it is in summer." All this in face of the naive admission that the lack of snow has hitherto prevented the trial of his device!

Robert Staake is the optimistic inventor, and he has filed application papers which he hopes will result in the grant of a patent to him. Pending this grant he is reticent, but to a local newspaper man unburdened himself of these details concerning the vehicle he has "invented."

The car is mounted on runners, which are such a distance from the body of the car, or from the axles, that the wheels, which are left on the car as usual, do not touch the ground. The car is driven by the revolutions of two sprocket wheels, which are armed with sharp spikes, which penetrate the earth or ice, and as they revolve force the car along on the runners. This part of the invention is not novel in itself.

What Staake considers the essence of his invention is an arrangement by which by the simple turning of a wheel or pulling of a lever the wheels may be made to come in contact with the earth or ice, and thus the car will run across spots which are barren of snow or ice.

The inventor considers that his invention will enable an automobile to be run at a high rate of speed, if desired, across the snow covered country, and that it will relieve the difficulty which would otherwise be encountered when patches where the wind has swept the snow from he roadway are met with.

One of the chief beauties of his invention, he says, is that the wheels and the runners are bi-auxiliary—that is, either may be made auxiliary to the other at a moment's notice. The motive power which drives the sprocket wheels is the same as that which drives the ordinary wheels, and the inventor claims that its transferrence fror one set to the other is so simple that it is a matter of little moment.

The invention is the culmination of about three weeks of strenuous mental and mechanical endeavor on the part of Staake. Several times he though that he had satisfactorily solved the prolem, only to find a flaw which necessitated new planning and different methods.

French makers do not propose to lose the opportunity to score i the forthcoming test in India. Two of them, the De Dion and the Richard-Brasier, hav already sent cars to India to compete, and Darracq, Clement-Bayard and others expect to be represented also.

The Week's Patents.

776,542. Carburetter. Francis Paul, jr., Sorel, Canada. Filed August 7, 1903. Serial No. 168,686. (No model.)

Claim—1. In a gas impregnator, an impregnating float comprising a horizontal plate having a peripheral depending flange, one or more concentric depending partitions on the lower side of said plate, and a plurality of radial partitions dividing the spaces between the concentric partitions into a series of compartments with portions cut away, the height of some of said partitions being less than that of the others, whereby gas delivered under one of the central compartments is caused to pass successively through the others to one of the outer compartments.

776,557. Electric Transmission Mechanism. Charles G. Simonds, Schenectady, N. Y., assignor to General Electric Co., a corporation of New York. Filed May 5, 1904. Serial No. 206,494. (No model.)

Claim—1. In combination, two relatively movable shafts in line with each other, and a dynamo-electric machine having its field carried at the extremity of one shaft and its armature carried at the extremity of the second shaft, said field having a web extending around said armature and forming a bearing for said second shaft.

776,561. Automobile Driving Gear. Peter Steinhauser, St. Louis, Mo. Filed March 10, 1904. Serial No. 197,577. (No model.)

Claim—1. In an automobile driving gear, front and rear axles, means for imparting rotation to the same, a coupling pole connecting the front and rear trucks, a pair of screw shafts on the vehicle, means for rotating said shafts, nuts travelling along said screw shafts, and intermediate connections between said nuts and front axle for deflecting the latter upon rotation of the shafts in either direction, substantially as set forth.

776,650. Pneumatic Tire. Charles E. Duryea, Reading, Pa. Filed January 16, 1904. Serial No. 189,297. (No model.)

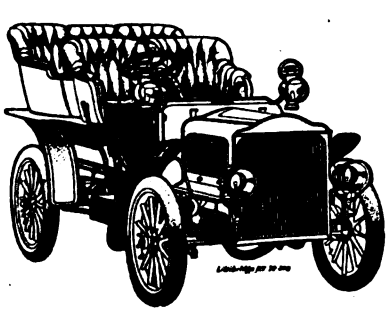
Claim—1. In a pneumatic tire, a retaining shoe, having an airtight inner wall and thickened edges, in combination with a wooden felly having inclined surfaces upon which the said inclined edges bear, an iron rim shrunk thereon and a suitable clamp and oppositely disposed means engaging a common device in said felly for binding the edges of the shoe against the said iron rim and drawing said edges downward against said inclined surfaces to form an airtight joint.

776,656. Tire. Charles G. Fawkes, Denver, Col., assignor to the Fawkes Rubber Co., Denver, Col. Filed September 19, 1903. Serial No. 173,911. (No model.)

Claim—1. A cushion or pneumatic tire formed of layers of canvas and rubber and provided with external recesses formed in its inner periphery, and interior protuberances corresponding in degree and coinciding as to position with the external recesses.

776,700. Sparking Device for Internal Combustion Engines. Charles E. Sterne, San Diego, Cal., assignor to Sterne Bros. Co., San Diego, Cal., a corporation of California. Filed May 2, 1901. Serial No.. 58,530. (No model.)

Claim—1. In a sparking device, the combination with electrodes which are normally out of contact, of a rocker arm for causing a contact, the free end of which is perforated and provided with a concave seat on each side, a shouldered rod projecting through said perforation, convex clamping means, one on each side of said arm, one of them being rigid and the one between the shoulder and arm being movable, a spring between said shoulder and the movable clamping means, said spring being strong enough to return said parts to their normal position by pressure upon said clamping means, a guide for supporting the free end of the rod, and means for moving the rod longitudinally.



776,705. Induction Coil. Richard Varley, Providence, R. I., assignor to Varley Duplex Magnet Co., a corporation of New Jersey. Filed December 30, 1903. Serial No. 187,199. (No model.)

Claim—1. The combination with an induction coil, of a plurality of vibrators therefor and a switch for throwing any one of them into circuit at will.

2. The combination with an induction coil, of two vibrators constantly subject to the

The Incomparable WHITE

A speedy, luxurious touring car—renowned the world over for reliability. The automobile selected by a committee of the Automobile Club of America as a present for their retiring president.

Interesting descriptive matter free on request.

WHITE Sewing Machine COMPANY,
CLEVELAND, OHIO.

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builders have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of coolis worth something to our customers.

We are now shipping coolers on our 1905 orders.

Opposes Change in New Jersey.

That Assemblyman Scovell is not to get his proposed amendments to the New Jersey automobile law through the legislature of that State without encountering opposition is already apparent. The amendments which Scovell proposes to introduce permit the arrest of motorists without warrants, give municipalities the right to fix the rate of speed, and forbid the carrying of any numbers other than the New Jersey insignia.

Criticising the changes, the East Orange Record says editorially

"The question which the legislature of New Jersey wants to be considered, and which primarily should be considered by Assemblyman Scovel himself, is as to whether New Jersey wishes to withdraw from the position which it has taken on the subject of automobiling before the country at large.

"In the first place, what is the reason for the change? New Jersey has not suffered under the present law. Statistics show that there have been fewer accidents from violation of the law in the State of New eJrsey than in any other State where ther has been an equal amount of automobile traffic.

"Take the city of East Orange, for instance. There is no record within the limits of the city of an automobile accident which has resulted in a lawsuit or an issue in court, and yet East Orange was the first city to recognize the true interpretation of the automobile act that a violation of the speed limits was not a crime for which the automobilist could be arrested, but was a violation of a penal statute for which he could be summoned before a magistrate. This is precisely the English law of to-day.

"The understanding in the Police Department was that a man was not to be arrested unless an excess of speed prescribed by statute directly resulted in an injury to life or property. In other words, the automobilist was arrested upon precisely the same grounds as a man driving a horse or walking in the road would be arrested, viz., that by his disorderly conduct and his criminal negligence he caused injury to life or property.

"Under this correct interpretation of the law, and this proper administration of the statute, East Orange has been more than free from legitimate causes of complaint against the automobilist."

New Road to Lakewood.

The decision of the Atlantic County, N. J., Board of Freeholders to build a new road from Hammonton to the Burlington County line near Atsion, from which point there are good roads to Trenton and Lakewood, thence to Jersey City, assures a new auto route. The new course will cut two miles off the New York route, and vary the monotony of the journey for Philadelphians.

The road is one of several important highways to be built at public expense during the coming year. The county board has definitely decided to build the proposed boulevard, 100 feet wide, along the edge of the mainland from Absecon to Somers Point, at a cost of $50,000, and to expend about $25,000 more on new gravel highways from Chestnut Neck, through Galloway Township, to Cologne, on the Atlantic City Railroad, and also from English Creek, in the lower section of the county, to the golf course at Northfield. Another important connection in the highway chain will be a drive from May's Landing, the county seat, through Downstowns and Buena to the Cumberland County line, thence to Bridgeton and Vineland.

Iowa Organizes a State Club.

Starting off with a membership of more than fifty motorists, the Iowa Automobile Club was formally organized last week at Des Moines, Iowa. The following officers were elected: President, George B. Hippee; first vice-president, D. B. Fleming; second vice-president, Captain W. J. Riddell; secretary, F. L. Kern; treasurer, Charles Denham; consulting engineer, F. S. Dusenbury; executive committee, L. Aulman (chairman), E. J. Wilkins, W. P. Henry, G. B. Hippee and F. L. Kern. The principal object of the club is to further the good roads movement, and it will co-operate with other organizations to secure legislation for the improvement and maintenance of the public highways.

The club will try to have rational State laws passed providing proper rules and regulations for the use of automobiles in cities and the country, and it will do its best to protect motorists from unreasonable legislation. The club will also interest itself in organizing tours, exhibitions and contests. Local members will pay $5 initiation fee and $2 yearly dues. Outside clubs admitted to membership will pay 25 cents initiation fee for each member and a like amount for yearly dues. The Governor of the State, the Mayor of Des Moines and the members of the county Board of Supervisors and the Board of Public Works are to be honorary members of the organization. The club will be affiliated with the American Automobile Association.

Wants Lights on All Vehicles

The Worcester (Mass.) Automobile Club will try to have a law passed by the State legislature compelling all vehicles to carry lights after dark. Formal action was taken at a meeting of the club last week, when the following resolution was unanimously adopted:

"Resolved, That it will be for the welfare of every driver of any kind of a conveyance that every vehicle travelling after dark should be provided with lamps, whether milk wagons, carriages or automobiles, for the safety of every one using the highways after dark."

France Names Vanderbilt.

W. K. Vanderbilt, Jr., has been named by the Automobile Club of France as its representative on the commission in charge of the competition for the Charles J. Glidden touring trophy.

Massachusetts Club "Warms" Its House.

Although the addition to the clubhouse of the Massachusetts Automobile Club, Boston, has been in use by the members for nearly six months, it had not been properly "warmed" until last Friday evening. The addition, which is twice the size of the original clubhouse, was completed last July, when the Boston section of the St. Louis tour started, and as many of the members were out of town at that time it was decided to wait until winter for the formal dedication.

Nearly one hundred members and guests assembled in the rooms at 6 o'clock and started the housewarming with a dinner, and, remarkable to relate, "beans" were not on the menu. Elliot C. Lee, president of the Massachusetts Automobile Association, was seated at the head table, and with him were Harlan W. Whipple, of the A. A. A.; Asa P. Goddard, president of the Worcester Automobile Club, and Police Inspector Smith of New York.

President Lee led the speechmaking, and spoke of the growth of the club and praised the spirit and enthusiasm of the members which had given Boston the first automobile clubhouse in the country. President Whipple said that the Massachusetts club had set a good example, and one that the Automobile Club of America, in New York, has decided to follow in building a clubhouse and garage combined. After the speechmaking the guests were entertained by a glee, mandolin and banjo club concert and by a quartet.

The enlarged clubhouse has a frontage on Boylston street of 113 feet, and a depth of nearly 100 feet, and is three stories high. The social rooms occupy the second floor of the old part of the house, and the repair shop is on the third floor. There is an office for the superintendent and a ladies' waiting room on the ground floor, and a chauffeaus' room is on the second floor. The remainder of the three floors and the large basement is used for storing cars, those in constant use occupying the street floor and the others are stored on the floors above, as they can readily be brought down on the automobile elevator. There are accommodations for two hundred cars.

Blackinton Gets the Cup.

B. F. Blackinton has been formally declared the winner of the Knight Cup, which was the grand prize in the annual hill climbing contest of the Rhode Island Automobile Club, held at Providence on November 26. As was told in the Motor World, Blackinton's car made the fastest time in the regular events, though Harry Martin's Peerless bettered the time by one and four-fifths seconds in running off a tie with the Pope-Toledo entered by W. J. Foss. Martin entered a protest at the time, and it was considered later by the committee in charge of the contest. The committee ruled that the contest was decided before the tie was run off, and accordingly awarded the trophy to Mr. Blackinton.

Are your eyes bothering you? Do they ache and pain you? Do they look red and feel hot? Are you troubled with headache and neuralgia? Does it hurt you to read or sew, or use the eyes steadily?

Then don't waste another hour, but get EYE-FIX, the only sure and painless cure for all eye troubles. It never fails to give instant relief, and as it contains neither cocaine, atropine, belladonna or other dangerous elements, EYE-FIX is used universally by physicians and opticians.

EYE-FIX is good to keep the eyes well and strong. And it's the one safe remedy for every eye trouble in both young and old.

If baby's eyes are weak or sore—use EYE-FIX.

If grandfather's eyes are weak and weary—use EYE-FIX.

If your own eyes are bad from any cause—use EYE-FIX.

All druggists and opticians sell EYE-FIX at 50 cents. Ask for it and take no substitute. No other eye remedy in the world is like EYE-FIX, because no other remedy produces the same splendid results as EYE-FIX. A trial bottle for 10 cents will be sent you direct from our laboratory. Eye-Fix Remedy Co, Detroit, Mich. Dept. S.

magnetic attraction of the coil and a switch for determining which of the vibrators shall control the circuit of the coil.

776,708. Valve Gear for Explosive Engines. Charles H. Way, Lansing, Mich., assignor to Clarkmobile Co., Lansing, Mich. Filed December 28, 1903. Serial No. 186,866. (No model.)

Claim—1. In a gas or vapor engine, the combination of a main cylinder having suitable inlet and exhaust ports; a main piston, a suitable inlet valve, an auxiliary cylinder connected to said main cylinder by a passage or port, said passage or port being so arranged that it is connected to said main cylinder when the main piston is in its outer position, and to the outer air when said piston is in its inner position; a piston in said auxiliary cylinder, a piston rod therefor, an exhaust valve on said piston rod, of a diameter less than that of said auxiliary piston, a spring for returning said auxiliary piston to its initial position, a passage through said exhaust valve and piston rod by which said auxiliary chamber is connected to the main chamber when said exhaust valve is open, said passage being sealed by the closing of said valve, and a port for said auxiliary cylinder whereby the outer face of said auxiliary piston is subjected to atmospheric pressure, for the purpose specified.

776,982. Carburetting Apparatus for Explosive Engines. Joseph D. Anderson, St. Marys, Ohio. Filed January 4, 1904. Serial No. 187,654. (No model.)

Claim—1. In a carburetting apparatus, the combination of an engine cylinder, an exhaust pipe leading therefrom, a vaporizing chamber heated by said exhaust, an oil delivery pipe entering the vaporizing chamber through the exhaust passage, a gas outlet pipe leading from the vaporizing chamber to the engine, a reheating chamber inserted in said outlet pipe between the vaporizing chamber and the engine, said reheating chamber surrounding the exhaust pipe at a point between the vaporizer and the engine, whereby the exhaust will first heat said reheating chamber and then the vaporizing chamber.

Carriage Makers Heed the Signs.

Having put out a horse drawn vehicle with tonneau body, carriage builders are now incorporating "automobile seats" in their models. These are merely the seats with swelling sides and backs, such as mark automobile seats of the Roi des Belges type. Evidently the carriage people deem it necessary to do something to stay the side, as no less than three bodies of this sort are illustrated in a recent number of the Carriage Monthly.

"It would be pretty hard to keep posted without The Motor World."

That remark correctly "sizes up" the situation.

Even the Motor World's rivals admit the truth of it.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—Winton quad. In best condition, with four hundred dollars worth of extras on it. Very best reason for selling. It will pay you to investigate, if you are comtemplating buying an automobile at a bargain. Address, Room 403, First National Bank Building, Danville, Ill

FOR SALE—1904 White Touring Car with top, gas lamps and side baskets. Car guaranteed first class shape; $1450 00. Reason for selling—buying 1905 Model "White." Address T. W. J. SUITE, 23 Manhattan Blk., Cleveland, Ohio.

WANTED—Fifteen to twenty traveling salesmen by a well-known and established tire manufacturing company, making standard goods. Only active men who know how to work effectively and all the time need apply. Exceptional opportunity for men of the right sort. Address, TIRES, P. O. Box 649, New York.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

SALESMAN.

A machine salesman, age 30, with 7 years' experience, 3 years with automobiles, desires position. Address E. N B., care Motor World.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 28 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

OLDSMOBILE
Proclamation No. 2.

Mr. Buyer:

We ought to know how to build the best automobile of to-day. We have had 20 years' experience, have built more machines than any other maker in the world, and have the largest factories. The crowning triumph of up-to-date American automobile construction, the **100 per cent. plus** of Oldsmobile excellence, is our new

20 H. P. TOURING CAR.

$1400

Here is what we give you at the price:—

SPEED—6 to 40 miles per hour. Has surprising ability to climb hills on high gear.

BODY—Side entrance, heavily upholstered, hand buffed leather.

SEATING CAPACITY—Five passengers. Wheel base 90 inches.

RADIATOR—Honeycomb cooler—unsurpassed for efficiency.

MOTOR—Double opposed, 20 H. P.—cylinder 5¼ x 6 in. Simplest construction. All parts readily accessible. Valve mechanism above cylinders, away from dust and mud. Both valves mechanically operated, Noise of exhaust completely eliminated.

Do you want the discomfort, small power, breakages and trouble of the cheap tonneaus,—the complication, chauffeur and difficult adjustment of the four-cylinder cars? We think not. You want extreme comfort, a side entrance, surplus of power on hills and speed on the level, simplicity of construction, and that well-known Oldsmobile reliability.

It is yours at $1400.00, January Delivery.

Write us or our agents for further information, and place your order early.

GOODRICH TIRES

last through a season of hard racing and still in good condition.
Other tires on the same tracks were barely good enough for one heat.
Racing tires must be of the strongest construction. All GOODRICH tires are racing tires.

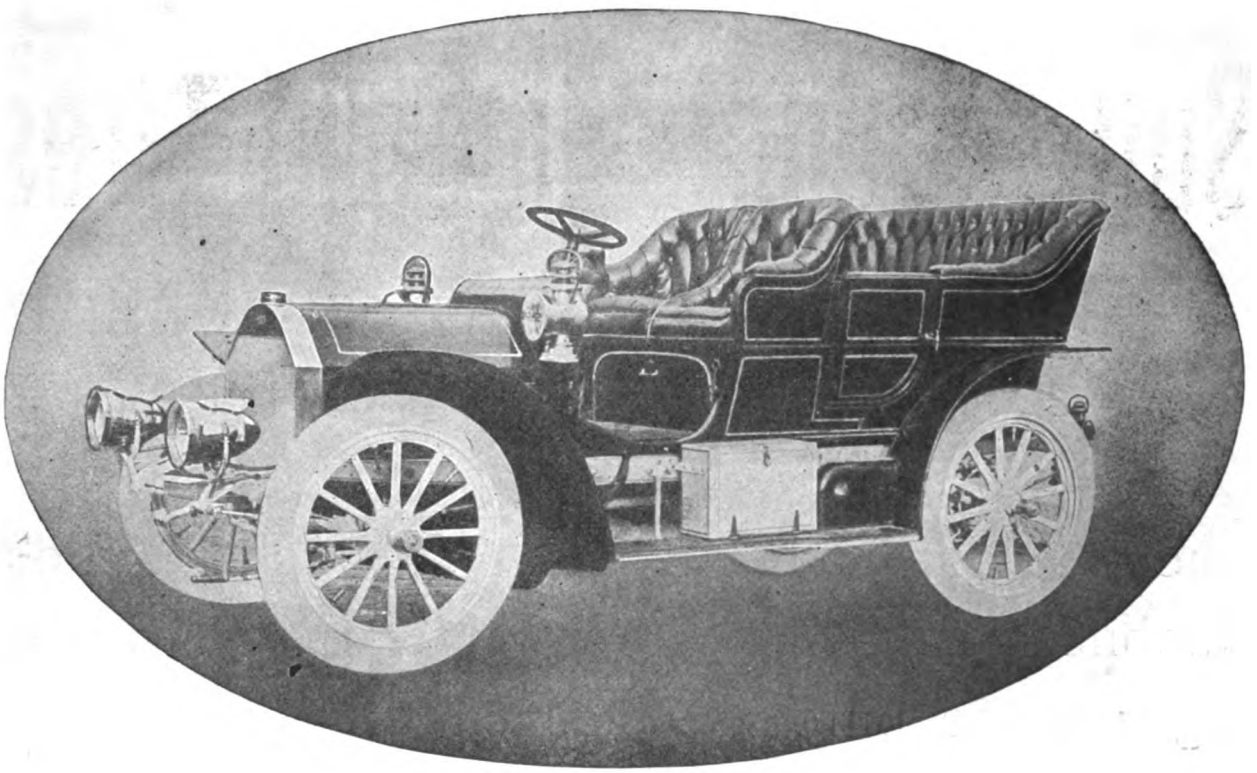
The B. F. Goodrich Co., Los Angeles, Cal. Oct.6,1904.

Akron, O.

Dear Sirs:-

I am indeed glad to place myself on record as an ardent advocate of your Goodrich Clincher Tire with which I have had four years experience in direct competition with other makes of tires and I truly believe them to be absolutely the best clincher tire on the American market today.

I used a set of Goodrich tires which had been put on my machine at San Francisco in November 1903 and which tires I used for three days hard racing at Ingleside where the car won its first race over Barney Oldfield; it was then shipped to Los Angeles and did two days hard racing here giving Oldfield a hard chase for his money on two occasions; the same car was used nearly every Saturday during the summer and then shipped to Del Monte where it raced two days fast racing winning the two open events with every mile better than 1.04; it was then shipped again to Los Angeles and I can truly say that these tires are still in good condition and ready for more fast work at the coming meet Oct.21st. These tires have never once had a pump put on them after being fitted to the rims at San Francisco last year. All other makes of tires were repeatedly replaced between races and heats at Del Monte; at least six times on one particular car where four different makes of tires were used, none of which I am glad to say were Goodrich.



Yours very truly,

WHITE GARAGE H. D. Ryus Mngr.

THE RECORD OF THE FORD.

Victory after victory is credited to the Ford light racing car. When you consider that this car gets its power from two of our standard type horizontal motors, you must admit it is proof positive of the correctness of the Ford design and construction for speed, strength and power. The Ford cars have established a record in every day use of consistent reliability and unvarying satisfaction.

MODEL B. Price, $2000.00. Henry Ford's Latest and Greatest Success.

A striking example of the distinctive Ford construction. Weight 1710 lbs. Four-cylinder vertical motor developing over 20-horsepower. This gives our car more power for its weight than any car of equal price in the world. Consequently there is less wear on the tires and ample reserve power for steep grades and sandy roads. Wheel base 92 inches, direct drive with universal coupling, cylinders 4x5 water cooled; automatic oiling devices with force feed, large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car places this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horsepower, planetary transmission, chain drive, and increased gasoline capacity. The most stylish low-priced car on the market.

SOME GOOD TERRITORY YET FOR LIVE AGENTS. WRITE US TO-DAY FOR FULL INFORMATION.

Peerless
The Car of Achievement

Former Records Fall Before the Peerless

At Sacramento, Dec. 4th, Chas. Burman, driving a 24-H. P. stripped Peerless touring car, established the following marks:

10 miles . . .	10:40
15 miles . . .	16:02 2-5
20 miles . . .	21:24 2-5
25 miles . . .	26:50

All the intermediate distances, from six miles up were covered in times considerably less than the former records. Furthermore, the reports of every race meet tell of the establishing of new world's records by the "Green Dragon."

The Significance of "Green Dragon" Records

Is that an engine identical with the one in this record-breaking car is placed in each 1905 model 50-H. P. Peerless car. An engine built on similar lines is in each of our new 24-H. P. and 35-H. P. cars.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

Veeder Mfg. Co.,
Hartford, Conn.

Gentlemen:—

We take pleasure in stating that we have equipped our entire product of STEVENS-DURYEAS the past year with your Odometers, and have not had a single complaint.

We have found your Odometers entirely satisfactory, and accurate. We shall continue to equip our runabout for the season of 1905 with same.

Very truly yours,

J. STEVENS ARMS & TOOL CO.,
AUTOMOBILE DEPARTMENT.
C. C. Hildebrand, Sales Mgr.

A bare car on which the purchaser must spend further time and money to supply deficiencies of equipment, is not as attractive as a complete, well-equipped car.

Veeder Odometers are properly a part of the regular equipment. Men want them on their machines. Our sales and re-orders show that.

Instead of trying to skin through with as little as possible in the way of equipment, assume an inexpensive liberality and supply Veeder Odometers. An odometer has a very great interest for the man who runs his own car, and when it is supplied, it conveys an impression of considerate forethought on the part of the manufacturer.

The cost of supplying Veeder Odometers is proportionate to the number of cars you sell, and is not a heavy fixed charge.

VOLIER HORNS.

Volier Horns

The **VOLIER DRAGON**: Double turns not only add to the beauty of the horn but by providing a longer vibration chamber or sounding board, produce a deep, swelling, powerful tone.

No other horn enjoys the high reputation that the **VOLIER** has earned. The non-corrosive reeds and the chemically cured bulbs have proved such superior features as to make the VOLIER the standard for motor car equipment. About 80 per cent. of all the cars made this year were equipped with VOLIERS.

Our New Model "C."

In view of the wonderful popularity of this Car, evidenced by the contracts already booked, we have decided for the present to abandon all other styles. Model "C" is the ONLY CAR we will build for the season of 1905.

DESCRIPTION—Side entrance tonneau with rear seat sufficiently wide to carry three people comfortably. Extra wide door (hinged in front), having perfect clearance and giving easy access. Planetary system of transmission. Six steel gears (no fibre or internal gears), two speeds forward, one reverse. Gear parts run in oil bath and enclosed in dust-proof case. Divided crank case permitting access to bearings without removing engine from chassis. Oil reservoir cast in crank case cover. Square fin continuous coil radiator. Raymond double acting band brake. Tilted steering column. Mechanical force feed multiple oiler. Splitdorf double spark coil. Clincher tires 30x3½ in. Laminated wood dash fastened to hood and entirely separate from body—permitting removal of body without disconnecting any of the wires or small tubes. Hood, French type, containing gasoline and water tanks. Gasoline tank holds 16 gallons, sufficient for 250 miles. Wheel base, 85 inches. Weight, 1,700 lbs. Finish, Royal Blue with fine Gold Stripe. Running Gear, Ivory White. Equipment, two No. 17 "Stay-lit" bullet lamps and tail light. Volier horn with screen and cable.

BUICK

Our Claims.

A 4½x5-inch double opposed cylinder engine, developing 22 B. H. P.

A car that will take any hill, "suitable or safe" for automobiling on high speed gear.

A "car of quality" as well as power—simple in construction—built for wear.

A car that can be operated almost exclusively on high speed gear—range of speed on high gear 3 to 45 miles per hour.

Our Performance.

At Eagle Rock, Thanksgiving, November 24, 1904. The phenomenal record made by a regular stock model "Buick" taken from the garage of Mr. H. J. Koehler, our local dealer, at Newark, N. J. The car used in this contest was not specially built or geared for Hill Climbing or racing, nor was it operated by a professional.

NOTE: — Many of the cars in this event were specially built and specially geared and driven by factory experts.

CARS.	PRICE.	H. P.	TIME.
Pope-Toledo	$3500	24	2.15 4-5
BUICK	**1200**	**22**	**2.18 2-5**
	Winner in its class over seven competitors in sensational record-breaking event. Former record by cars of this price, 4.13⅕.		
Mathewson	$5000	24	2.21 4-5
Thomas	3000	40	2.42 4-5
Columbia	4000	30	2.53 4-5
Franklin	1650	10	4.08 3-5
Rambler	1350	16	5.25 1-5

Referring to the above, it will be observed that we are using higher priced cars only for comparison. We respectfully refer you to official record for performance of lower priced cars.

BUICK

A Letter.

NEW YORK OFFICE
BUICK MOTOR COMPANY,
52 Broadway.

December 20th, 1904.

JAS. ARTMAN, President,
Cycle & Auto. Trade Journal,
Philadelphia, Pa.

Dear Sir: The statement made by your Mr. Arnold (writing under the nom de plume "Hugh Dolnar") in October, 1904, issue "Cycle & Automobile Trade Journal," to the effect that in his presence and with Prony Brake in good order, the "Buick" two-cylinder 4½x5-inch Motor developed 22 7-32 H. P. at 924 R. P. M. *is generally discredited.* I believe some of our competitors "who need more power and don't know how to get it" are very largely responsible for it—at the same time, I think we are both interested in setting the public right.

The "Journal," as one of the leading publications devoted to the upbuilding of the Automobile industry, *cannot* afford to let the impression prevail that its special correspondent is sent out to misrepresent, and I am equally certain that the Buick Company *will not* make any claims that cannot be substantiated.

This matter should be taken up promptly and vigorously. What have you to suggest? Wire fully, my expense.

Respectfully yours,

W. C. DURANT,

for Buick Motor Co.

The Reply.

OFFICE

CYCLE AND AUTOMOBILE TRADE JOURNAL.

Philadelphia, Dec. 20th, 1904.

BUICK MOTOR CO.,
52 Broadway, N. Y. City.

Gentlemen: It is not usual for Journals of "standing" and "character" to take notice of rumors or through their editorial columns discuss the relative merits of competing lines. As this is a case involving our "veracity" and "intent," we are most decidedly interested, and not only thank you for bringing the matter to our attention, but will be pleased to co-operate with you in proving our absolute good faith.

We are not surprised that the statement to the effect that your Messrs. Buick and Marr have succeeded in producing a 4½x5-inch two-cylinder engine of 22 B. H. P. created a sensation, as it is certainly very much in excess of power usually developed by engines of this size.

We made the statement as a news item of interest to all makers and users of Automobiles. We considered it worthy of special notice and attention, as we thoroughly believed that Mr. Arnold's figures were correct, knowing him to be a man of great ability and experience in mechanical matters. It will not be difficult to verify Mr. Arnold's statement, and, as he is in Michigan, we have instructed him to visit your factory at Flint again, and prove his figures, so that there can be absolutely no doubt about them.

Respectfully,

CYCLE & AUTOMOBILE TRADE JOURNAL,
JAMES ARTMAN, *Editor.*

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, December 22, 1904. No. 13

ENCOURAGING CLOSED CARS

Electric Vehicle Co. Greatly Enlarges Its Line of Bodies—The Prices That Apply.

It already is quite plain that development in body construction, which carries with it development in the closed type of cars, is to be one of the features of the new year.

The disclosures this week of the 1905 line of the Electric Vehicle Co. shows this trend very clearly. Those luxurious forms of closed bodies that have long marked their electric productions will no longer be limited to that class of vehicle. Instead the big Hartford concern will regularly offer five choices of body with their new four cylinder 40 horsepower Columbia, and will also build special designs to order. The standard body will be, of course, of the side entrance tonneau type, and so fitted the car will list at $4,000, the same price at which their 30-35 horsepower car was catalogued this year. The royal victoria, the straight front landaulet, extension front landaulet and limousine are the other bodies that will be offered.

The new 16 horsepower Columbia, with two cylinder vertical engine, will be priced at $1,750, and the 12-14 double opposed car, which this year sold for $1,750, has been reduced to $1,500.

In electrics the Electric Vehicle Co. will market one new model, the Victoria phaeton, as it is styled, at $1,350; the runabout, which this year listed at $850, has been advanced to $900.

Mitchell Adds to Capital.

Amended articles of incorporation were filed with the Wisconsin Secretary of State last week by W. T. Lewis, president, and V. G. Rogers, secretary, of the Mitchell Motor Car Co., of Racine. Under these the capital of the concern is increased from $300,000 to $500,000. The new capital is to be used for the purpose of increasing the business of the company. Additional factory buildings will be erected early in the spring. The number of men will be increased, and the work of building the new Mitchell models rushed.

Second Dividend for Conrad Creditors.

The final meeting of the creditors of the bankrupt Conrad Motor Carriage Co., Buffalo, N. Y., will be held in that city on the 28th inst. The trustee has a cash balance of $3,625.42 on hand, out of which a second and final dividend will be declared. The disputed claim of the Pennsylvania Electric Vehicle Co. will also come up for settlement, and a date by set for auctioning the remaining effects of the bankrupt, which consist chiefly of accounts receivable, records, etc.

Pegasus Charges Misrepresentation.

Two Chicago automobile concerns are involved in litigation in the Superior Court of that city through the action of the Pegasus Automobile Company. It seeks to regain $6,000 worth of material which it asserts was conveyed to the Royal Automobile Company by misrepresentation.

Duerr Will Change Name.

On December 31 the firm of Duerr, Ward Co., Broadway and Fifty-eighth street, New York, will cease to exist, C. A. Duerr & Co., Inc., taking its place. The change is one of name only, C. A. Duerr having purchased the interest of his partner, Ward, some months ago.

Medal for Rollin White.

Rollin H. White, the designer of the White steamer, was among those honored by the St. Louis Exposition because of the merit of their inventions. He was awarded a gold medal. The car itself, as will be recalled, was given a grand prize.

Prices of The Pope-Toledo.

For 1905 the Pope-Toledo will be marketed in three models, 20 horsepower (front entrance), at $2,800 and 30 and 45 horsepower, both with side entrances, at $3,500 and $6,000, respectively. The 50 horsepower "Pullman" will be built to order only.

"Something Doing" in Elyria.

The presence of Charles M. Schwab, the steel magnate, in Elyria, Ohio, is reported this week. He is in conference with A. L. Garford, the head of the Federal Manufacturing Co.

ENFORCING FIRE REGULATIONS

New York Authorities Inspecting Garages and Strictly Applying Laws Concerning Gasolene.

"Garage owners must hereafter obey the law—the spirit of the law as well as the letter. The regulations regarding the storage and sale of gasolene, which the automobile dealers themselves helped to frame, will be strictly enforced from now on."

This is the dictum of Fire Commissioner Hayes, as delivered by George E. Murray, superintendent of the Bureau of Combustibles, New York Fire Department. Mr. Murray was seen on Tuesday at his office in the Fire Headquarters Building, in West Sixty-seventh street. He had a copy of the Motor World before him when he spoke.

"I hope the Motor World will lay particular stress on the fact that no heating stoves or furnaces will be allowed in garages," he continued. "In future all heat, or steam used for heating, must come from outside the building. If stoves or furnaces were used for heating garages there would always be danger of fire, and their use is absolutely prohibited for that reason. There would always be danger in the daytime, and at night there would be even more likelihood of a fire, as no watchmen are employed at many of the places. Even where there is a watchman, one man could do very little toward saving property if a fire should break out and it got beyond his control.

"It is my opinion that the fire which destroyed the garage of the Standard Automobile Co. was caused by the heating furnace, which stood at the back of the building, as there was no basement there. Gasolene vapor travels in a 'thread,' which varies in size from a hair to about the thickness of a lead pencil. The wagon which was delivering gasolene there just before the fire started had a valve which was much higher than the bottom doors of the heating furnace. I think the driver of the wagon made a faulty connection between the feed pipe of the storage tank and the valve of his wagon, and that it was a gasolene 'thread' from his wagon that caught fire from coals in the bottom of the

Digitized by Google

furnace. It is to prevent anything of that kind from happening that the Fire Commissioner refuses to permit heating stoves or furnaces to be used in garages in the future.

"So far as explosions are concerned, there were none at all on the ground floor of the Standard building except from heated tires," said Mr. Murray in response to a leading question. "There were two explosions on the upper floor, and they were of sufficient force to turn the heavy automobiles completely over. The two machines which were damaged by the explosions had their tanks closed by caps which did not allow the vapor to escape. The caps on the tanks on the ground flood had vents which allowed the vapor to get out, and it was burned just as a strong gas would be, and there were no explosions on that account."

Mr. Murray then threw some further light on the intentions of the Fire Department.

"No license for the storage of gasolene will hereafter be granted where the 'day population' of the building above the garage is one hundred people or more," he said. "In cases where a license has been granted, and it is found that such conditions exist, the license will be revoked. Above the garage of the Michelin Tire Co., whose license was revoked last week, it was found that 250 people were employed on the several floors. Of this number 146 were women and girls. There are only two elevators in the building, and they will carry but four persons and the elevator man at a time. The stairways are very narrow, and if the people employed above the garage were to try to get out in case of a fire many of them would surely be injured. If they could be stood in line and marched out as school children in fire drills it would take at least ten minutes to empty the building. When these facts were brought to the Commissioner's attention he revoked the license at once."

While the Fire Marshal has not made his official report of the investigation he has been conducting into the cause of the fire in the Standard Automobile Co. garage, it seems very likely that the opinion of Superintendent Murray as to the fire's origin is the correct one. In the published reports of the fire the Motor World was the only publication which told of the heating furnace in the rear of the building, and which now seems to be regarded as the cause of the blaze.

The regulations adopted by the Municipal Explosives Commission of the City of New York for the storage of gasolene in "automobile storage stations," and which will now be enforced to the letter, are as follows:

Section 38. In automobile storage stations the storage of naphtha (gasolene) shall be by one of the following methods only:

(a) In an iron or steel tank of design and construction as approved by the Fire Commissioner, said tank to be buried underground with the top at least two feet beneath the surface, and the maximum amount stored therein shall not exceed two hundred and seventy-five gallons; not more than one tank shall be permitted upon the same premises.

(b) In approved sealed metal cans, to a maximum amount not exceeding fifty gallons.

Sec. 39. No sale of naphthas shall be made in automobile storage stations excepting in the transaction of their regular business in the way of filling the tanks of automobiles, and no sale of these products in cans shall be made in such stations in less amount than the entire contents of an original, sealed and unbroken package.

Sec. 40. Immediately upon receipt of naphthas in such stations the same, unless contained in cans, shall be transferred to the storage tank in such manner as to prevent the leakage or dripping of the liquid after the connecting pipe is removed.

Sec. 41. No automobile storage station shall receive a permit for the storage, sale or use of naphthas where the following precautionary regulations are not observed:

(a) Sand shall be kept in buckets fit and available for absorbing waste oil that might fall upon the floor, and such sand when saturated shall be removed to a safe place and burned free from the oils. The use of sawdust for this purpose is strictly prohibited.

(b) No naphtha shall be put into or taken out of an automobile within fifty feet of an open fire, nor until lamps or other apparatus intended to be carried upon the vehicle for illuminating purposes or as pilot lights have been extinguished.

(c) In no case shall naphtha be allowed to run upon the floor or to fall or pass into the drainage system of the premises.

(d) Naphtha shall not be carried in open vessels about the premises; if it is necessary to convey naphtha it must be done in approved closed can or cans with an automatic closing device which shall effectually close same, and of the capacity most closely adapted for filling the machine, but not exceeding five gallons.

(e) If it is necessary to empty the tanks of automobiles, it shall only be done with the utmost precautions against fire, and the fluid must be returned directly to the approved can or cans with the automatic closing device which shall effectually close same.

(f) Buildings of this character shall be lighted only by inclosed electric light.

Sleuth at Paris for Licensed Makers.

Although for some reason his identity is shrouded in secrecy, and nothing was said of his departure, it is stated that the Association of Licensed Automobile Manufacturers had an expert engineer nosing around and taking notes at the Paris show. The idea of the association is to present a first-hand report of the show to all its members. The expert will, of course, reduce his observations to writing and accompany them with sketches of such subjects as he believes will interest the manufacturers concerned. Later the report will be read and discussed by the superintendent of the Superintendents' and Engineers' branch of the association, which, it is said, conceived the idea of having a man on the ground in Paris.

Minneapolis Has a Broadway.

Minneapolis, Minn., business men have organized the Broadway Automobile Co. and elected these officers: F. A. Wing, president; W. G. Norris, vice-president; C. L. Roy, secretary; Edward W. Herald, treasurer. The trustees are C. L. Roy, W. G. Norris, H. B. Hallam, Joseph W. Parker and F. A. Wing. The concern will locate in a new brick building, which is now erecting at the northeast corner of Madison avenue and Broadway. The company will occupy nearly all the ground floor, and will have storage room for about seventy-five cars, besides an ample repair shop.

President Wing has returned from a trip to Cleveland and Detroit, where he arranged to handle the Winton and Cadillac lines.

Negro; Cigar; Then Fire Engines.

The garage of the Mississippi Valley Automobile Company, St. Louis, narrowly escaped destruction on Sunday evening last. Apparently the "not smoking" rule is not vigorously enforced, and it is stated that the damage that resulted was caused by the action of a negro helper in lighting a cigar and throwing the match on the floor beside a two-gallon can of gasolene. In the fire that resulted the negro was the worst sufferer. He was badly injured, but all save two of the automobiles on the ground were removed in safety. These two sustained damage to the extent of $900, while the interior of the garage was also slightly damaged.

Buick in the Biggest Garage.

Frank D. Stranahan, proprietor of the Tremont Garage, is the lucky man in Boston, Mass., to secure the Buick agency. It is not generally known that this is claimed to be the largest garage in the world. It occupies the old Cyclorama Building, at No. 541 Tremont street, which has 40,000 square feet of space on the ground floor and 150 feet in the arena. It will accommodate 1,000 cars. There are fourteen pits in the floor.

Increase in Scranton Trade.

A number of well known Scranton (Pa.) business men have organized the Scranton Garage & Motor Car Co., with a capital of $25,000, and will apply for a charter. One or more lines of cars will be sold, and a garage business conducted. Temporary quarters will be secured, and in the mean time a location will be secured and a building especially designed for garage purposes erected.

Banker's Order for Pierces.

Brief as was the visit of A. L. Banker, of the Banker Bros. Co., Pittsburg, to Buffalo last week, it resulted in the booking of a $100,000 order. The George N. Pierce Co. was the recipient of the order, which was for 25 Great Arrow cars. Five of these were the $5,000 and 10 each of the $4,000 and $3,500 models.

LEGAL LIGHT ON REMINGTON

Litigation Brings Out Woes of Doing Business on Small Capital—An Unique Sales Record.

Although the property of the defunct Remington Automobile and Motor Company of Utica, N. Y., has been sold, the liability of the stockholders for the unpaid portion of their stock still furnishes litigation for the courts. At Utica last week an array of legal talent was present to argue the matter before Judge Ray. Evidence was being taken in the proceedings brought by L. N. Southworth, trustee in bankruptcy, to compel certain of the stockholders to pay a balance of 70 per cent. claimed to be due on their stock.

The testimony brought out related largely to the early history of the concern and of its predecessor, the Ilion Automobile & Vehicle Company, of Ilion, N. Y. S. C. Burch, of Ilion, who was a member of the firm known as the Ilion Automobile and Vehicle Co., which sold out to the Remington Co., testified that he kept the books of the concern for some time. He was the holder of 66 shares in the Remington Co. In the course of his testimony he said that the Ilion company turned its assets over to the Remington company, receiving stock in the latter as payment therefor. When questioned, he said that when the transfer was made, the Ilion company had no outstanding accounts and no debts, and had sold no motors. Attorney De Angelis endeavored to find out what the Ilion company did have, but without much success.

It was stated that the Ilion company received $52,000 in stock for whatever it was that it transferred to the new Remington company.

James S. Holmes, Jr., former general manager of the Remington Co., in the course of his testimony, said:

"The committee of the Utica Chamber of Commerce decided that it would be most advantageous to the company if Mr. Schmidt and I were to come here. I had been receiving $3,000 a year at Ilion, but under the circumstances I agreed to come here for $1,500. Mr. Schmidt did not come. Mr. Van Sickle came in his place. Just before coming here the company in Ilion was principally engaged in trying to get money. We had but one order that I can remember of. We had only such funds as capitalists in Ilion had put up. As to credit, we were able to buy locally oil, coal, etc. We did not attempt to buy stock. We were gradually getting further into debt. At the time the Chamber of Commerce came down to our relief we had negotiated with other parties for funds, but it was our belief that we had either to accept the offer of the Chamber of Commerce or fail. We had attempted unsuccessfully to make arrangements for funds. Stock in the company was sold locally for $25 a share, or 25 cents on the dollar. We had been unable to sell the stock outside."

The testimony was principally to the effect that the agreement entered into between the Chamber of Commerce and the Remington Co., whereby the latter located in Utica, was made in good faith; that, as a matter of fact, it was carried out with such changes or substitutions as were subsequently agreed upon; that the company was satisfied with the manner in which the chamber discharged its obligations, and that the stock was in reality well paid for.

The Week's Incorporations.

Boston, Mass.—Eastern Motor Vehicle Co., under Massachusetts laws, with $50,000 capital. Officers—Charles G. McClutchen, Frank W. Richards, treasurer.

Portland, Me.—Constant Spark Plug Co., under Maine laws, with $50,000 capital, $500 paid in. Officers and corporators—H. L. Cram, president, and Charles H. Weston, treasurer.

Middletown, Conn.—Hubbard Motor Co., under Connecticut laws, with $100,000 capital; to begin business with $50,200. Corporators—H. W. Hubbard, John T. Eugenian and Robert H. Downes.

Chicago, Ill.—Commercial Automobile Co., under Illinois laws, with $5,000 capital; to manufacture motor vehicles. Corporators—Paul Carpenter, Albert G. Miller and Albert C. Howard.

Garwood, N. J.—Motor Construction Company, under New Jersey laws, with $50,000 capital. Corporators—Henri G. Chatain, Gustavus T. Kirby, P. C. Midgley and William B. Elliot.

St. Louis, Mo.—Park Automobile Co., under Missouri laws, with $10,000 capital, one-half paid in; to do a general automobile business. Corporators—A. T. Primm, jr., and Charles E. L. Thomas.

Columbus, Ohio—The Curtin-Williams Automobile Co., under Ohio laws, with $5,000 capital; to do an automobile manufacturing business. Corporators—T. E. Curtin, Roy O. Williams, Frederick Wardlow, Alfred A. Williams and Charles Wardlow.

St. Louis, Mo.—South Side Autotmobile Co., under Missouri laws, with $5,000 capital, full paid; to manufacture and deal in automobiles. Shareholders—William R. Orthwein, Newman Samuel, Louis A. Hoerr and John Hoerr, jr.

Jackson, Fla.—The East Coast Automobile Co., under Florida laws, with $10,000 capital; to conduct a general wholesale and retail business in automobiles, motor boats and marine engines. Corporators—P. L. Sutherland, Guy R. Champlain, E. A. Groover, A. D. Covington and A. S. Hubbard.

Geisel Prepares for Enlargement.

The Geisel Automobile Co., Springfield, Mass., have been incorporated, under the laws of Massachusetts, with $35,000 capital. They have taken the agency for the Winton and Cadillac, and in the spring intend to build what will be one of the largest automobile stations in New England.

FACTORY VISITS FASHIONABLE

Practice of Showing Customers Processes of Manufacture a Growing One—Its Effect on Sales.

"Buyers of cars are getting the 'factory fever' in a pronounced form," said a local tradesman to a Motor World representative one day this week. "If it goes much further it will soon be impossible to sell a car except 'subject to inspection and approval of the factory.

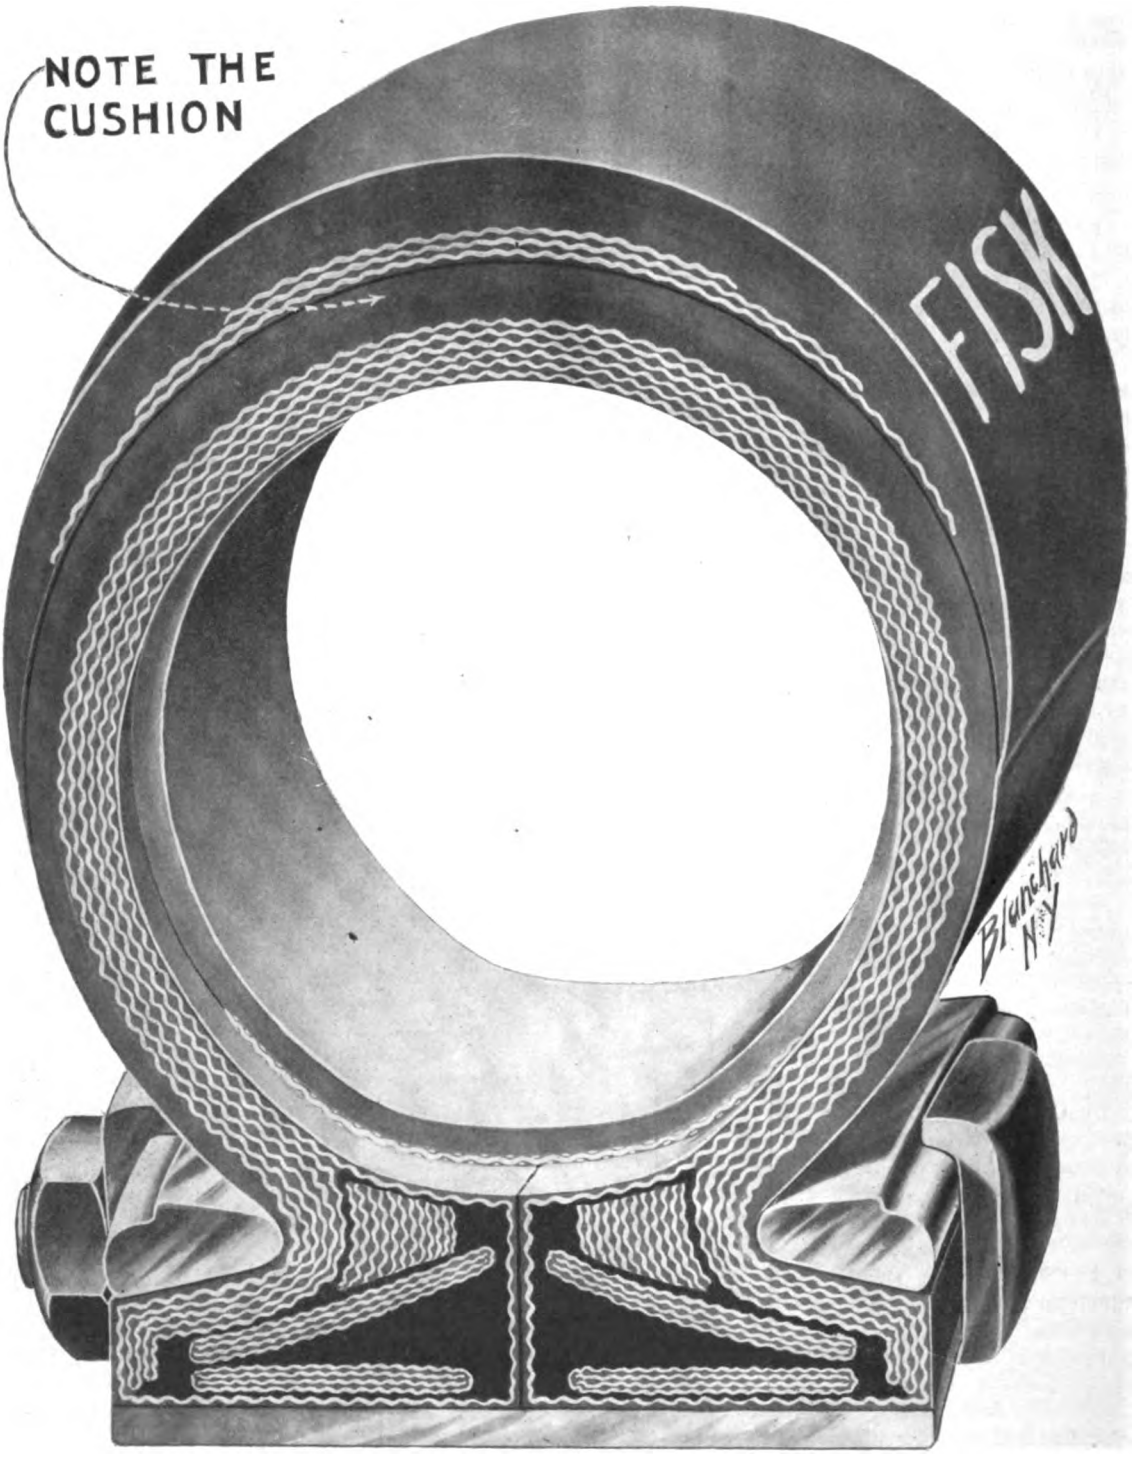
"It works something like this," he continued, in a half disgusted tone: "A man came in the store this morning and asked to be shown a car. He proved to be really interested in the car, listened intelligently to all I had to say, and I began to think that I was going to book his order then and there. But just as I was patting myself on the back and getting ready to take down his specifications he took the wind out of my sails by saying:

"'I like your car very well, indeed, and before I decide I shall give it serious consideration. But I have an engagement to go to the Blank factory to-morrow—travelling by car, if the weather is good, or by train if it storms—and make a tour of inspection there. They are very anxious to have me go through it, and I have several friends who have done so. Now, I suppose you would have no objection to my doing the same with your factory? I should not care to place my order unless I had first seen something of the methods and processes in vogue there. You see, I should feel so much more comfortable and satisfied after making an examination of this kind.'

"Of course, there was but one thing to do, and that was to say yes. I told him that we should be glad to show him through our factory, as we were not afraid to have it known what was being done there. He said that he would see me again, and make an engagement, and with that understanding we parted.

"How do I like it? Oh, I don't mind so very much. Of course, it delays a sale and adds something to the difficulty of making it; besides, our factory is nothing like as large as the one he is going to inspect before ours, and that may hurt us. But if he has intelligence enough to disassociate quantity from quality, and to note the care with which we build, the quality of the material we use and the admirable system of manufacture, his decision can scarcely be anything but favorable to us."

Four More Get Show Space.



The space on the stage in the concert hall of Madison Square Garden, which was not allotted by the Motor & Accessory Manufacturers when they apportioned their share of show space, has been given to the Hess-Bright Co., Philadelphia, the Wheeler Manufacturing Co., Detroit, and the Autocar Equipment Co., Chicago. The space vacated by C. A. Metzger has been awarded to the Consolidated Manufacturing Co., Toledo.

Carburetters to the Fore.

As usual, the first bona fide and informing report of the Paris show comes from the well versed correspondent of the Motor World. His report, published in another column, shows his excellent grasp of the situation, and in the fewest words points out quite plainly the trend of foreign trade.

It is evident that the day of sensational developments has passed, and that the improvement of automobiles is proceeding on certain well defined lines, all making for increased efficiency; indeed, increased efficiency may be reckoned the keynote of the Paris show, and this, as always, is obtained by attention to and improvement of details.

It is not strange that attention to the carburetting systems has been one of the chief factors in achieving results. The carburetter may be said to be the only, or at any rate the principal, vital part of the automobile that has not received its full meed of notice and improving care. That it finally has come or is coming "into its own" is a sign of much promise.

If sensations are in store, of which, however, there is no indication, we believe they will develop in the form of carburetters. There is small doubt but that the fluctuations in the horsepower of engines of similar dimensions are due almost wholly to differences in carburetting. The idea has too long prevailed that increase of efficiency and power, which are largely the same thing, is to be had only by the employment of larger motors, which carry with them increase of bulk and weight and strains in many parts. Ultimately we are sanguine that it will be shown that the same results, or better, and without increase of bulk or weight, are possible by improved means of carburetting. From this distance, the prominence of carburetters at the Paris show stands out clearcut and well defined, and holds hope of efficiency of the sort that is appreciated not less by makers than by users.

Visits to the Factories.

How quickly a new fashion "catches on" is shown by the growing popularity of the practice of making factory inspections. The practice itself is not new; prospective purchasers have journeyed to factories and examined the processes in vogue there to their own satisfaction and with the entire approval of the makers. But the custom was little observed and then only incidentally. The representative of a maker might comment favorably on a desire expressed to inspect a factory, or even extend an offhand invitation to do so. But such comments or invitations were purely casual and rarely resulted in a visit being actually made.

The present movement is a totally different one. It was conceived originally as a shrewd scheme to clinch sales that were or seemed to be doubtful, or which for any cause could not be closed. In its ideal form, the plan is to drive the customer to the factory and conduct him through the latter for the purpose of enlightening him on the subject of motor car construction and making it perfectly clear that a well organized and finely equipped plant is absolutely necessary for the construction of an up-to-date car. "Let me drive you up to the factory some day soon and show you our improved processes of manufacture," the invitation would frequently be couched. "By so doing you can obtain a splendid demonstration of our car and then see how we make it." To some customers a proposition of this sort appeals with great force, and it is not astonishing that many such runs have been made, especially before the approach of winter, with its cold and snows, robbed them of the greater part of their attractiveness. But it did not stop even there. When the drive by motor car became unpleasant, there still remained the railroad train as a swift vehicle, capable of bridging the distance between town and factory. It presented the additional advantage of increasing the radius of action and bringing factories hundreds of miles away within the scope of operations. The drive in the car under consideration was cut out entirely, of course; but there remained the run through the factory, which to the intelligent non-mechanical visitor was certain to be an eye-opening process, and to the man of mechanical knowledge was a joyous journey.

Here and there will be found tradesmen who do not believe in encouraging this movement. It may be owing to their not feeling satisfied that their factories will make a favorable impression on visitors, whether because of the small size, imperfect facilities or backward stage of the product, or because they do not wish to be bothered with visitors or they fear that sales will be delayed. All of these reasons have their influence, but the more clear sighted tradesmen welcome the visits and even make special efforts to attract them.

When spring comes and the selling season opens in earnest, the practice is not likely to be followed to any great extent. Buyers will be too impatient to visit factories, to say nothing of having looked over the field and made up their minds.

Lack of Holiday Trade.

Perhaps the dullest week since last winter in local trade circles has been the present one. The heavy downfall of snow has put the finishing touches to a period when buyers are disposed to hold off, in view of the nearby shows, and the result has been almost total stagnation in practically every store in the city. In all probability the same condition has prevailed in most cities and towns throughout the country. Seemingly no effort was made to secure business; dealers reasoned that no one was disposed to buy, and that it would be a waste of time to take any steps to effect sales.

The unanimity with which a cold shoulder has been turned to the Christmas time, and

Digitized by Google

the holiday buying throng ignored is nothing short of remarkable. It is almost as if these did not exist. Asked if there had been any Christmas buying, most dealers smiled pityingly and said no; some of them added that people were not likely to buy automobiles for Christmas presents, as they were too costly. Nor had any effort been made to call automobile accessories—lamps, horns, baskets, etc.—to the attention of people who might be looking for suitable articles for Christmas presents.

There is scarcely any need to say that this is all wrong. The merchant instinct that should actuate automobile dealers and impel them to seek means of extending sales is strangely dormant, or this indifference would not hold sway. No other class of retailer permits Christmas to pass without seeking to obtain his fair share of trade. Those who deal in the cheaper classes of merchandise are the most active, of course. To them come the bulk of buyers, and they can count with reason on an enormous output. But bigger and more costly goods are by no means neglected. The makers of sewing machines, of pianos, of horses and carriages, of boats and launches. of guns and a dozen other useful but relatively high priced articles resolutely set themselves the task of capturing their quota of the holiday trade; and the retailers of such goods bid for the trade just as eagerly, adroitly and systematically as do their fellow retailers whose wares happen to suit humbler purses. And, as we all know, they obtain a very fair measure of success.

Theer is not the slightest doubt that automobile dealers could meet with similar success by deserving it. If they bid for trade of this character, conducted a regular and intelligent advertising campaign, attracted people to their stores, having first dressed the latter attractively and fittingly, there cannot be the slightest doubt that a respectable number of sales of cars would be made; while accessory sales would far exceed them in volume.

About Deliveries.

A mixture of the bitter and sweet is contained in a recent decision of a Paris court. That the automobile industry has reached a stage where the processes of production can be predicated with a reasonable degree of accuracy and certainty, and that, therefore, promises can and should be fulfilled, is the court's contention, as put forth in these words:

"In consequence of the progress made for some years in construction of automobiles, builders sometimes for the purpose of not losing an order make engagements which they are unable to fill in the stipulated time. In such cases they must be liable to damages."

The dictum was called forth by a suit brought to recover for the non-delivery of an automobile as agreed. The court found for the plaintiff and awarded him damages in the sum of $300.

While directly affecting only the French industry, the decision is of interest in this country. There are always two sides to a contract, and the one that has been most prominent heretofore is that which bound the purchaser and left the seller to all intents and purposes free. The former usually paid a percentage of the list price when he placed his order; in past years he frequently had to pay a premium or bonus as well. If he received delivery anywhere near the specified time he was content, while long delays were accepted philosophically as being a part of the game.

There can be no manner of doubt that this stage is passing—has almost passed, in fact. Prompt deliveries form the keystone of the arch of success, and no maker can hereafter afford to be dilatory in filling his contracts. Even more effective than a court decision in spurring him on will be the force of competition, the absolute necessity of taking advantage of the prevailing trade winds and obtaining every possible advantage. The penalty will be the loss of business, and that no maker can afford to risk.

Side Entrances and Baskets.

With the appearance of the side entrance car has arisen the necessity for a change in the design of the wicker baskets which are an almost indispensable adjunct of all touring cars. These were fastened to the side of the tonneau body, there being ample room between the front and tonneau seats for a basket long enough to hold almost anything the passengers desired to put there. Taking advantage of the almost uniform design of touring car bodies, basket makers produced a few standard patterns, each of which fitted a number of well known cars.

With the sudden displacement of the tonneau by the side entrance type, at least as the leading 1905 model, has arisen the necessity for either abandoning the basket and providing other means for carrying impedimenta, or of changing the designs of baskets and adapting them to be attached to the rear of the body which, of course, has no door to interfere with its disposal. A third course is to attach a small basket to the side of the body, having it short enough to extend only to the side door. Where the car has a generous wheel base this plan will be frequently followed, for we have become accustomed to the appearance of side baskets and, almost unconsciously, resent any change from them to rear ones.

At the same time, it is already apparent that the rear basket will be extensively used. Basket makers have been quick to notice the change in body construction, and some of them have already brought out baskets designed to be attached to the rear of the car. They will look a trifle odd at first, and, of course, only one basket can be fitted, in place of the two side baskets now used. But it will only be a short time before the newness of the rear basket will wear off, and there is no reason why the size of them should not be increased so they will hold as much as two side baskets.

COMING EVENTS.

Jan. 11-15—New York, Importers' Show, Herald Square Exhibition Hall.

Jan. 13—New York, Motor and Accessory Manufacturers, annual meeting, Hotel Astor.

Jan. 14-21—New York, National Show, Madison Square Garden.

Jan. 16—New York, American Automobile Association, annual meeting and election.

Jan. 19—New York, Superintendents' and Engineers' Branch of the Association of Licensed Automobile Manufacturers, meeting.

Jan. 20—New York, National Association of Automobile Manufacturers, smoker.

Jan. 21—New York, National Association of Automobile Manufacturers, annual meeting.

Jan. 21—New York, Automobile Club of America, annual banquet, Astor Gallery, Waldorf-Astoria.

Jan. 23-28—Ormond-Daytona, Fla., third annual speed carnival.

Jan. 23-28—Philadelphia, Automobile Show.

Feb. 4-11—Chicago, National Show, Coliseum.

Feb. 13-18—Detroit, Automobile Show.

Feb. 20-25—Cleveland, Automobile Show, Gray's Armory.

Feb. 27-March 4—Toronto, Automobile Show.

March 6-11—Buffalo, Automobile Show, Convention Hall.

March 13-18—Boston, Automobile Show, Mechanics' Hall.

March 13-18—Boston, Importers' Show, Symphony Hall.

March 27-April 5—Washington, Automobile Show.

POINTS FROM PARIS

While Show Contributes Nothing Radically New Much Refinement of Detail is Apparent—Carburetter Improvement Conspicuous.

Paris, Dec. 9.—The seventh annual Paris show, or, to give it the official title, l'Exposition Internationale de l'Automobile du Cycle et des Sports, was officially opened this morning by President Loubet, accompanied by his staff and a long train of officers, Deputies, Senators, officials and journalists, who paraded the gangways and obtained a general impression of the show's appearance. At the moment the chief magistrate entered the Grand Palais the notes of "The Marseillaise" gave the signal for the cessation of the din of hammering, which, until that moment, had been ringing round the galleries. So far as the main hall was concerned, the stands were nearly complete, and only needed a few touches to put everythig in perfect order, but around the galleries there is still much to be done before the stands can be regarded as completely finished.

OPENED BY THE PRESIDENT.

As President Loubet made his official promenade, chatting with the officials and occasionally stopping to compliment an exhibitor, he certainly must have been strongly impressed, as every non-technical visitor will be, with the wonderfully artistic setting in which it is possible to display the severe mechanical lines of an automobile. Every year it is the aim of the organizing committee, and of exhibitors themselves, to give a note of originality to the exhibition. However good a thing may have been in the past it has to give way to something newer and more striking, as well as more artistic, and it must be confessed that all concerned have succeeded in making the exhibition far more attractive and wonderful than in previous years. The one central idea in organizing the show is to make it the rendezvous of Paris. Outside the Grand Palais the long lines of Corinthian columns and architraves are picked out in festoons of electric lights, and along each side of the wide avenue are great pillars supporting multitudes of lamps, while in the centre is a lighthouse that at nighttime will send a beam of light to all quarters of the city. Inside the magnificent building a vast half globe is suspended from the glass roof, covered with electric lights, and from this are hung long interminable lines of incandescent lamps. On the stands we find an almost endless variety of novel designs, from a wrought iron lighthouse to festoons of artificial flowers, each concealing an electric lamp. When the current is switched on, the whole of the palace, inside and out, is in a blaze of light, forming one of the most brilliant and artistic effects that we have seen at any show of this kind. Altogether, about two hundred thousand lamps are employed in the decoration.

Notwithstanding the mass of design, the decorations are arranged in such a way that they in no manner interfere with the perspective of the long lines of stands from one end of the huge building to the other.

The trouble that was threatened last year through the organizers being unable to find sufficient accommodation for all the exhibitors has compelled them to provide extra space, and the heavier parts of the exhibits, such as machine tools, stationary engines, motor boats, motor balloons and the like, have been relegated to the Horticultural Palace, on the banks of the Seine, within two minutes' walk of the Grand Palais. In this way nearly all the firms have been able to secure space, although none of them have obtained what they wanted, and a maker deems himself very fortunate if he can exhibit a chassis and three or four cars.

FOREIGN EXHIBITS FEW.

While great stress is laid upon the fact that the annual Paris show is international, it must be admitted that the foreign element is not so strong as might have been expected, in view of the continued progress of the automobile industry in other countries. So far as Great Britain is concerned, this may be partly attributed to an alleged sense of patriotism which induces the makers of England to patronize their own shows and save themselves the trouble and expense of sending over vehicles to be shown in competition with the French. The only British firms exhibiting are the Hozier Engineering Co., of Glasgow, who had the distinction this year of paying a dividend of 50 per cent; the Wolsley Tool & Motor Car Co., Ltd., and C. S. Rolls & Co. Nor is the United States represented in the way it should be, for the only American cars exhibited are the Oldsmobile and Pope, the latter having been just introduced into France with an idea of making a good bid for business on this side. The success of the Oldsmobiles proves, indeed, that there is something to be done in American cars if only the price is right. Other countries represented are Belgium, Germany, Italy and Switzerland.

It is always the custom to give the show a good send-off by distributing something like one hundred thousand invitations for the first day, so that the opening is nothing but a deadhead show, when the whole of the vast building is crammed with a compact surging crowd that makes it quite impossible to get more than a cursory view of the stands. An inspection of the cars at most of the leading works before they were sent to the show has enabled the Motor World representative, however, to get a fair idea of the technical changes that have taken place in the new vehicles.

PANHARD EMPLOYS HYDRAULIC REGULATOR.

Panhard & Levassor have made no change in their ordinary cars, but they are exhibiting a new 50 horsepower vehicle possessing many new features which have been tested during the last year on the racing machines. This firm is one of the very few who still employ the flitch plate and wood frame in preference to the pressed steel frame, which they use only on the racing cars. They claim that the combination of metal and wood is much more satisfactory for touring cars, in the sense that it gives a greater rigidity. Most of the makers have found it necessary to brace the pressed steel frame so as to avoid torsion through shocks when great strains are thrown on the transmitting mechanism. The Panhard engines continue to be built with cylinders cast separately, and in the 50 horsepower car the engine is governed by a hydraulic regulator, in much the same way as the British Napier. The clutch is of the type that has been employed on the racing machines—that is to say, it is composed of a number of flat metal plates placed alternately on a box on the crank shaft and on the driven shaft, so that when pressure is applied against the plates the friction of the plates against each other is sufficient to give a perfect clutching motion, at the same time that this motion is rendered gradual by the slipping of the plates until the maximum pressure is applied to them.

Another departure from the usual Panhard practice in this new 50 horsepower car is the honeycomb radiator. It is probable that this new car is intended to prepare the way in the coming season for a general change in Panhard design, although it is certain that the features referred to will not be adapted to the standard cars unless it be found that the 50 horsepower vehicle gives satisfaction in practical work.

TREND OF THE TRADE.

The way in which Panhard & Levassor are hesitating about adopting new devices is pretty characteristic of the French trade generally. Here and there we find firms making changes in detail, which, however, in nearly all cases tend to the settling down to general types. In the engines, for instance, the cylinders are generally cast separately for the sake of economy and ease of boring, and the mechanically operated induction valve is now nearly always employed, although there are still several firms who operate the valves by two half time shafts instead of having all the valves on one side so that they may be actuated by one cam shaft. The high tension magneto is making rapid headway, although it is customary to fit the accumulator and coil as a stand-by in case of accident to the magneto, which, on account of its somewhat delicate construction, is calculated to give users the impression that it is liable to get out of order. It may be taken for granted that the magneto will be so far improved as regards solidity that motor car owners will have no further fear of trouble on this score, in which event the accumulator and coil will be entirely dispensed with. At the same time the coil and trembler allow of rather more elasticity to the engine by giving a higher efficiency with an advance of ignition, but this little advantage is more than counterbalanced

Digitized by Google

by the convenience of employing a generator of electricity.

The only way in which makers have been able to improve their engines is by paying particular attention to the carburetter. Nearly every big firm has brought out an improved carburetting device of some form or other with the object of getting a constant mixture at all speeds. Among these devices may be mentioned the new Decauville carburetter, in which the gasolene is sprayed up with the air around an elongated cone. The cone principle is, in fact, being adopted by many makers, who find that this is the most satisfactory way of getting a high velocity of air over the gasolene jet. Charron, Girardot & Voigt have also introduced a new carburetter, based upon the principle of the Leon Bollée carburetter, which was shown for the first time last year, in which there are two gasolene jets, a large and a small one, so that the former can be closed when the engine is running at low speeds.

In clutches the leather faced type is still generally adopted in a much improved form, and by an arrangement of springs under the leather facing a much more gradual action is given to the clutch, at the same time that it is less liable to slip. Change speed gears have undergone no change, except in very small detail, and even De Dion, Bouton & Cie. have dropped their internally expanding clutch and have returned to the classic sliding gear.

The most remarkable thing about the new cars is that while makers have been able to break away from standard patterns, they have yet succeeded in considerably increasing the efficiency of the engines and of the transmitting gear, in the former case by means of more suitable carburetters and in the latter by employing ball bearings in every part of the vehicle except on the crank shaft, although some firms have even gone to the extent of employing ball bearings on this part of the mechanism.

This rapid survey of the improvements carried out in the new vehicles will show that there is, after all, very little change in general design, and that the only thing done during the last year has been to increase the efficiency of the vehicles by little improvements in detail. The whole interest of the show is, in fact, centred in detail, and there is enough to be seen to keep the automobilist fully employed during the whole time of the exhibition. As there is always a stand at each show specially selected by public opinion as the "best," so on this occasion every one admits that the best stand, so far as appearance of the cars is concerned, is that of the great engineering firm of Delaunay-Belleville, who are for the first time showing cars of remarkably high engineering finish.

The great crowds that have filled the building to-day have rendered impossible the photographing of cars or features of special interest, and to catch the American mail only this general summarization is possible; detailed descriptions must be dealt with later.

R. F. C.

Pitcher Has Pretentious Plans.

The Memphis Automobile Co., of Memphis, Tenn., which has been formed to put on the market cars equipped with the Pilcher compound steam engine, has purchased twenty acres of land near Memphis, has let contracts for a factory and hotel building, and has the finished working model of the new engine ready to turn on steam.

The tract of land bought by the Automobile company is located five miles from Memphis, on the Mullens estate. This land lies along the N. C. & St. L. Railroad, and on it the new company plans to build its factory, homes for the workmen, a small hotel, homes for the officers of the company, and, in fact, to establish a small town.

The main factory building, which will be erected later, will be 50x150 feet, and will have, in addition, two large wings.

The first working model of the new Pilcher engine is finished at the Duke Machine Works, and steam will be put in it in a few days.

Expansion in St. Louis.

St. Louis is rejoicing in the prospect of an addition to its industries in the shape of an automobile plant which will be "the largest in the world." The St. Louis Car Co. is to bring this dream to realization, and to that end it has increased its capital to $500,000. This stock, however, will not be offered in the open market. The Whitaker-Weber tin plant, at No. 5,300 North Second street, has been purchased, and will be remodelled at once. The plans provide for a floor space of 100,000 feet, and 1,500 men will be employed, it is stated. Work will be started in thirty days.

Models of French gasolene cars of 18, 24 and 50 horsepower are to be manufactured, and a smaller and more popular priced machine besides the $3,000 to $8,000 machines of the larger type will also be placed on the market.

How Snow Caused Damage.

A peculiar accident occurred at the Newport, R. I., establishment of the Pope Mfg. Co. last week. The heavy weight of snow which fell in the storm the night before crushed the roof down upon the tops of many automobiles, including one belonging to Oliver H. P. Belmont.

Parts of the roof had to be sawed away to release some of the automobiles. Representatives of the company moved automobiles to stable and barns, and with a force of mechanics set to work to repair the damaged machines.

New Concern Completes Organization.

Stockholders of the newly formed Curtin-Williams Automobile Co., of Columbus, Ohio, have completed their organization by the election of thes officers: President, Thomas E. Curtin; vice-president and superintendent, Roy Williams; secretary-treasurer, Fred Wardlow. The officers named and Charles Wardlow and Dr. Yateman Wardlow will constitute the board of directors. The company decided to open its garage at No. 121 Parsons avenue this week, and the building is now practically completed for its new tenants.

Buffalo Trade Selects Leaders.

C. W. Rose was elected secretary of the Buffalo (N. Y.) Automobile Trade Association last week, succeeding D. H. Lewis, who declined to serve after being re-elected. Lewis was made manager of the approaching showy to be held next March, however. Other officers were elected, as follows: E. R. Thomas, president; J. A. Cramer, vice-president; John J. Gibson, treasurer. The executive committee is composed as follows: E. C. Bull, Jesse B. Eccleston and P. W. Elgner.

White Honors Retiring Manager.

To-day the White Sewing Machine Co., of Cleveland, Ohio, is tendering an informal luncheon at the Hotel Astor, New York, to Paul H. Deming, manager of the New York branch, who retires from that position on January 1. The guests include Dave Hennen Morris, president of the A. C. A.; W. E. Scarritt, H. W. Whipple, James B. Dill, A. T. Post, A. R. Pardington, S. M. Butler, Emerson Brooks and Windsor T. White, representing the company.

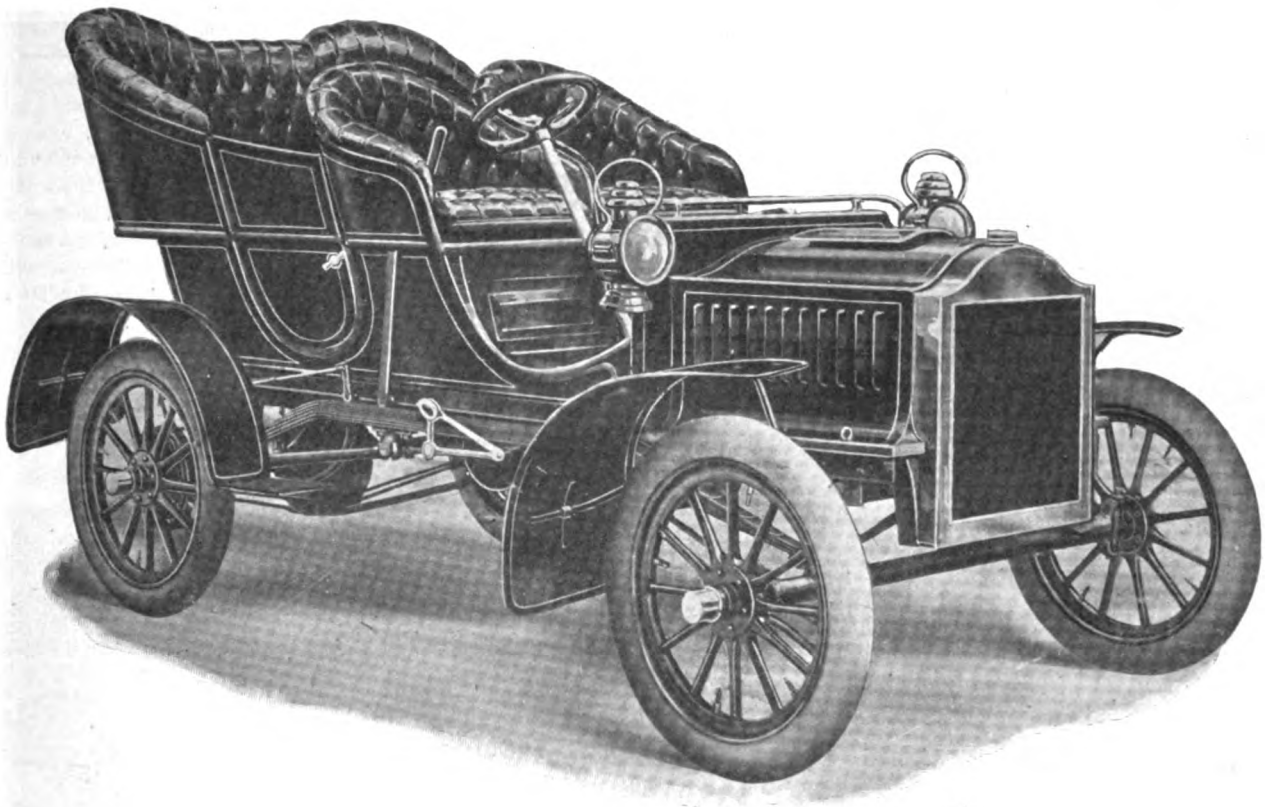
'Frisco Hill Climbers Secure a Site.

The Hill-Climbing Auto Manufacturing Co., of San Francisco, have purchased a site on the Nystrom addition for a factory to manufacture automobiles. The officers of the company are: President, P. J. Leharbach; vice-president, A. B. Cameron; secretary, M. Mackowitz; treasurer, G. W. Pollis; attorneys, Frisbie & White.

Greenwood Gets One, Too.

Greenwood, Ind., plumes itself on having secured an automobile factory as an addition to its industries. A committee of citizens signed a contract last week with the Standard Engine & Automobile Co., under the terms of which that concern will locate in Greenwood and keep its factory running for five years. The factory will be 50x250 feet.

The Temptation of Aurora.



E. G. Struckman, of Bartlett, Ill., and Charles Cotta, of Rockford, Ill., are coquetting with Aurora, Ill., with a view of locating an automobile factory in the latter place. They state that they mean business, but decline to give out any details of the negotiations.

Tray Plate Battery Changes Owners.

The Tray Plate Battery Co., Binghamton, N. Y., have purchased the patents, equipment, etc., of the Smith Storage Battery Co., and will continue the manufacture of the patented Tray Plate storage batteries. They will likewise produce a cell type battery for motor vehicle use.

The Most Recent Creation in Oldsmobiles.

About the Newest Oldsmobile.

Details of the much talked of and long expected double cylinder Olds car have at last been made public. The accompanying illustration gives a good idea of its appearance, and the following description will make its general construction clear.

The car is styled the Oldsmobile touring car. It has the popular side entrance type or body, with a 90-inch wheel base and a 55-inch tread. The weight is 2,350 pounds. Upon an angle steel frame is mounted a double opposed cylinder engine, with 5¼x6-inch cylinders, developing 20 horsepower at a normal speed of 750 r. p. m. At this speed the car will attain a speed of twenty-three or twenty-five miles an hour; the range of speed on the high gear is six to forty miles an hour. Memchanically operated valves are used, fitted above the cylinders and out of the dust. A 2-inch crank shaft is used, with a drop forged steel connecting rod; four piston rings are fitted. The front axle has ball and the rear roller bearings. The wheels are 30-inch, with 3½-inch front and 4-inch rear.

The transmission is of the planetary type, with two speeds forward and reverse, steel and bronze gears, encased in oil, being used. A radius rod is employed to adjust the chain. The well known Olds side springs support the body. Brakes on the transmission and hubs are fitted, all being operated by foot levers. The cooling system consists of a honeycomb radiator on front of frame. The radiator surface is of large size, and has proven extremely efficient. Circulation is by gear pump. A sight feed lubricator, with tubes running to various bearings, is fitted. Gasolene tank capacity, 15 gallons; water tank capacity, 8 gallons, both tanks being located under a hood.

Disappearing Salesman Run to Earth.

The Standard Automobile Co., of Pittsburg has got on the tracks of N. J. Farrend, who is accused of having stolen an automobile from them. Farrend appears to have made a business of purloining automobiles, for he was arrested in Lima, Ohio, charged with a similar crime. Singularly enough, Farrend's wife was arrested at Topeka, Kan., on the same day that the Lima authorities apprehended Farrend. Mrs. Farrend, who is said to be the daughter of a prominent man in Geneva, Ohio, denied all knowledge of the crime with which she is charged.

The Standard company charges that about a year ago Farrend was sent with two automobiles to Lima to sell. He made the sales, which amounted to about $2,000, and is said to have kept the money. He disappeared, and the case was turned over to a local detective agency which failed to get any trace of the man.

Requisition papers will be sent to Ohio for Farrend, and if the police of that city do not prosecute him he will be brought to Pittsburg for trial.

"That 'one lunger' over there," was the language the workman used as he pointed to a small car in the corner of the garage. It required inquiry to discover that "one lunger" meant a single cylinder car. In some parts of the East the term is coming into use to describe all such cars.

Carousing Chauffeur Haled to Court.

Will Halliburtan, a discharged employe of the Anderson Automobile Company, Nashville, Tenn., gave the police of that city a lively time last week and incidentally landed himself in jail, charged with housebreaking, larceny and with being drunk and destroying property. In the housebreaking cases W. T. Anderson is the prosecutor, while Goodloe Lindsley is prosecuting the larceny cases.

Lindsley has been accustomed to keep his car at the Anderson Automobile Company. Halliburtan was formerly an employe of the company, but had a key to the shops and, with a companion, entered and secured the machine. The men, it is said, had been drinking and lost control of the machine on Union street. It turned and crashed into the glass front of Marshall & Bruce. The glass was shattered and the machine was badly damaged. The machine was valued at $2,500 and sustained damages of about $200. The wheels and a fine headlight were broken. Neither of the men was injured.

Will Not Consider Defects Unavoidable.

Owners as well as drivers of automobiles are to be held to a strict accountability for accidents under a bill introduced in the German Reichstag. Under its provisions both are made responsible for injury to persons or property by their cars. Responsibility can only be avoided by proving that the accident was due to unavoidable circumstances or to the fault of the person injured. However, it will not be regarded as an unavoidable contingency if the accident is attributable to inferior machinery or to a defect therein.

Breakages of Axles.

Carriage axles in case of accident bend, but very seldom break; they break only under a very severe shock. Continued shocks, successive vibratory action, overstraining and improper construction may affect the quality of the material, but usually the material used is of the very best and is calculated to resist shocks and vibrations, overstrains and overloading. Improper construction will wear them out sooner, but if the material is of the best they will not break if the size of the axles is in conformity with the weight they are calculated to carry.

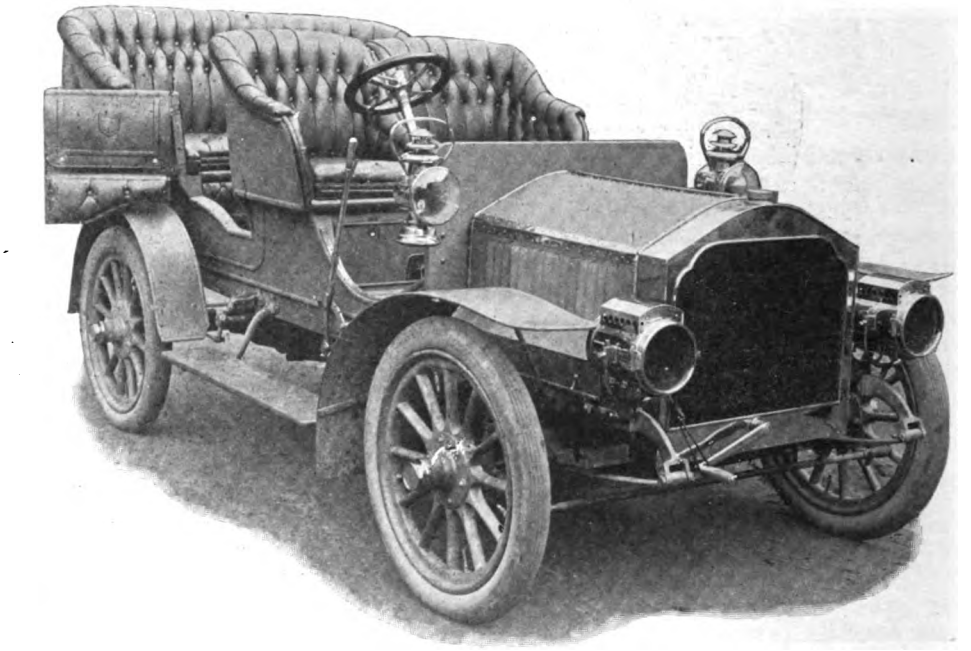
Wagon axles break, and break very often. The causes are that the material on common wagon axles is not of the best. The vibration is such that from the constant use of wagons the vibration affects the inferior iron and the axles generally break on the round part in front of the collar, which is generally due to crystallization.

If the iron or steel is properly prepared for welding and properly welded, there is no reason why a fracture should occur at the point of welding sooner than at any other point. Fractures very seldom occur at the weld where a thorough union has been effected. If they do occur, they are usually near the weld, and which is solely due to a wasting of the metal at that point while generating the necessary heat for welding. Fractures occur in such places where there is most strain, and at the weakest point, if there is a weld or not.

The theory is that iron breaks more readily at a weld than at any other place, but smiths of forty years' experience in the carriage and wagon shops deny it. Experienced smiths all agree that if the weld is perfect it will not break at the weld, excepting when overstrained, and if the material is of the very best it will bend and not break.

About Irreversible Steering.

By many people the term "irreversible steering," a feature claimed for almost all cars, is only vaguely understood. It is nothing more or less than a worm and segment operated lever in place of the direct steering formerly used on steam runabouts and most other lever steered cars.



Irreversible steering is applied to the form of steering which is so geared that if the front wheels strike a brick on the road they are not deflected and do not transmit the shock to the steering wheel. To test for one's self whether the steering be really irreversible is a simple matter. The front wheels should be jacked up off the ground, and if the wheels can be moved in any direction by grasping hold of them and pushing them, then the steering cannot be claimed to be irreversible.

To have the irreversible quality, it is necessary to have the lever, which is operated by the worm segment, very short, and this necessitates a complete revolution of the steering wheel before the front road wheels are half locked or turned.

In practice, it is found desirable to sacrifice some of the "irreversibility" of the steering to the handiness of having a steering wheel to which the front wheels quickly respond.

Reconstruction of the Pope-Hartford.

The Pope-Hartford of 1905 is one of the cars that leave no resemblance to the vehicle that bore that title during the current year. As the accompanying illustration bears witness, it has been entirely remodelled, and passes from the single cylinder to the double opposed class. The construction of the engine is such that the various internal bearings are easily accessible for adjustment. All gears run inside the case, and are properly lubricated by splash. The wrist pin bearing of the pistons is of the trunnion type, made hollow and ground to fit. The bolt that locks the connecting rod to the wrist pin fits in a groove which makes it impossible for the pin to ever score the cylinder sides. This construction provides what the Pope Mfg. Co. say mechanical engineers agree is the very best form of bearing.

THE REMODELED POPE-HARTFORD.

The car, which has a side entrance tonneau, is fitted with double brakes, wheel steer and jump spark ignition. The control is by spark and throttle levers, placed conveniently on top of the steering wheel post. There are three speeds forward and one reverse. Between the engine and the transmission gear case there is a compensating joint, which will take care of any twists which might tend to throw these two parts out of alignment. The power is transmitted through this to the gears in the transmission case, and then to the rear axle through a propeller shaft.

First Test in the Snow.

The Berkshire Automobile Co., of Pittsfield, Mass., turned out its first touring car last week, and at once gave it a severe test. It was driven through six inches of snow to West Pittsfield and return, and showed up in excellent fashion.

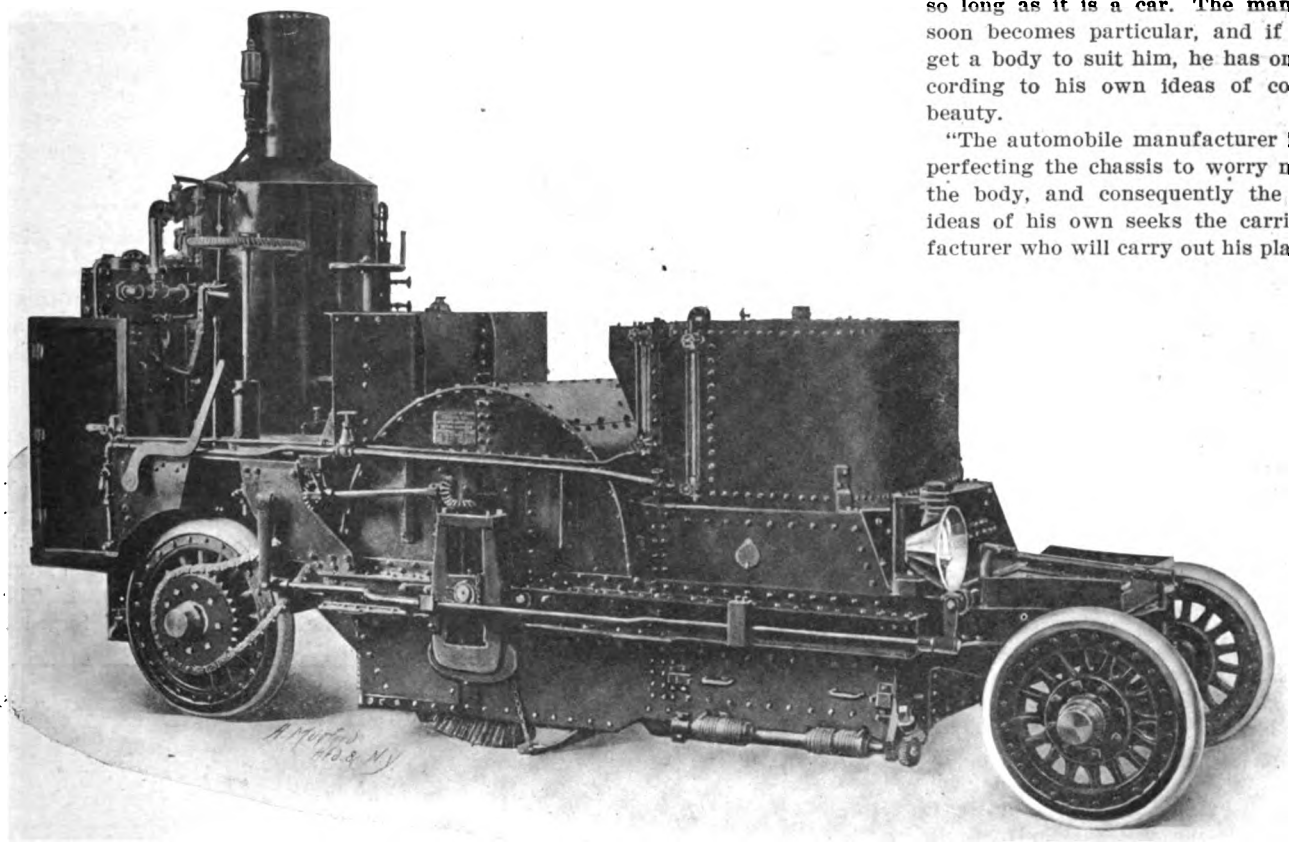
Buck Building a Big Garage.

Davenport, Iowa, is to have a pretentious garage and salesroom. On the corner of Fourth and Ripley streets Patrick Walsh will erect a four story building, fronting 150 feet on Fourth street and 120 feet on Ripley. The three upper stories will consist of twenty-four roomy flats, with all the latest improvements. The first floor and basement will be occupied by the Buck Auto, Carriage and Implement Co. The first floor is to be divided into salesroom, garage and auto repair station. The salesroom will be 150 feet front on Fourth street by 80 feet deep on Ripley. The automobile garage will have a 40 foot front on Ripley, running 150 feet east, and the east fifty feet will be occupied by the repair shop.

The basement, 150x120x10 feet in the clear will be constructed of solid concrete walls and floor. With the exception of a portion of the west end, which will contain the living rooms of the building and the steam plant, the basement will be used as a stock and storage room.

The floor space occupied by the Buck Auto, Carriage and Implement Co. will be 32,500 feet, four times that of their present place of business.

Locks and Keys for Side Doors.



One of the little things worth considering is the equipment of side doors with locks and keys. Several owners of closed cars have had the work done at their own expense, and the idea is so good that there is no reason why it should not be quite generally adopted. It is a check not only to the "borrowing" practices of chauffeurs, but is also a safeguard when for any reason the car is left unattended out of doors.

TO CLEAN THE STREETS

Hartford Offers a Notable Production for the Purpose that Bristles With Ingenuity.

There is promise that street sweeping will soon be robbed of its attendant nuisances. The Hartford automobile street sweeping machine, made by the Hartford Motor Machine Co., of Hartford, Conn., and shown by the accompanying illustration, is the sign of promise.

THE HARTFORD AUTOMOBILE STREET SWEEPING MACHINE.

Its makers assert without reserve that it will traverse any paved street at the rate of four miles an hour, and remove all dirt and dust from its pathway without the emission of smoke, dust or odor; that it gathers all the dust but sends none into the atmosphere. It does its work without having to wet the pavement, leaving it absolutely clean and dry. The dust is dampened as it is taken up by the rotary brush, upon which a current of hot steam is constantly directed, and is thus prevented from passing into the outer air.

A remarkable feature of the machine is that it takes up all the finest dust and retains it, and also all solid matter as large and as heavy as a brick. All dirt and refuse is thrown as gathered by the broom directly into a dirt box large enough to contain two ordinary cartloads. This box is unloaded at the curb, and it may be completely emptied almost instantly. The mechanism by which this process is effected is extremely simple, as is every part of the machine.

Economy of operation, not less than sanitary thoroughness is claimed for this Hartford machine. With an eight-foot sweeper its makers place the cost of operation at $1 per hour of 18,000 square yards of surface, whether asphalt, wood, brick or stone. With a wider brush the relative rate is, of course, greater.

The machine is of steel construction, 16 feet in length, and weighing about 8,000 pounds. It is steered by a wheel like any automobile.

A water-tube boiler and engine located at the rear of the machine furnish the power for moving the machine and for operating the rotary broom. The engine is wholly incased, no moving parts being exposed. Steam is essential in the operation of the Hartford machine, not only as a source of power, but for the complete suppression of the dust, which is one of its features. Oil is used for fuel, and a supply of oil and water sufficient for five hours' work may be taken on at one time. Solid rubber endless tires of the largest dimensions on artillery wheels protect the mechanism of the sweeper from jolting, and obviate all noise in its movement through the streets. Roller bearing hubs in the wheels which require oiling but once an entire season, are also employed.

Carriage Makers Become Interested.

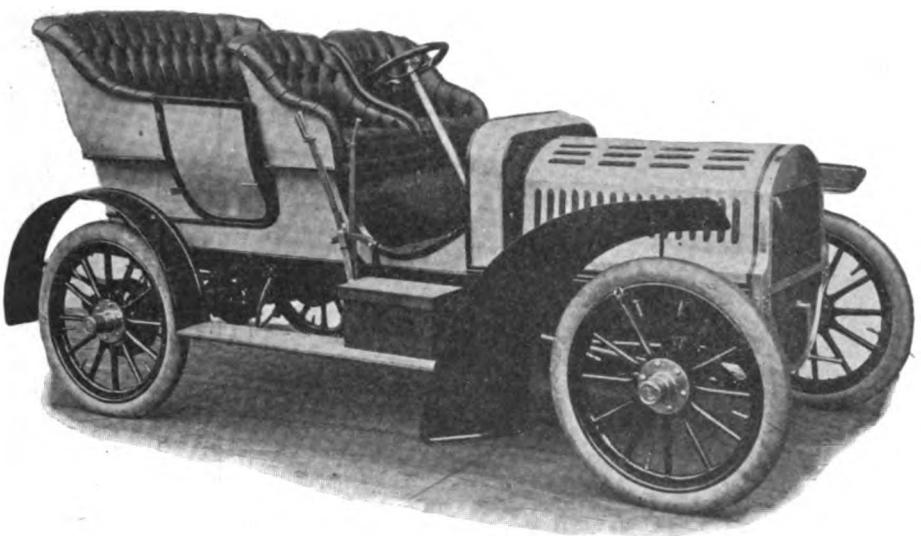
Although carriage builders originally scoffed at the motor vehicle, and thus lost the opportunity to become a factor in its manufacture, they are unwilling to let it slip through their hands entirely. Thus L. E. Burr, secretary of C. P. Kimball & Co., Chicago, in speaking of the automobile, says:

"The day is close at hand when the carriage maker and automobile manufacturer must combine, as in France, and make the automobile together. The automobile manufacturer here is like every Yankee. He wants to get it all. The first car a man buys gets but little notice as to the body—anything so long as it is a car. The man, however, soon becomes particular, and if he cannot get a body to suit him, he has one built according to his own ideas of comfort and beauty.

"The automobile manufacturer is too busy perfecting the chassis to worry much about the body, and consequently the man with ideas of his own seeks the carriage manufacturer who will carry out his plans. Eventually the chassis will be made by the auto manufacturer and the body be left to the carriage maker."

More Bodies in Sight.

By the completion of an addition to their plant the Pontiac Body Co., of Pontiac, Mich., have almost doubled their capacity. This will enable them to relieve the congestion caused by the rush of orders, and which has caused the company considerable annoyance. The new building is 60x100 feet in size, and is constructed of cement block. It is equipped with steam heat and electric lights, and is modern in every detail. A feature is a wide strip of cement bottom, which runs through the centre the entire length of the building, the wood floors extending both sides. This greatly facilitates the handling of jobs, especially the heavy automobile bodies.



C. J. Bronson, Grand Rapids, Mich., has secured the Winton agency for that city, and will enlarge his business in 1905. One or more other makes will probably be added to his line.

Lear Makers Free Use of Aluminum.

Launched by its makers, the Oscar Lear Automobile Co., of Columbus, Ohio, as "a scientific contribution to the cause of air cooling," the Frayer-Miller motor and car, shown by the accompanying illustrations, apparently are entitled to more than passing notice, particularly as the 24 horsepower car weighs but 1,650 pounds.

The motor is a four cylinder, vertical 24 horsepower, each cylinder being surrounded

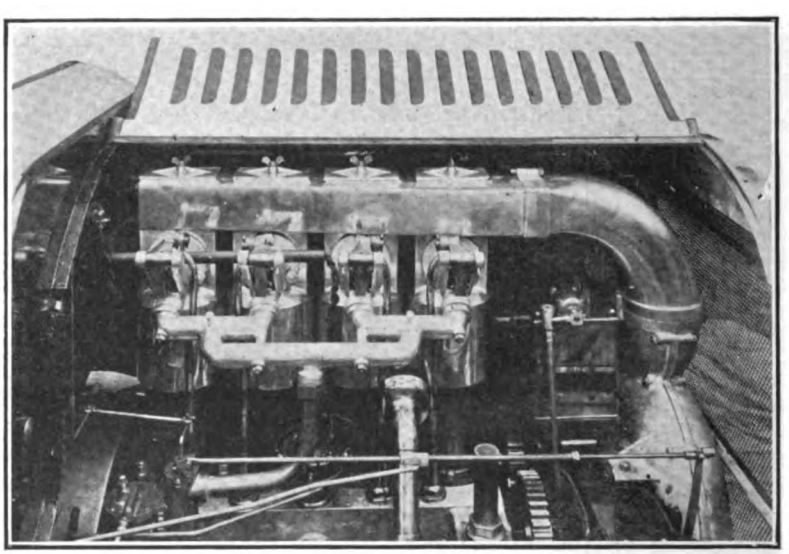
FRAYER-MILLER 24 H. P. TOURING CAR.

with an aluminum jacket open at the top and bottom, leaving a space around the cylinder through which air is driven from a centrifugal blower geared from the engine shaft. A large bustle pipe, also of aluminum, conveys the air from the blower to the top of the jacket. Innumerable spikes are cast on the outside of the engine cylinders, over which the air is blown at a predetermined rate and volume. The effect is the perfect cooling of the cylinder, doing away absolutely with water jackets, the radiator, water piping, pump, water tank and all danger and annoyances connected therewith. Air can be supplied by this method to whatever extent and degree necessary, i. e., it is within controllable limits. The motor remains cool with car standing still on the low gear.

The extensive use of aluminum, the saving effected by the substitution of light aluminum jackets for the heavy cast iron jackets used for water circulation, the elimination of the heavy radiator with its load of water and other savings, makes it possible to produce this car at 1,650 pounds—the lightest weight for 24 horsepower ever heard of. The effect of this on speed and power can be realized, to say nothing of the saving on tires and in amount of fuel used.

The blower is driven by means of spring cushion gears to guard against shocks such as would come from the quick starting of the motor with the spark or other similar causes. The blower is geared four times as fast as the engine. The starting crank is on the blower shaft, making the motor extremely easy to crank over. The blast wheel is made of aluminum throughout, and the blower casting is of the same material. The blower shaft is run on a Babbit bearing, supplied with oil direct from the force of the feed lubricator.

The carbureter is the float feed type, the gas spray nozzle being of the single opening kind, the hot air being drawn from underneath the air jackets.



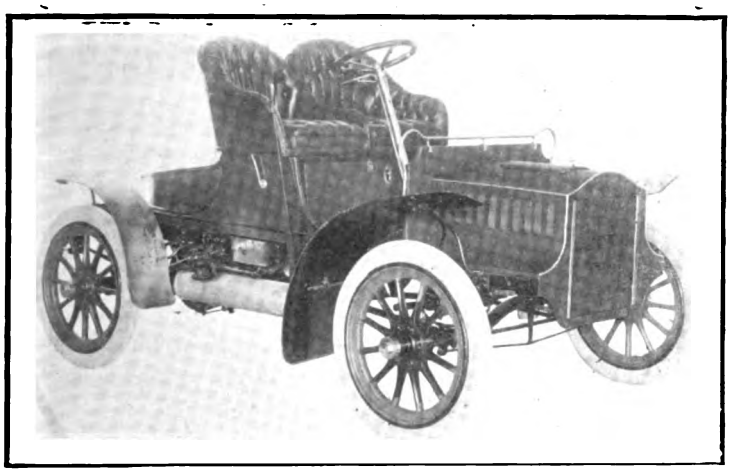
The steering gear is worm and segment type, the worm being quadruple threaded, half-inch pitch, both made of soft steel and case hardened. The steering gear housing is made of steel, bolted rigidly to the sub-frame of the machine.

The transmission case is cast aluminum in two halves. All bearings are of the best semi-babbited bronze type already described. Three speeds forward and one reverse are provided by single lever shift.

Universal joints are self-lubricating. The cardinal cross is made of large diameter, in the centre of which is a large cavity, in which is placed wool waste saturated with heavy oil.

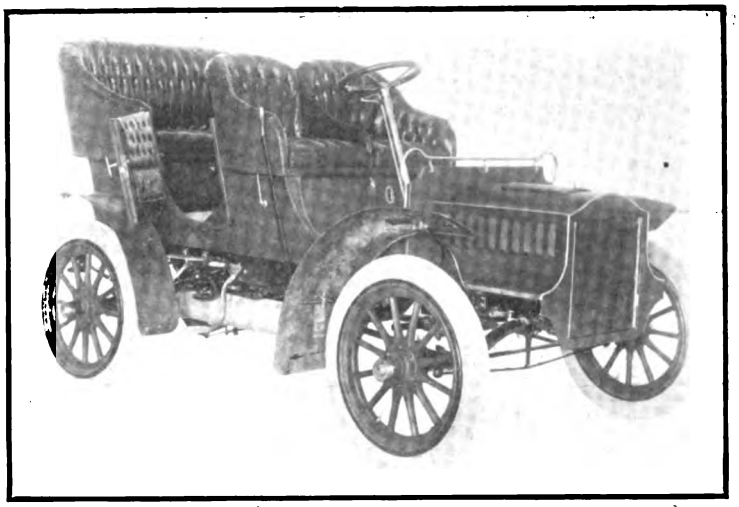
Three point spring suspension is used. The cross spring in front being 2½-inch wide, six leaves, the rear springs being of semi-platform type, 2-inches wide, six leaves. All springs are composed of very thin leaves. The effect of the platform spring and this form of spring suspension is that no matter how light or heavy the load, the maximum amount of comfort is secured. The rear springs are secured by open shackles to prevent the reaction movement as much as possible.

The muffler is of the dash pot type, with drum 6 inches in diameter and 30 inches long. The shell is made of sheet metal 1-16-inch thick; heads are made of steel castings, the muffler being extremely quiet and with no back pressure. The exhaust pipe is 2 inches, with 1-16-inch wall.



FRAYER-MILLER AIR COOLED MOTOR.

One More Aluminum Alloy.



Zinalium is the name of a new aluminium alloy, which has as main substance aluminum, with additions of small quantities of magnesium and zinc. The specific weight of the alloy is given by the technical testing station as 2.6—2.75. The alloy is harder and much more useful for making into sheets and wire than ordinary aluminum. Sheet metal made from the alloy has a draught tenacity of 25—35 kilograms per square millimetre, or twice that of the ordinary alumium. Wire made from the alloy has been stretched with a power of 30—37 kilograms. The zinalium can be filed, planed and forged like steel. The alloy is 10 to 12½ per cent cheaper than ordinary aluminum, and equally impervious to chemical influences; it has at the same time a smaller resistance against an electric current. The material is considered as of special value for the motor industry, and it is said has been largely adopted by leading German concerns.

Work will shortly be started on a new building for Githens Bros., Chicago. It will be twice the size of the present building at No. 1,412-14 Michigan avenue, but will be erected on the same ground.

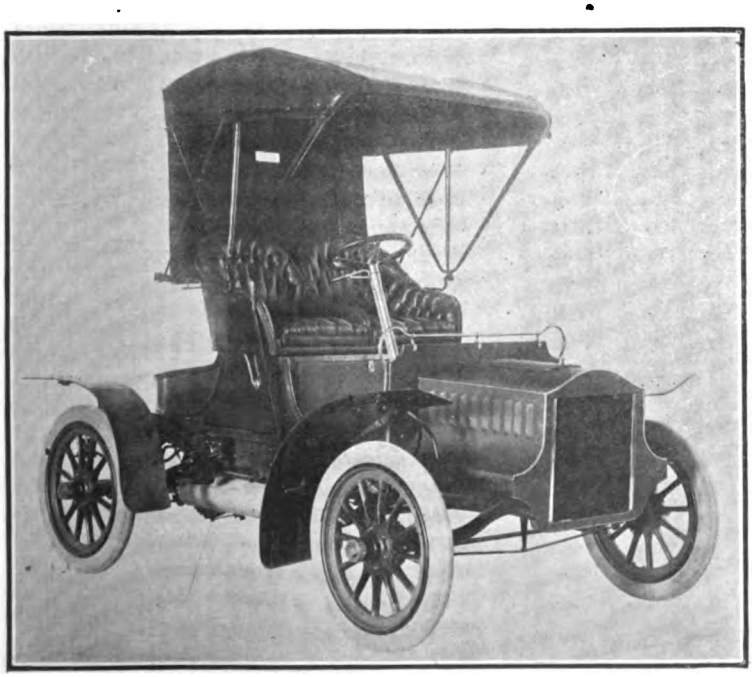
CADILLAC RUNABOUT, MODEL E, $750

CADILLAC TOURING CAR, MODEL F, $950.

While the veil of secrecy regarding the details of the new four vertical cylinder Cadillac still screens it from view, some of the principal specifications have come to light. The engine is rated at 28—30 horsepower, has planetary gearing and will list at $2,800. A flywheel clutch is employed in conection with the gearing, and the three speeds forward and reverse are operated by a single lever.

Exclusive of this, the leading model, the 1905 Cadillac line will consist of the Model B touring car, a Model E runabout, a Model F touring car and a Model F delivery wagon. All of these cars are driven by the famous Cadillac single cylinder horizontal motor, rated at 8¼ horsepower, but developing 10 horsepower.



In the Model F the Detroit concern has a taking looking car, with double side door entrance, 18 inches wide, and individual front seats. A well designed bonnet adorns the front of the car, and 30-inch wheels and 3½-inch tires and a 76-inch wheel base insure smooth running. The front axles are ball and the rear ones roller bearing, while the tread is 56½ inches standard, with an option on a 61-inch. The running gear is finished in primrose. The list price is $950. The Model F is also made as a delivery wagon, the chassis being almost identical with that of the touring model. The front axles of the former are of a pressed steel pattern. The price is the same, $950. The weight is 1,400 pounds, and the capacity 400 to 600 pounds. The inside dimensions of the body are: Length, 42 inches; width, 40 inches, and height, 50 inches.

The 1905 runabout is styled the Model E, made with a top, at $800, and not convertible at $750. Both styles are fitted with 28-inch wheels and 3-inch tires. The wheel base is 74 inches, with a 56½-inch tread (61-inch optional), and the weight is 1,100 pounds. Individual seats, trimmed in hand buffed black leather are used. With rubber top the price is $780.

The Model B is made with a detachable tonneau, and lists at $900. The wheel base is 76 inches and the tread 56½ inches, although a 61-inch tread will be furnished if desired. The wheel are 30 inches, with 3-inch tires, and the car weighs 1,450 pounds.

The standard tire equipment is the Perfected Dunlop, but any standard clincher tire will be furnished if desired.

Platinum of atomic weight 195, specific gravity 21.5, fusing point 1750 degrees, Cent., the most malleable metal known next to gold and silver, resists oxidation at high temperature, and is unaffected by acids. The world's production ranges annually between 160,000 and 170,000 troy ounces, supplied chiefly from Russia, and Colombia, South America. Owing to the war in the Far East the price has advanced so much for ingot platinum at New York that it is now nearly the valuation of gold, and about thirty-four times that of silver.

MODEL E RUNABOUT, WITH TOP, $800.

CADILLAC DELIVERY WAGON, $950.

OLDFIELD IN LOS ANGELES

Again Upsets the Record Table and on a Track that Played Havoc with Tires.

Los Angeles, Cal., Dec. 21.—Following his record-breaking exploits at Fresno on December 13, Barney Oldfield came here last week and performed a few gyrations for our benefit. He was scheduled to race against Frank Kulick and Bert Fuller on Friday. Kulick was to drive the Ford "skeleton," while Fuller was slated to pilot the famous old "999." The Ford was delayed in transit and did not arrive here until late Saturday night. The "999" disappointed everyone, as has frequently been the case in recent months, and did not get here until Saturday, while Fuller, its driver, remained at his home in Denver. The "999" is still at the freight station here.

A "quadrangular motor derby" was accordingly arranged for Friday, with Oldfield, Kulick, Frank A. Garbutt, of this city, and Charles Burman, Oldfield's mecanicien, as competitors. Oldfield won from Burman in the first heat of five miles, one of Burman's tires giving out in the first mile. Oldfield made one mile in 54 seconds, establishing a new record for the track. Oldfield and Garbutt met in the second heat at three miles, Oldfield winning by a small margin. Both drivers kept on for two more miles, Garbutt leading at the end of the fifth mile. Garbutt in his Stewart-Garbutt car, Burman with a 24 horse-power stripped Peerless touring car and Oldfield in the "Green Dragon" made some record trials, but the flinty surface of the track wore the tires out quickly and prevented fast time.

The feature of Saturday's racing was the three-mile event between Garbutt and Burman. They kept together all of the way and Garbutt won in 3 minutes 12 seconds by a narrow margin. It was the most exciting race ever witnessed here. Bert Dingley, in a Pope-Toledo, won the five-mile handicap from Burman in 6 minutes 25 seconds. He had a handicap of three minutes. Burman, whose time for the five miles was 5:17, made one mile in one minute flat. Oldfield tried for the nine-mile record of 8:17, made by Charles Basle, at Providence in September last, but his time was 8 minutes 22 2-5 seconds, owing to trouble with his tires.

The absence of Kulick's racer caused the remainder of the programme to be postponed until Monday, then Tuesday, and the events were finally run off to-day. Kulick could not get the Ford running very well to-day and wore out a set of tires in four miles. He put on a new set, and they were cut badly after going a few miles. Oldfield fitted a new set of tires on the "Green Dragon" and worked on his engine for an hour before trying for the nine-mile record again. He succeeded in taking 13 seconds off Charles Basle's time of 8 minutes 17 seconds. His fastest mile was made in 53 seconds, and he made new records for three miles, and from five to nine miles inclusive. The old and new records from two to nine miles are as follows, Oldfield having held all of them except that for nine miles:

Distance.	Old Record.	Oldfield's Time.
2	1:46	1:46 2-5
3	2:41	2:39 4-5
4	3:33 1-5	3:35
5	4:30	4:29
6	5:25 1-5	5:22 2-5
7	6:18 1-5	6:15 4-5
8	7:13 1-5	7:09 1-5
9	8:17	8:04

Oldfield Under Pickens's Wing.

Barney Oldfield may go through Texas under the management of W. H. Pickens, according to a report from California, where both are at present. Pickens has been acting as advance agent and promoter of the race meets at which Oldfield has been appearing in California since the pilot of the Peerless "Green Dragon" arrived on the Pacific coast. Pickens has been shipping the old "999" around with him and announcing that it would be driven in competition against Oldfield by Bert Fuller, of Denver. Up to date, however, there is no recorded instance that the famous old racing machine has actually appeared against the "Green Dragon." Pickens paid a fine of $250 to the American Automobile Association about a month ago for running the "999" at outlaw meets.

How Jerseyman Enjoy Themselves.

Nearly one hundred members and their friends were present at the first smoker of the New Jersey Automobile and Motor Club, on December 17 last. Corncob pipes, a cold luncheon, singing and monologues were the principal features of the evening's entertainment. There was no set programme, as the smoker was more for the purpose of mutual acquaintance than for enjoying the artists.

The concert was managed by the house committee, which consists of T. H. Dawson, chairman; W. I. Fish, Edward Zusi, Dr. Clement Morris and C. W. Outhout.

Germany Contributes a Queer Ruling.

A German court has just rendered a characteristic decision. It appears that a physician driving in the Grunewald went past a solicitor named Meyerhof so closely and so fast that the lawyer sustained a severe nervous shock. The lawyer summoned the physician. The court declared the shock of seeing the automobile rush by so close could be regarded as a personal injury, and fined the defendant.

Rhode Islanders Make Nominations.

The following ticket has been placed in nomination by the nominating committee of the Rhode Island Automobile Club: For president, Dr. Julian A. Chase; first vice-president, C. Prescott Knight; second vice-president, Darwin Almy; treasurer, Howard D. Wilcox, and secretary, Elliot Flint. The election will be held the first week in January.

FOR THE GLIDDEN TROPHY

Date and Route of First Contest Fixed—Will Replace Endurance Run.

Tuesday, July 11, has been fixed as the date for the start of the first contest for the C. J. Glidden Touring Trophy. The tour will take the place of the annual endurance run of the American Automobile Association. It will start from New York City and continue for two weeks over a course of one thousand miles. The route will be through Stamford, Bridgeport, New Haven, Hartford, Springfield and Worcester to Boston. One day will be spent in a run of one hundred miles around the latter city. Then the tourists will go to the White Mountains, and return to New York City by way of Lowell, Worcester, Lenox, Albany and Poughkeepsie. Two days will be spent in the White Mountains and one in the Berkshires.

These details were settled upon at the first meeting of the committee which has charge of the contest. The meeting was held at the rooms of the Automobile Club of America on Tuesday last. Those present were Harlan W. Whipple, chairman; Dave H. Morris, representing the Automobile Club of America; W. C. Temple, American Automobile Association; W. K. Vanderbilt, jr., Automobile Club of France, and Augustus T. Post, who represented the donor of the trophy. Mr. Glidden is now on his way to the Fiji Islands on his globe girdling tour, and after visiting New Zealand, Tasmania, Australia, Japan and Singapore will come back to this country in time for the start of the contest. He will leave his car at Singapore, and will witness the Bennett Cup race before returning to America.

Each competing car will be credited with a given number of points at the beginning of the tour, and every stop en route for repairs will be penalized at the rate of one point for each minute lost. The cost of repairs will not be counted. The contest is to be decided on stops for repairs and gasolene consumption. The gasolene consumption will be figured on a basis per ton mile. Tire repairs which require stops will not count against competitors. The machine which makes the best combined showing of fewest points lost and least gasolene consumed per ton mile will be declared the winner of the trophy. The runs each day will average less than one hundred miles, and violators of speed laws will be disqualified.

One of the conditions in the deed of gift is that owners of competing cars must either drive their own cars or be passengers during the contest, which is, of course, open to the world. Several entries are expected from England and Continental Europe.

A Berlin paper is authority for the statement that a large motor racing track is to be constructed at Ruhleben, between Charlotenburg and Spandau, Germany.

OLDFIELD'S WORK AT FRESNO

Details of His Record Breaking Performance, Which Resulted in 36 New Figures.

Later advices from Fresno, Cal., give fuller details than were published in last week's Motor World of Barney Oldfield's "track burning" on December 13, when he made new records from fifteen to fifty miles, but no mention is made of burning gasolene to dry out the track. Oldfield had tried the track the previous day, and had declared it was a good one, though a trifle soft on the turns. The misty weather had caused Oldfield to call the races off in the morning, but when the weather cleared up at noon the track champion declared the races on again. Oldfield now holds all the records from one to fifty miles, except that for nine miles, made by Charles Basle.

It was after 3 o'clock when the first event was run off. This was a four-mile trial by Charles Burman, Oldfield's mecanicien, in a stripped Peerless touring car. He covered the distance in 4:13 7-10 seconds, his fastest mile being the last, which was made in 1:02 1-5. This was gravely announced by Advance Agent Pickens as equalling the best record for lightweight cars, though the record is really 55 seconds, made by Frank Kulick in the Ford "skeleton." It was then announced that Oldfield would try for all of the records up to fifty miles in the Peerless "Green Dragon."

The time for his first mile was 56 2-5 seconds, and he took 55 2-5 seconds for each of the following four circuits. The sixth mile, in 54 1-5 seconds, was the fastest one of the fifty. He did not begin to cut into the record table until the fifteenth mile was reached, but from then on he put up an entirely new set of figures. He cut two seconds off his own time for fifteen miles and 20 2-5 seconds off Kiser's record for twenty-five miles. He was nearly five minutes ahead of Gorndt's thirty-mile time. The "Green Dragon" behaved well until the forty-ninth mile, which was covered in 1:05, the last mile being two seconds faster than the previous one. He lowered Gorndt's fifty-mile record by more than seven minutes, it having stood at 55:42.

After Oldfield's ride Burman gave another exhibition, but the machine refused to run more than four miles. The fastest intermediate mile was covered in 1:03 2-5. The last event was a motorcycle race, for which Thomas Yuck and Ben Bresee were entered. The latter's machine would not run, and Harry Babcock, a newsboy, rode against Yuck. Babcock received a handicap of half a mile in the five-mile contest, and won it by a quarter of a mile.

OLDFIELD'S TIME.

*New world's record until the finish.

One of the Americans Who Covets the Bennett Cup.

DR. HAROLD E. THOMAS, OF CHICAGO (AT THE WHEEL), WHO WILL DRIVE A 90 H. P. LOCOMOBILE, NOW BUILDING, IN THE BENNETT CUP RACE OF 1905.

Pardington not to Accept Reappointment.

When the incoming administration of the American Automobile Association assumes the reins of office, it will, in all probability, be called upon to select a new head for the racing board. It is understood that Chairman A. R. Pardington, who has served the association ably and conscientiously in that capacity almost since its inception, will decline to serve another term. The appointment is made by the president, subject to approval by the Board of Governors.

"The King can do no Harm."

A bill has been introduced in the Spanish Senate for the purpose of forcing King Alfonso to desist from driving through the streets of Madrid at a thirty-mile rate of speed. The government, however, acting on the King's request, has refused to pass the bill.

Tinkering with Missouri's Laws.

Three bills which were introduced in the House of Delegates at St. Louis, Mo., on December 16 have the unqualified support of the Automobile Club of St. Louis and the local motorcyclists. The first provides for the identification of automobiles by immovable number plates, placed at the rear of each vehicle, and requires each car to carry a lighted lamp at night which will throw a red light to the rear and a white light upon the number plate. The measure also provides a penalty for duplicate number plates. The second bill places the speed limit at fifteen miles an hour during the day and ten miles an hour at night. The present speed regulation allows eight miles an hour on public thoroughfares and six miles an hour in the park limits.

The third bill makes a radical change in the license fees for motor driven vehicles. At present all are charged $10 a year, even the motor bicycle owners paying that rate. The rates in the proposed ordinance are as follows: Pleasure vehicles, one seat, $3; two seats $5; broughams, three seats, $6; four or more seats, $10. Trucks, delivery wagons or carts, capacity one ton or less, $7; more than one ton, $10. Motor bicycles, $2.

There is also an ordinance pending before the City Council which provides for the examination and registration of chauffeurs. It requires all persons who wish to operate automobiles on the streets of the city to obtain certificates from the inspector of boilers and elevators. A. B. Lambert, president of the local automobile organization, is heartily in favor of the latter measure. He says that the club itself has decided to grant certificates to capable hired chauffeurs, and the members of the club have agreed to employ only chauffeurs who hold certificates.

A Grand Prize

Has been awarded by the Juries of the Louisiana Purchase Exposition Co. to

THE GEORGE N. PIERCE CO.

On its exhibit of

Pierce Automobiles

In recognition of superior quality in workmanship and materials, together with correct engineering and design.

The PIERCE Line for 1905 will include

PIERCE Stanhope, 8 H.P. - - $1200

Great Arrow, 24-28 H.P., Side Entrance, $3500

Great Arrow, 28-32 " " " $4000

Dealers can secure this splendid line now for all unoccupied territory and correspondence to this end is solicited.

CROKER ON FIRE ENGINES.

New York's Chief Points Out the Obstacle to Use of the Self-propelled Machines.

Until some device can be found that will prevent slipping and skidding on ice and snow covered pavements, Chief Edward Croker of the New York Fire Department does not believe the automobile fire engine will prove thoroughly practical. He is, however, a believer in the automobile as an auxiliary, and uses a Columbia touring car as his "chief's wagon" in making his inspection tours and in attending fires where his presence is needed. The car he is using at present was supplied by the city. Croker's previous experience with a small steam carriage that was his own personal property led to the purchase of the larger vehicle.

"The 'self-propellers,'" as Mr. Croker called the automobile fire engine, "are all right so long as they can be run on dry streets," he said when his views were sought, "but they cannot be used over icy streets or over wet wooden and asphalt pavements. One reason is the great weight of the latest patterns of pumping engines, which scale about six tons. If fire engines could be run as slowly as brewery and other heavy trucks are propelled over the streets automobile fire engines would be all right, but, of course, speed is the greatest factor that we seek, only it must be speed with at least a reasonable element of safety.

"While it is often very hard to guide one of the six-ton engines on an icy pavement with three horses pulling it, it can be turned in any direction. If any of the big engines were self-propellers it would be almost impossible to steer it around a sharp corner if it were travelling as fast as a fire engine ought to travel. They have a steam 'self-propeller' up at Boston, but it is used only for second and third alarms, and we cannot afford to have machines in this city that are good only for limited duty. If some way can be found to prevent such heavy machines from slipping on wet or frozen streets I will be one of the first to advocate the use of automobile fire engines. Personally I can get to a fire, especially if it is at any distance, much quicker by using an automobile than I can with a horse and buggy, and accordingly I use an automobile. For such purposes it is the best thing that can be had, but as an 'every day in the year' fire engine, the slipping puts the 'self-propeller' out of our calculations."

A former Bostonian who was told of Chief Croker's remarks about the Boston "self-propeller" said he thought the chief was mistaken. He was of the opinion that the Boston automobile fire engine answered all alarms in its district as regularly as the horse drawn engines. The engine has steel tires, which are provided with soft steel or iron "studs," much like those on non-skidding pneumatic tire covers.

Chief Croker's remarks were brought out in answering questions regarding the probability of a grade of "automobile firemen" being added to his department. According to a daily newspaper, examinations were being held for this alleged new grade, but this is declared to be an error by Chief Croker. He said the examinations referred to were to provide regular drivers for the gasolene touring cars used by himself and Deputy Chief Lally, of Brooklyn. Instead of the examinations being for "automobile firemen," the chief said the Civil Service Commission had announced examinations for "automobile enginemen," the latter term being used in place of the usual term "chauffeur." As the salary provided for the "automobile enginemen" is but $1,200 a year, it has been rather a difficult matter to get men, as the drivers of the chiefs' cars are required to be on duty all of the time.

Made Ready for Tire Trouble.

To meet a demand that has arisen the Hartford Rubber Works Co. have just placed on

the market the tire repair outfit, shown by the accompanying illustration, which is so complete and in such compact and convenient form that it can scarcely fail of ready sale.

This repair outfit includes a B. & S. style of wrench with combination screwdriver, soapstone, cement, a handy tool for roughing the surface of inner tubes, patches, patching cement, wide tape, tire detachers and special pigskin sectional cover to strengthen the tire at the point of repair; friction duck, patching rubber, parts for valves, and in fact everything that is used in making repairs on double tube tires, either in the garage or on the road, all being neatly placed in compartments to prevent general mix-up of contents.

To Hold Auction Monthly.

W. D. Grand, of the American Horse Exchange, Broadway and Fiftieth street, New York, who has conducted an automobile auction sale annually, has found that the idea has met such favor that henceforth he will hold such auctions monthly. The next sale has been set for December 30. Nearly one hundred cars have been already entered. Mr. Grand has arranged to obtain the use of the horse ring, which will permit of actual demonstrations.

SUBSTITUTES FOR RAILWAYS

Ceylon Adopts Automobiles and Success of Experiment Will Lead to Extended Use.

The authorities of Ceylon have finally decided, after considerable cogitation, to establish an automobile service on that island, to carry the mails and passengers for a period of ten years, beginning July 1, 1905, and sealed bids have been advertised for. There will be five routes, the longest of which is from Badulla to Batticaloa, covering a distance of 105 miles, and the automobiles are to make one trip each way per day. An almost equally long trip will be that from Matale to Trincomalee, ninety-seven miles, while the other road on which one trip a day will be made is from Chilaw to Puttalam, thirty-two miles. On the shorter lines—Bandarawela to Badla (18 miles), and Colombo to Chilaw (50 miles) two daily trips will be made.

The Ceylon automobile service is primarily designed to carry the government mails, but will also be adapted to passenger traffic, and, it is presumed, carry light parcels and luggage as well. The automobile service will fill one of Ceylon's long felt wants. Railway communication is practically non-existent in that country, and the towns are situated so far apart that it is extremely difficult, if not well nigh impossible, under present conditions, to traverse the island.

Unless the automobiles are powerful hill climbers trouble is likely to be encountered on the proposed route between Badulla and Bandarawela. The road begins at a point two thousand feet above the sea level, and ascends to four thousand feet. Many of the hills have a grade of 12 to 30 per cent, and to climb this, it would seem, will be no easy task for a heavy automobile loaded with passengers and baggage.

If the automobile service proves a success in Ceylon there is a bare possibility that a similar service will be adopted in India. There are many large tracts in India which are just as badly served by railways as in Ceylon, and in which automobile communication would be equally as beneficial as in the island.

Germany's School for Chauffeurs.

Another school for chauffeurs has been started, this time in Germany by the Automobile Union. The stipulations are that the pupils "must be young, in sound health and possess thoroughly perfect eyesight." In the lessons they will be taught repairing the mechanism, taking to pieces the different parts of the cars, and afterward reassembling them. They will be also instructed in "geography, motor law, the customs regulations and skilful driving."

The last coaching season was the most disappointing Paris ever knew. The popularity of the automobile is assigned as the cause of the wane of coaching.

Digitized by Google

The only dealer who will find fault with the Orient Cars, this season, will be the dealer who hasn't got them.

It is too soon to say that any motor-car has been produced yet that is faultless. But the 1905 Orients will be nearer faultless than any cars that have been made.

There is no exaggeration in that—there is simply a reason for it.

The 1905 Orients are the product of the combined automobile brains of a number of the best men in the business.

These cars have 4-cylinder, vertical, tandem motors, positive air-cooled by an air-blast from a powerful 4-bladed fan and a specially designed system of flanges.

The motors also have Mr. Gaylor's new mechanical valve, which makes them run absolutely without noise.

They will develop *continuously* higher power for the weight of the cars than any other motor you ever saw.

They climbed the steepest hills in Massachusetts last summer, carrying five people (1000 lbs.) and without a single case of over-heated cylinder.

SPECIFICATIONS.

18-20 H. P. Orient. Model G. Price, $2,000.

Body: Tonneau Side Entrance.
Frame: Pressed steel, tapering pattern.
Springs: 40 inch front; 45 inch rear.
Color: Body and Hood Olive Green; Gear Red; Black striping.
Hood: Mercedes type; Aluminum top; Removable.
Seating Capacity: Five persons.
Total Weight: 1650 lbs.
Wheel Base: 96 inches.
Wheel Gauge: Standard 56 inches.
Wheel Diameter: 32 inches.
Axles: 1¼ inch diameter; Touhgened steel.
Tires: 3½ inch International G. & J. Pattern.
Steering: Brass plated steel upright; wood rim wheel.
Brakes: Band and Emergency.
Gasoline Capacity: 10 gallons.
Motor: 4 cylinder, vertical, tandem; Positive Air-cooled.
Cylinders: 4 inch bore; 4¼ inch stroke.
Crank Shaft: 4-throw; 1¼ inches in diameter; 5 extra long bearings.
Cooling: Powerful, 4-bladed, ball bearing fan.
Fly Wheel: 16 inches in diameter; weight, 60 lbs.
Clutch: Cone pattern; Internal grip.
Transmission: Sliding gear pattern in aluminum case; ball bearing.
Ignition: Two four-cell batteries.
Speeds: 3 forward and reverse.
Commutator: Latest French Pattern.
Vibrator: 4-coil; best type.

14-16 H. P. Orient. Model F. Price, $1.500.

Body: Tonneau, Entrance, swinging front seat.
Frame: Pressed steel, tapering pattern.
Springs: 34 inch front; 42 inch rear.
Color: Same as 18-20 H. P. Cars.
Hood: Mercedes Type; Aluminum top; Removable.
Seating Capacity: Five persons.
Total Weight: 1450 lbs.
Weight without Tonneau: 1350 lbs.
Wheel Base: 82 inches.
Wheel Gauge: Standard 56 inches.
Wheel Diameter: 30 inches.
Axles: 1⅛ inch diameter; Toughened steel.
Tires: 3½ inch International G. & J. Pattern.
Steering: Brass plated steel upright; wood rim wheel.
Brakes: Band and Emergency.
Gasoline Capacity: 7 gallons.
Motor: 4 cylinder, vertical, tandem; Positive Air-cooled.
Cylinders: 3¼ inch bore; 4¼ inch stroke.
Crank Shaft: 4 throw; 1⅛ inch diameter; 5 extra long bearings.
Cooling: Powerful 4-bladed, ball bearing fan.
Fly Wheel: 16 inches in diameter; weight 60 lbs.
Clutch: Cone pattern; Internal Grip.
Ignition: Two 4-cell batteries.
Transmission: Sliding Gear Pattern; ball bearing.
Speeds:3 forward and reverse (one-lever).
Commutator: Latest French pattern.
Vibrator: 4 coil; best type.

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builders have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of coolis worth something to our customers.

We are now shipping coolers on our 1905 orders.

THE WHITLOCK COIL PIPE COMPANY

HARTFORD, - CONNECTICUT.

The Week's Patents.

777,219. Elevated Platform or Support for Motor Vehicles, etc. William C. Owen, Ealing, England. Filed March 4, 1904. Serial No. 196,627. (No model.)

Claim.—1. A platform for motor and other road vehicles consisting of two supporting parts a a, held apart at their front and rear ends by suitable bars or rods, and supported by legs at the front and rear ends and at or near the centre, the rear legs being turnable or collapsable so that they can be folded or so placed that the end of the platform can be lowered to rest upon the ground or floor, in order that the vehicle can ascend onto the platform, and then readjusted to their normal position when the greater weight of the vehicle has passed the centre legs and so caused the platform to assume its horizontal position, substantially as and for the purpose herein set forth.

777,220. Carbureter for Explosive Engines. Fred Patee, Indianapolis, Ind. Filed October 24, 1901. Serial No. 79,755. (No model.)

Claim.—1. In a carbureter, the combination with a hydrocarbon retaining vessel, a partitioned chamber supported by said vessel, wicks laced through the partition and extending through a wall of the vessel, into the body thereof, and an inlet-valve for admission of air into the chamber beneath its partition, substantially for the purpose described.

777,229. Power-Transmitting Mechanism. Charles C. Vaughn, San Francisco, Cal., assignor of one-half to George J. McConnell, San Francisco, Cal. Filed March 31, 1904. Serial No. 200,976. (No model.)

Claim.—1. In a power-transmitting mechanism, the combination of a power-shaft, a conical driving-gear slidably mounted thereon, a spring adapted to normally hold said gear in operative position, a lever adapted to withdraw said gear from its operative position, a counter-shaft at right angles to the power-shaft, a pair of pinions feathered on said counter-shaft on opposite sides of said gear, and means for moving said pinions alternately to and from their desired positions of engagement with said gear, consisting of pivotally-connected rods, and a lever for oppositely actuating said rods in unison.

777,260. Stepper Attachment for Automobiles. Henry M. Landes, Sacramento, Cal. Filed March 14, 1904. Serial No. 198,008. (No model.)

Claim 1. In an automobile or the like, the combination with a main propelling motor, of a reciprocating carriage, means independent of the main motor for effecting and controlling the reciprocation of said carriage, and a stepper operatably associated with said carriage.

777,295. Speed-Regulator for Explosive-Engines. George Marx, Jr., Nuremberg, Germany, assignor to The Firm of Vereinigte Maschinenfabrik Augsburg und Mas-

HIGH-GRADE LAMPS

Acetylene Gas and Oil

ATWOOD MFG. CO.,

Amesbury, Mass.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—Winton quad. In best condition, with four hundred dollars worth of extras on it. Very best reason for selling. It will pay you to investigate, if you are comtemplating buying an automobile at a bargain. Address, Room 403, First National Bank Building, Danville, Ill.

WANTED—Fifteen to twenty traveling salesmen by a well-known and established tire manufacturing company, making standard goods. Only active men who know how to work effectively and all the time need apply. Exceptional opportunity for men of the right sort. Address, TIRES, P. O. Box 649, New York.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

SALESMAN.

A machine salesman, age 30, with 7 years' experience, 3 years with automobiles, desires position. Address E. N. B., care MOTOR WORLD.

FOR SALE—16-H. P. four-ton Panhard Levassor Delivery Truck in perfect running order; a splendid machine at a bargain. FAIRMOUNT ENGINEERING WORKS, 2652 Callowhill St., Philadelphia, Pa.

FOR SALE—Bargain: 1903 Winton Touring Car. 32x4 tires, speedometer, long tube horn, three lamps, side baskets; splendid order. Price $1100. Address J. C. WOOD, 1711 14th Street, Washington, D. C.

FOR SALE—Bargains: Oldsmobile Runabouts, $250 to $500; Oldsmobile Touring Car, $800; Cadillac, $500; 2-cyl. Toledo, $800; Orient Runabout, with top, $100; Columbia Electric, $350; Steamers, $50 up. Many others. Send for list. NATIONAL AUTOMOBILE CO., Washington, D. C.

FOR SALE—White 1904 Touring Car; guaranteed in perfect condition and newly painted; $325 worth of extra equipments; price $1400; with top and glass front, $1500. Reason for selling, have bought 1905 White. H. B. MALLORY, Danbury, Conn.

FOR SALE—One 1904 White, with canopy top, nearly new, $1500; one Pope-Hartford, run about 300 miles, $750; three Oldsmobiles, 1903 model, $250, $300 and $400; one Pierce-Motorette, leather top, good repair, $350. AKRON AUTOMOBILE GARAGE, Akron, O.

FOR SALE—1904 model four-cylinder 20 H. P. vertical, air-cooled touring car; seats five. This car was originally a Santos-Dumont, but has been equipped with standard pattern sliding gear transmission, three speeds ahead and reverse; direct drive on high speed; one lever controls all speeds; one foot tread throws out clutch and applies brake; other foot tread throws out clutch and applies emergency brake; throttle and spark advance on steering wheel; car under perfect control; is in fine condition; tires practically as good as new. Write for photograph, further description and prices to A. S. HILL, Kalamazoo, Mich.

FOR SALE—Six latest 1903 Oldsmobile Runabouts, entirely new, fully guranteed. Four more second-hand Oldsmobiles, first class condition. Must be sold at once. Prices reasonable. R. D. CHAPIN, 1312 Jefferson Ave., Detroit, Mich.

Digitized by Google

chinenbaugesellschaft Nurnberg A.-G., Nuremberg, Germany. Filed March 3, 1903. Serial No. 145,968. (No model.)

Claim.—1. In combination, a valve, a lever connected thereto, a movable fulcrum for the said lever comprising a lever w, a governor for controlling the position of the said lever w, mechanism for operating the lever b arranged to be disengaged therefrom, and means for throwing the said mechanism out of engagement with the said lever b at a certain point of the stroke, substantially as described.

777,369. Motor-Vehicle Attachment. Henry Hayes, Denver, Col. Filed May 16, 1904. Serial No. 208,160. (No model.)

Claim 1. The combination with a motor-vehicle, of a figure attached to the front portion of the said vehicle and provided with a swiveled supporting-wheel in front.

2. The combination with a motor-vehicle, of a figure pivotally attached to the front portion of the vehicle, for movement in a verticle plane, said figure having a supporting wheel beneath the forward portion thereof.

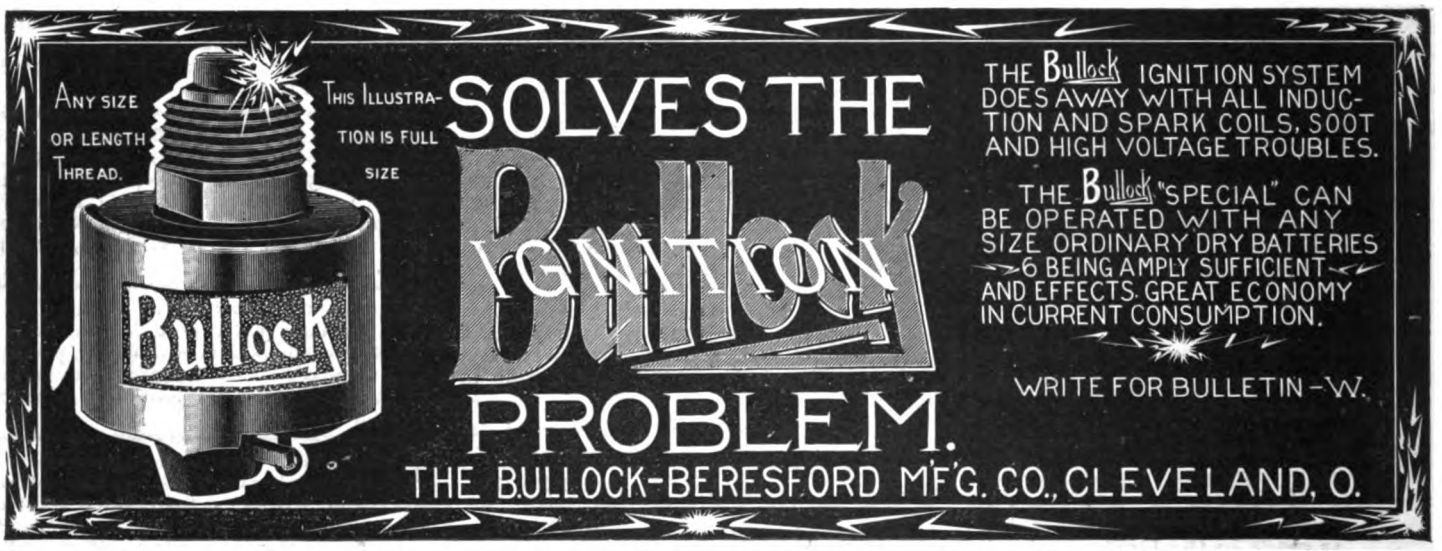
777,457. Battery-Case. Reinhold H. Wappler and Frederick H. Wappler, New York, N. Y. Filed April 20, 1904. Serial No. 204,046. (No model.)

Claim 1. A battery-case, comprising a base and a cover therefor both having series of aligning and corresponding grooves for receiving the battery-cells, means for connecting the cover to the base, parts secured to the base and between which the cover at opposite edges is received, and which means are intermediate of the aforesaid parts, terminals secured to the case, and means for completing the electric circuit between the cells and to the terminals.

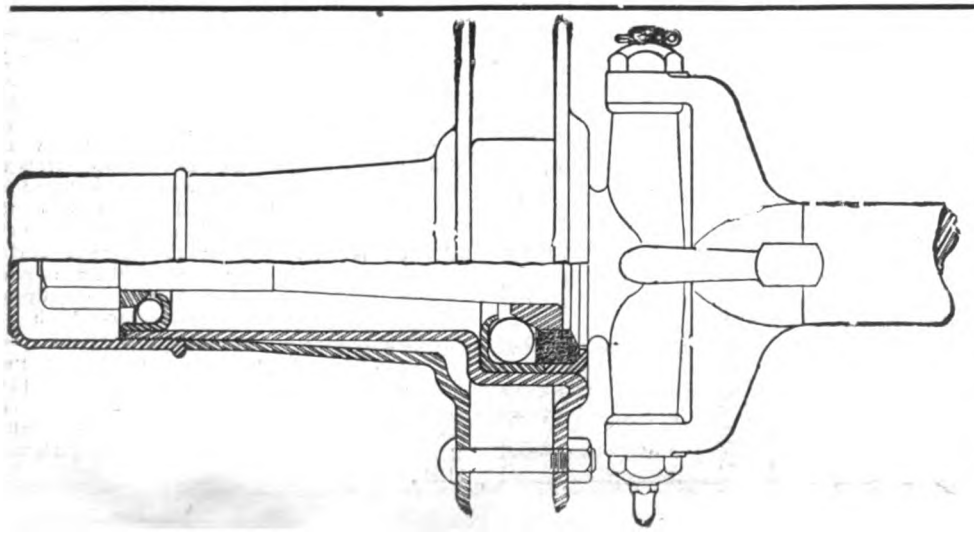
777,571. Casting Apparatus. Herbert G. Underwood, Stamford, Conn, assignor to H. H. Franklin Manufacturing Company, Syracuse, N. Y., a Corporation of New York. Original application filed June 17, 1897. Renewed January 11, 1900. Serial No. 1,145. Divided and this application filed December 8, 1902. Serial No. 134,430. (No model.)

Claim.—1. In a casting apparatus, a source of supply for the material to be cast, an exit-port for communicating with the source of supply, a model having an ingate for communicating with the exit-port, a supporting member for the mould movable relatively to the exit-port, means for forcing the material from the exit-port through the ingate into the mould, a clamping member movable toward and from the supporting member, and movable means connected to the clamping member for actuating the same automatically, substantially as and for the purpose described.

777,578. Hydrocarbon-Burner. George E. Whitney, Boston, Mass., assignor to Whitney Motor Wagon Company, Kittery, Maine. Filed February 4, 1899. Serial No. 706,253. (No model.)



Claim 1. The within described hydrocarbon-burner comprising top and bottom plates normally separated by intervening spacers and held together by tubular members passing through said plates and headed over at the outer face of each, air-supplying tubes arranged within said tubular members and in contact therewith at the bottoms of the latter but separated therefrom at the upper ends of the latter, said tubular members being constructed to furnish communication from the chamber between said plates to the resulting annular space between said tubular members and said air-supplying tubes.



777,617. Inflatable Vehicle-Tire. Jay W. Farnoff, Buffalo, N. Y., assignor of two-thirds to Henry Koons, Buffalo, N. Y.; Edward L. Koons and Mary A. Reiman executors of said Henry Koons, deceased. Filed January 21, 1904. Serial No. 190,028. (No model.)

Claim.—1. An inflatable tire consisting of an annular inner tube, a filling-piece held against the inner circumference of said tube and having lateral extensions, and an outer covering surrounding said tube and the filling-piece and having opposite lateral extensions to fit the extensions on the filling-piece, substantially as set forth.

777,618. Fastening for Vehicle-Tires. Jay W. Farnoff, Buffalo, N. Y., assignor of two-thirds to Henry Koons, Buffalo, N. Y.; Edward L. Koons and Mary A. Reiman, executors of said Henry Koons, deceased. Filed January 21, 1904. Serial No. 190,029. (No model.)

Claim.—The combination of the wheel felly, a metallic band secured to said felly and having its longitudinal marginal portions extending beyond the sides of said felly, a tire having lateral extensions, and channeled locking-hoops embracing said extensions and the said marginal portions of the metallic band.

THESE HUBS are drawn from Sheet Steel.

Extremely light and strong Hubs with a smooth surface for finish are obtained.

Center line of Spokes is close to Steering Head. Smooth and Easy Steering is obtained.

Races are GROUND IN POSITION.

Cones and Cone Seats on Spindles are GROUND TO GAUGE.

We manufacture for the trade only.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

OLDSMOBILE
Proclamation No. 2.

Mr. Buyer:

We ought to know how to build the best automobile of to-day. We have had 20 years' experience, have built more machines than any other maker in the world, and have the largest factories. The crowning triumph of up-to-date American automobile construction, the **100 per cent. plus** of Oldsmobile excellence, is our new

20 H. P. TOURING CAR.

$1400

Here is what we give you at the price:—

SPEED—6 to 40 miles per hour. Has surprising ability to climb hills on high gear.

BODY—Side entrance, heavily upholstered, hand buffed leather.

SEATING CAPACITY—Five passengers. Wheel base 90 inches.

RADIATOR—Honeycomb cooler—unsurpassed for efficiency.

MOTOR—Double opposed, 20 H. P.—cylinders 5¼ x 6 in. Simplest construction. All parts readily accessible. Valve mechanism above cylinders, away from dust and mud. Both valves mechanically operated. Noise of exhaust completely eliminated.

Do you want the discomfort, small power, breakages and trouble of the cheap tonneaus,—the complication, chauffeur and difficult adjustment of the four-cylinder cars? We think not. You want extreme comfort, a side entrance, surplus of power on hills and speed on the level, simplicity of construction, and that well-known Oldsmobile reliability.

It is yours at $1400.00, January Delivery.

Write us or our agents for further information, and place your order early.

THE RECORD OF THE FORD.

Victory after victory is credited to the Ford light racing car. When you consider that this car gets its power from two of our standard type horizontal motors, you must admit it is proof positive of the correctness of the Ford design and construction for speed, strength and power. The Ford cars have established a record in every day use of consistent reliability and unvarying satisfaction.

MODEL B. Price, $2000.00. Henry Ford's Latest and Greatest Success.

A striking example of the distinctive Ford construction. Weight 1710 lbs. Four-cylinder vertical motor developing over 20-horsepower. This gives our car more power for its weight than any car of equal price in the world. Consequently there is less wear on the tires and ample reserve power for steep grades and sandy roads. Wheel base 92 inches direct drive with universal coupling, cylinders 4x5 water cooled; automatic oiling devices with force feed, large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car places this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horsepower, planetary transmission, chain drive, and increased gasoline capacity. The most stylish low-priced car on the market.

SOME GOOD TERRITORY YET FOR LIVE AGENTS. WRITE US TO-DAY FOR FULL INFORMATION.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

IF THE RIM

LESSONS OF 1904

are taken to heart

"SWEDOH" Spring Steel Rims

are likely to be the general equipment of all good machines in 1905.

"SWEDOH" SPRING STEEL RIMS have conclusively demonstrated their superiority by the severest tests in actual service, giving results unattainable with rims made of ordinary stock.

"SWEDOH" SPRING STEEL RIMS are made true and stay true.

True as "SWEDOH" steel is axiomatic.

"The Maxwell"

16 H. P. TOURING CAR
Price, for the Present, $1550

8 H. P. TOURABOUT
Price, for the Present, $700

MAXWELL POINTS

are bound to appeal to you on account of their extreme practical value to the average American automobilist.

The small number of parts in "Maxwell" constructions and the absolute simplicity of each part places these two cars in a class by themselves. If you want an automobile that is to be depended upon—one in which there is "nothing to do but ride" and which is a stranger to the repair shop, then get posted as to the "Maxwell." It is the car for *you.*

NO PUMP. NO CHAIN. Double opposed motor in front under the hood and easily accessible in every part. Transmission case and crank shaft cast in one piece of aluminum. Noiseless, smooth and strong.

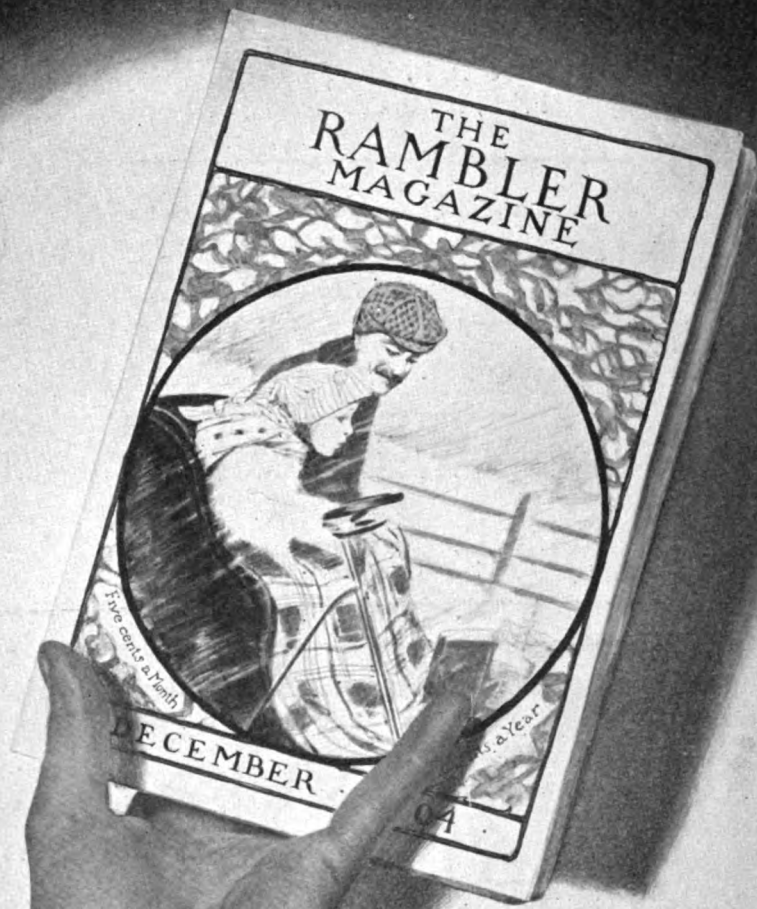
Agencies for 1905 are now being placed.

MAXWELL-BRISCOE MOTOR COMPANY, - Tarrytown, N. Y.

"PUT DOWN 4 AND SUBTRACT 2,"

And any teacher who knows his book and is free from prejudice cannot but tell you that the motor that successfully performs the subtraction and accomplishes with two strokes all that others require four to accomplish is a distinct advance in the art.

The 2-Cycle Motor used in the Elmore Car



is an advance of the sort. There is no lost motion—no useless strokes.

Our booklets will help you to "study up" on the subject. They are free for the asking.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, December 29, 1904. No. 14

WILL GET ITS ROYALTIES

Jury Decides for Electric Vehicle Co. in Case Involving Steering Knuckles.

The Electric Vehicle Co. has won its suit against the Weston-Mott Co., Utica, N. Y., for royalties due under the Elliott steering knuckle patent. The case was tried before Judge Ray and a jury in the United States Circuit Court at Utica on the 23d inst., and a verdict rendered for the plaintiffs for $1,092.67 and costs.

The proceedings in no way involved the validity of the Elliott patent, which has since expired, being in the nature of a non-fulfilment of contract. It appeared from the evidence that on October 25, 1901, the Weston-Mott Co. agreed to recognize the validity of the patent in question and to pay a royalty on each knuckle thereafter produced. Despite the facts, no payments were made, the Weston-Mott people refusing even to state the number of knuckles they had produced and sold until the Electric Vehicle Co. took the matter to the court and compelled the disclosure of the information. The suit for royalties was then instituted.

Argentine Lowers Its Rates.

The Argentine Republic has fixed the duty on finished motor cars and motor vehicles of all kinds, together with spare parts and fittings for the same, at the rate of 10 per cent ad valorem. Hitherto motor cars have paid 50 per cent and other kinds of motor vehicles and parts and fittings paid 5 per cent. To the new duty of 10 per cent must be added the additional duty of 2 per cent, leviable on articles subject to a tariff duty of 10 per cent ad valorem or more.

Here's a Deep, Dark Secret.

Unusual secrecy is being preserved regarding the details of a company formed by capitalists of York and Lancaster, Pa., to manufacture automobiles. Although operations are expected to start next month, and twenty-five four cylinder cars are to be ready for delivery April 1, no names have been made public nor the place of manufacture disclosed. It is said that fifty men will be employed at the start.

November Exports Below the Record.

November was only a fair month for exports of automobiles and parts. The values were slightly less than for November, 1903, viz., $106,117 last month, as against $107,521 a year ago. As a result of this small decrease, and the larger ones of August and September, the showing for the eleven months of the fiscal year is less satisfactory than has been usual. For the eleven months ending November, 1904, $1,682,994 worth of goods were shipped abroad, as compared to $1,419,481 for the corresponding period of 1903, and $1,026,083 in 1902.

Big Jobbers to Enter Field.

The New York Sporting Goods Co., who for several years have been extensive wholesalers of bicycles and cycles accessories, as well as sporting goods, are making ready to embark in the automobile trade, and will do so on a large scale. They have already leased the entire building at 15 Warren street, New York, and obtained the services of Charles Richards, who for very many years has been E. J. Willis's right hand man.

Trying to Revive Fredonia.

It is reported that a plan is on foot to reorganize the Fredonia Mfg. Co., of Youngstown, Ohio, which was overtaken by financial trouble last summer. The plan contemplates supplying the concern with $100,000 capital and having it resume business in 1905.

Gets Tickets for the Show.

The Motor and Accessory Manufacturers have purchased a big block of admission tickets to the New York show, and these will be parceled to members at 25 cents each. There will be no occasion for the latter to negotiate direct with the show management.

Will Use His Own Name.

Henceforth, P. A. Williams, Jr., the well known Boston dealer, who has conducted his business as the Ford Automobile Co., will employ his own name. He will still retain the New England agency for the Ford car, but will handle the Marion, also.

TO CUT OFF COMMISSIONS

New York Dealers Strike at "Rake Off" System—Garage Tariff Waits on Cash Bonds.

Notwithstanding the absence of most of the importing members, who were attending the Paris show, there was a remarkably good attendance on Thursday, December 22, at the meeting and dinner of the New York Automobile Trade Association, which took place at Reisenweiber's cafe. Twenty-four members were present. The knowledge that the schedule of uniform garage rates that had been drawn up by a special committee, details of which appeared in the Motor World several weeks ago, would come up for passage had much to do with the large turnout, and is indicative of the keen interest that is taken in this and kindred subjects.

Contrary to expectations, the new rate schedule was not adopted, consequently it will not become effective on January 1, as was intended. Instead of being sidetracked, however, the measure is merely postponed, and when it comes up again it bids fair to have attached to it a clause that will virtually wipe out the present system of paying commissions to chauffeurs. Furthermore, it is the endeavor of the association to have every member firmly enlisted in support of the standard prices and to provide a method of preventing violations by the filing of cash bonds with it by the members. It was this cash bond feature and the introduction of the commission issue that led to the postponement of the rate schedule.

When the latter was brought before the meeting it was found that every one present was in favor of it. But there were some absent members whose assent had not been secured. It also developed that there was a strong feeling that some effectual method of binding the signatories to the agreement and of providing a penalty for violations must be found if the plan was to prove successful. A cash bond was suggested, and several of the larger concerns represented announced their willingness to make a deposit of $1,000, or even more, with the association, to be forfeited in case any deviation from the rates scheduled was made. The idea met with general favor, but a difference of opinion developed

Digitized by Google

over the amount of the cash bond. Some of the members declared that $1,000 was too large a sum to be taken from their business and locked up. They were doing business on a small capital, they said, and needed all they had in the business itself, and the withdrawal of $1,000 in a lump sum was, in some cases, an impossibility. At the same time, they hastened to add that the plan itself was a good one, and if it could be put through in a modified form it would receive their indorsement.

After a long discussion it was decided to hold the rate schedule in abeyance and to appoint two committees to deal with the matters under discussion. The first of these, consisting of A. Comancho, American Auto Storage Co.; W. M. Haradon, Victor Automobile Co., and J. Sheldon, Locomobile Co. of America, was intrusted with the task of securing the support of the few members who have not yet assented to the plan. The other, its members being C. Andrade, Oldsmobile Co. of New York; Elliot Mason, Pope Mfg. Co., and Secretary Kennedy, was directed to prepare for submission to the association a plan combining a cash bonding system with uniform storage rates. These committees are to report to the association during the New York show.

In the discussion a suggestion was made and received with favor, to the effect that an arrangement be made with the smaller concers whereby they could deposit, say, $250 in cash, and then pay over to the association $1 a month for ten months for each car they have on regular storage, "dead" storage not to be counted. In this way the required $1,000 could be accumulated by graduated stages and without marked inconvenience.

It was at this point that a member suggested that unless some method was taken to prevent it there would be danger of cutting storage rates under the guise of commissions. For example, a member could name the standard rate and then give a commission on the business, and if he had not been in the habit of paying a commission it would be an undoubted cut, yet one so cloaked that it would be exceedingly difficult to convict the offender of a violation of the agreement.

This precipitated a discussion of the commission business in general. As showing the change that has taken place since the subject came up for discussion a year ago, with the result of almost disrupting the association, it is noteworthy that the system of paying commissions had no outspoken advocates. The general opinion seemed to be that the practice had been abused, and that it could well be dispensed with. The only stipulation was that it must be abandoned by all. Provided that their competitors did this, each speaker announced the willingness of his concern to also discontinue the practice. As for the absent members—most of them, it will be remembered, being importers — enough was known concerning their views to render it certain that they would interpose no objection to the abandonment of the system.

It was made plain in the course of the discussion that it was commissions on storage cars and repairs that were aimed at, and not commissions on sales of cars. The latter are, of course, regarded as entirely legitimate and inseparable from the business of the association's members.

To a Motor World man Secretary Kennedy stated that efforts would be made to reach an early settlement of the matters under consideration. April 1 is the date now set for putting the new rates into effect.

The Week's Incorporations.

Detroit, Mich.—International Automobile Co., under Michigan laws, with $25,000 capital.

Brooklyn, N. Y.—The Hoyt Motor Co., under New York laws, with $100,000 capital. Directors—G. H. B. Hoyt, F. E. Kruger and G. A. Phail.

Rochester, N. Y.—United States Automobile Co., under New York laws, with a capital of $200,000. Directors—H. S. Woodworth, H. H. Love and J. A. Borhile.

Colorado Springs, Colo.—The Miller & Wilson Automobile Co., under Colorado laws, with $10,000 capital. Directors—R. A. Miller, H. A. Wilson and L. B. Miller.

New York, N. Y.—International Motor Car Supply Co., under New York laws, with a capital of $25,000. Directors—R. E. Jarrige, Louis Frankel and Richard Ely.

Rochester, N. Y.—The United States Automobile Co., under New York laws, with a capital of $200,000. Incorporators and directors—H. S. Woodworth, H. H. Love and John A. Borhite.

Wilson, N. C.—The Wilson Auto Transit Co., under North Carolina laws, with $100,000 capital, to operate automobile and electric car lines. Incorporators—W. B. Young, J. C. Hales and W. B. Kincaid.

Buffalo, N. Y.—The Frontier Gasoline Motor Co., under New York laws, with a capital of $10,000, to manufacture, lease and sell gasolene motors. Directors—Louis Ducro, W. H. Ahlers, George F. Graf and Oscar R. Cheney.

New York, N. Y.—The D. W. Payne Controller & Engineering Co., under New York laws, with $48,000 capital; to manufacture motors. Incorporators and directors for the first year—E. P. Hampson, W. A. Robinson and D. W. Payne.

Detroit, Mich.—The Reliance Motor Car Co., under Michigan laws, with a capital of $400,000. Incorporators—J. M. Mulkey, Fred O. Paige, Sydney T. Miller, William H. Miller, Hugh O'Connor, E. J. Davis, George C. Wetherbee, John V. White, Luck H. Bliss, J. T. Lynn, John B. Corliss, Frank R. Tharll, D. O. Paige and others.

In the Retail World.

The Pioneer Automobile Company, Benton Harbor, Mich., will open a garage on Elm street. The concern will handle the Olds line.

Abe Levi will, about January 1, open a salesroom and garage at Middletown, Ohio. Both automobiles and sporting goods will be carried.

A certificate has been filed with the New York Secretary of State by the Troy Automobile Exchange, to the effect that its capital stock of $5,000 has been paid in.

The agency for the White car has been secured by the Michigan Automobile Co., of Grand Rapids, Mich. Western Michigan is the company's territory on these cars.

The Motor Car Co., Newark, N. J., has added two new cars to its 1905 line, viz., the Winton and the Packard. The Cadillac and Autocar will be handled, as in the past.

W. S. Hartsough will open a garage at Aberdeen, S. D., in the building at No. 506 South Main street. He was formerly in charge of the repair shop of the Pence Automobile Co., of Minneapolis, Minn.

The Houston Motor Car Co. has been formed at Houston, Tex., and established itself at Nos. 1,013-15 Main street. A general sales and garage business will be conducted.

On January 1 the Southern Automobile Co., of Nashville, Tenn., will move into their new quarters at No. 167 North College st. The place is now being fitted up as an up-to-date garage, and will have space to store forty cars.

The Reo Automobile Co. is the style of a new concern just organized in Chicago with C. H. Foster as president. A company of the same name has also been formed in Cleveland, Ohio, but its personnel has not yet been disclosed.

Williams to Take a Partner.

P. A. Williams, Jr., New England distributor of Ford and Marion cars, takes unto himself a partner on Saturday next in the person of Miss Helena Clancey, of Brookline, Mass.

As everyone who knows Williams knows he does not let grass grow under his feet, therefore when he avers that the first two days following his marriage will be devoted to the endeavor to land a $5,000 order for "delivery wagons," the shock that would ordinarily be caused by such a statement is considerably softened.

Thereafter, according to Mr. Williams, the honeymoon proper will begin and will include an attendance at the Ormond, Florida, races.

Doctors Disagree; Courts Will Decide.

Two prominent physicians of Milwaukee, Wis., are involved in a legal tangle wherein an automobile plays a conspicuous part. Dr. John Bruess asserts that the car was sold him for $400, of which he paid $225 and gave notes for the remaining $175. He claimed that the machine was in bad condition and cost him more than the amount due for repairs, and therefore refused payment on the notes. Dr. R. J. Fleischer, who sold the car, would not pay for the repairs, and brought suit for the amount due him, while his opponent entered a counter claim for $500 damages.

THEY SAW THE SIGNS

Pope Exhibit in Paris Caused "Misgivings" and Gave Frenchmen Food for Reflection.

As being the first American car designed along what are usually spoken of as French lines, and therefore directly conflicting with the home product, the Pope-Toledos exhibited at the Paris Salon have attracted a considerable amount of attention. If they have not created a sensation, they have at least been closely scrutinized and received with respectful attention. In some quarters extremely favorable comments have been made, although French tradesmen are, of course, chary of giving expression to their opinions. A correspondent of the Paris Herald voices some of these opinions when he says:

"There can be no doubt whatever about the fact that the Pope-Toledo automobiles, brought over from America at enormous expense to illustrate to the French manufacturers the progress that has been made in automobile construction outside Paris, have caused considerable misgivings in certain quarters. That is to say, their general excellence is so pronounced that French makers who have relied very largely on American custom for the disposal of their outputs have been made to see that they will shortly have to look up trade elsewhere.

"It can hardly be said that the Pope machines rank with the first four French makes, but it is obvious to any one after a close inspection that nothing in Europe can be produced to equal them at the price. These machines are made in enormous numbers, and though to some people this fact would be damning, to those who consider the matter carefully it becomes plain that in the end all makers will have to adopt the same method if they are to bring their prices within tolerable bounds.

"The workmanship throughout is of such a character as to give confidence to the purchaser, and especially is this the case in respect of the coachwork, which is made by the Pope people themselves. A handsome Pullman saloon on one of the 50 horse-power chassis has been surrounded daily by interested crowds, who talked of the 'comfortable' of it, and tried the 'comfortable' to such an extent that if it is not soon removed by some purchaser it will require re-upholstering."

Will Continue Three Garages in Rochester.

Prominent Rochester (N. Y.) business men, headed by Harry S. Woodworth, the well known motorist of that city, have organized a company of more than ordinary financial strength and ambitious scope. It was originally intended to be called the General Automobile Co., and incorporation papers bearing that name were filed at Albany. Owing to the fact, however, that there is a company of that name operating in this city, it was decided to use the title The United States Automobile Co., and incorporation papers under this style have been filed.

The concern is incorporated with a capital of $200,000, and has organized with these officers: President, Harry S. Woodworth; treasurer, Henry H. Love; secretary, Austin F. Crittenden; directors, Harry S. Woodworth, J. Foster Warner, Charles F. Garfield, John A. Barhite and Austin F. Crittenden, of Rochester, and Henry G. Day, of Providence.

Of the $200,000 capital, $100,000 is 6 per cent. cumulative convertible stock and $100,000 common. The company will deal in automobiles and accessories, conduct a rental and repairing business, etc. It has secured a lease of a store at the intersection of Main street east and Elm street, which will be used as a show room for the exhibition of cars and the sale of commodities. Three garages will be constructed, one in the heart of the city, another at the eastern end of East Avenue and the third on Main street west.

Price was $150 Too Low.

Due to a confusion of figures in their advertisement in the Motor World last week, the Waltham Mfg. Co. has had a flood of inquiries respecting their 16—14 horsepower light touring car, Model F. The price given was $1,500; it should have been $1,650. The lesser figure is the price of the touring runabout, Model E, which, like Model F, is one of the notable additions to the Orient line, which is to be pushed with unwonted vigor in 1905. In giving announcement to this latter fact, the advertisement made it appear that the vigor would be applied in 1895—a mistake manifest on its face. The record of the Waltham Mfg. Co. is not a behind the times record, and when the full line for 1905 is disclosed it is stated that it will be found so complete and so up to date that the "sitting up and taking notice" will be general and noticeable.

Pope Transforms Another Car.

Like the Pope-Hartford, the Pope-Tribune car, which latter is produced at the Pope Mfg. Co.'s Hagerstown plant, has undergone a complete transformation. It bears no resemblance to the former model, being of the two cylinder vertical, water jacketed type, instead of a single cylinder air cooled, as before. A float feed carburetter, bevel gear drive, individual clutch transmission, giving three speeds forward and one reverse, are among the other specifications. The body will have bucket front seats and have a detachable side entrance tonneau.

Bicyclist Sues for Big Damages.

The Automobile Livery Co., of Los Angeles, Cal., is the defendant in a suit filed in the Superior Court of that city by Thomas H. Walsh, claiming damages in the sum of $5,790. Walsh alleges that while riding a bicycle along Spring street on December 4 last he was run down and thrown from his bicycle, whereby he sustained a broken leg besides other lesser injuries.

RELIANCE IS REORGANIZED

Detroit Concern Gets Fresh Capital and Makes a New Start Auspiciously.

Still another addition to Detroit's big automobile manufacturing concerns is promised as a result of the reorganization of the Reliance Automobile Manufacturing Co., which has just been announced. New capital has been secured, and the company's name changed to the Reliance Motor Car Co. Preparations are now being made to increase the force of workmen to 300 and to turn out 1,000 cars during 1905.

The new incorporation begins business with a capital of $400,000 and under the presidency of J. M. Mulkey, widely known as the president of the Detroit Salt Co., and a directory consisting of Fred O. Paige, State manager of the Mutual Life Insurance Co. of New York, vice-president; Frank R. Thrall, secretary and general manager; James T. Lynn, largely interested in gas and electric lighting; Sidney T. Miller, lawyer and capitalist; Hugh O'Connor, president Michigan Wire Cloth Co.; Geo. C. Wetherbee, manufacturer and wholesale woodenware.

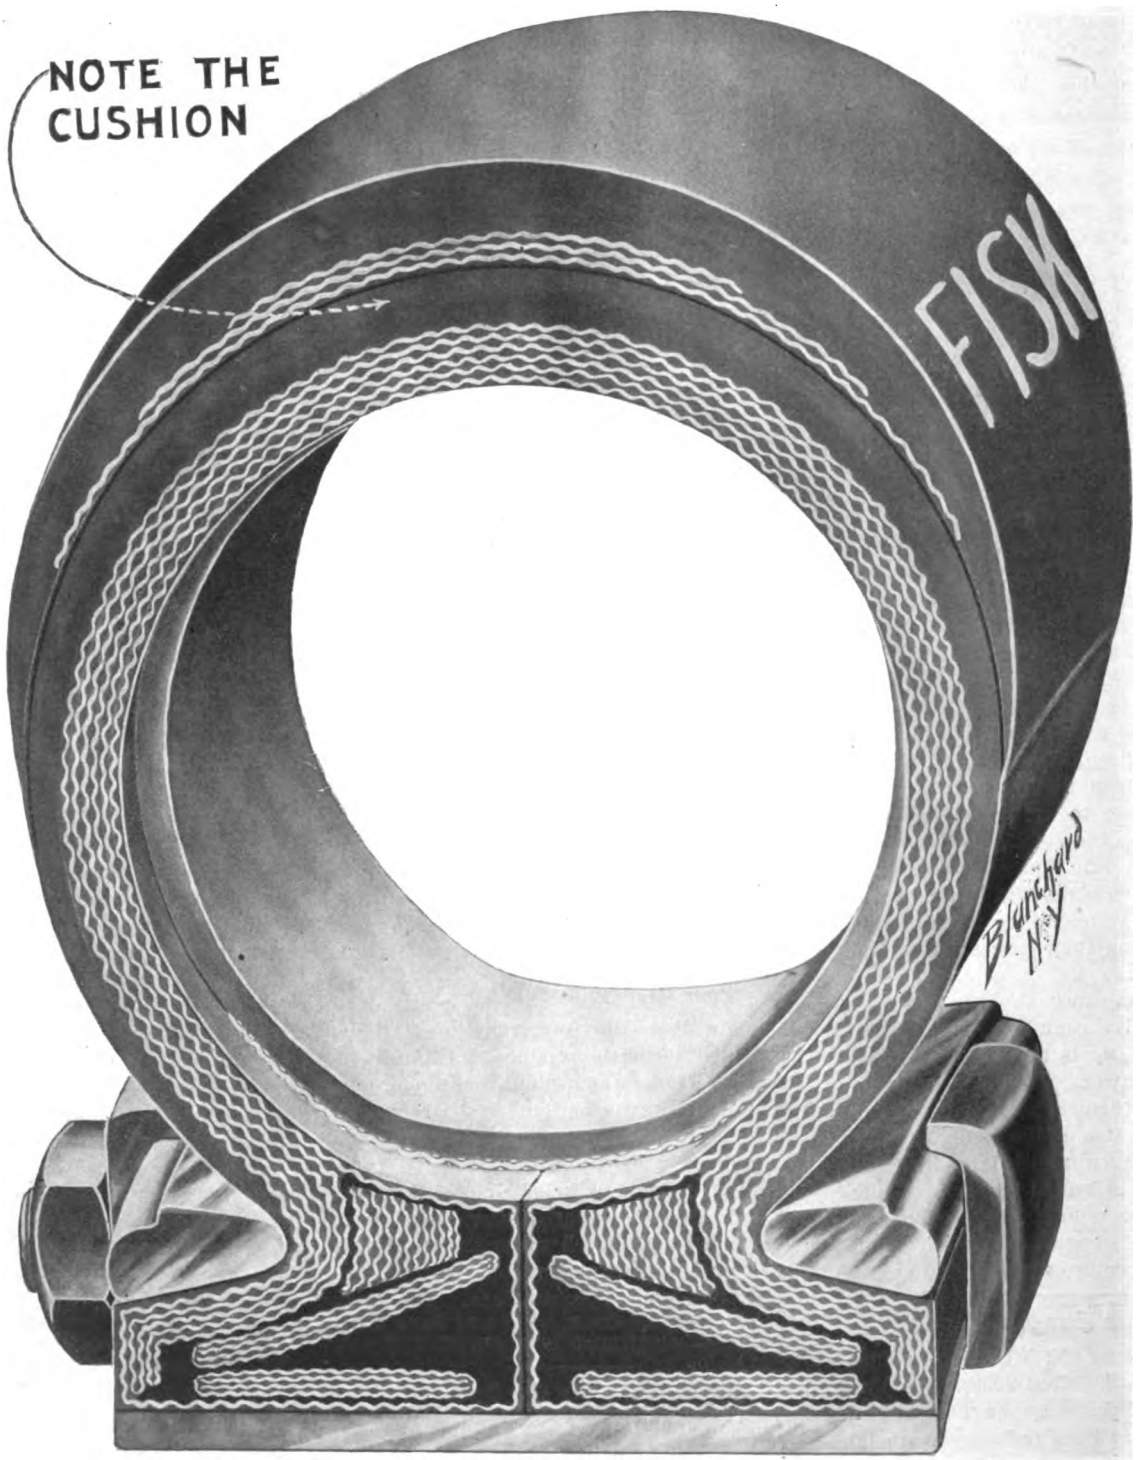
Frank R. Thrall, the new vice-president, was for twelve years vice-president and actively engaged in the management of the Muncie Wheel & Jobbing Co., Muncie, Ind.

The business will be carried on at the old plant, 67-89 Fort street east, Detroit. It consists of thre large, brightly lighted floors, affording over 152,000 square feet of floor space.

Chauffeurs Favor an Age Limit.

Drivers of automobiles in the rental service should be at least old enough to vote, according to the tenets of the California Chauffeurs' Association. The association has appointed a committee to ask the San Francisco Police Commission that such a rule be established. The members of the association have been divided into three classes. In the first class are placed those competent to handle four cylinder cars. In the second are the two cylinder experts, and in the third are the one cylinder or runabout operators. Several of the San Francisco dealers are supporting the association in their age limit petition and classification arrangement.

Olds Agent Wins Big Wager.



Maurice Fournier, brother of Henri Fournier, returned to Paris on December 21 after completing his tour of 5,000 kilometres (3,125 miles), in twenty days in an Oldsmobile runabout. The trip was undertaken as the result of a wager between Henri Fournier and M. Destrelle of 100,000 francs that the Oldsmobile could not travel 5,000 kilometres in twenty days. The trip was successful. The route covered was through Bordeaux, the Riviera, Italy, Austria, Switzerland, Germany and Belgium.

THE MOTOR WORLD

Published Every Thursday by

THE GOODMAN COMPANY

94-95-96 TRIBUNE BUILDING

154 Nassau Street,

NEW YORK, N. Y.

TELEPHONE, 2652 JOHN.

Subscription, Per Annum [Postage Paid] $2.00
Single Copies [Postage Paid] . . . 10 Cents
Foreign Subscription $3.00

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but *not* for advertisements. Checks, Drafts and Money Orders should be made payable to THE GOODMAN COMPANY.

General Agents: The American News Co., New York City, and its branches.

☞ Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceeding the date of publication.

☞ Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, DECEMBER 29, 1904.

The New York Show Numbers of the Motor World will be of date January 12 and 19. As always, they will deal with the Show in comprehensive fashion, and, if anything, will be even more than usually informing in character.

What the Year Wrought.

In preparing to turn over the proverbial new leaf, a glance at the pages of the past year reveals more of interest and instruction than the busy man in the bustling workaway world is inclined to believe is to be found there. Events succeed each other so rapidly that only the more volcanic are more than vaguely remembered. In this way Time leaves its footprints and movements attain force almost before it is realized that they are in motion. Perhaps the best example of the sort is the transformation of the model which only one year ago stood as the typical American car.

A year ago, in reviewing the events of the previous twelve months, we stated that the car which, more than any other, was typical of the American industry was one with a single or double cylinder, horizontal engine, placed in the centre of the car. Since then an almost complete transformation has taken place; a transformation that has, in the rush of crowding events, been almost unnoticed, or only dimly perceived. In the short space of a year a virtual revolution has been accomplished. The vertical cylinder engine, placed in front, has made gigantic strides, and if the horizontal, centrally positioned type has not been crowded out, it has been relegated to a secondary position. To-day there is to be found scarcely a maker who has not prepared for the 1905 market a car with its engine mounted under a bonnet. In an overwhelming majority of cases this engine has vertical cylinders; but in some of them the double opposed horizontal engine, transversely disposed, has been given the preference.

This virtually marks the end of an era. We have almost passed the transition stage, and while for a long time the horizontal motor, and especially in its opposed form, will be found on American cars, it will be in a decided minority. In future the standard type here will be, as it has for years been in Europe, a car having a vertical motor with multiple cylinders. Coincident with its appearance is the disappearance of the horseless carriage type of automobile. However views as to its permanency or utility may differ, the evolution of the new type has been completed, and everywhere it finds acceptance as the most approved form of the modern motor vehicle.

This transformation of the automobile has been much more complete in the case of the runabout, using the term in the sense of two or three years ago. Henceforth such a car will be little more than a memory. Whether the future two passenger vehicle shall be known as a runabout, a touring runabout or a light touring car is immaterial; the important part is that in design and construction the two and four or more passenger cars will be almost indistinguishable. That is to say, both will have bonnets, long wheel base and wheel steer. The change to a tonneau or side entrance body will transform a two passenger car into one seating four or five, or the latter type will undergo a like metomorphosis—reversed, of course—by the substitution of a body with a single seat for a double seated one. This point of convertibility will hereafter be a more important one, especially in the moderately powered and priced models.

The development of bodies especially adapted for use on automobiles, and particularly touring automobiles, has gone on apace. A year ago came the first awakening from the general indifference regarding bodies that had prevailed for so long. The open, unprotected body was replaced by a multitude of forms, ranging from sunshades and folding tops to entirely inclosed productions produced by experienced coachmakers. During the year experience has revealed many shortcomings and defects, and at the same time has pointed the way to many improvements designed to add to the comfort, pleasure and safety of the occupants of the cars. The rear entrance tonneau, long almost the universal type for four or more passenger cars, has been displaced by the side entrance style; and as this permits the use of either the surrey or tonneau kind of seats, a wide variety of styles have made their appearance. Taken as a whole, the art of body building as applied to automobiles has shown great advancement, and motorists in 1905 will find themselves much better served in this respect than they ever have been in the past.

The upward tendency in powers, prices and weights continues unabated. There is a wider range of each than ever before, although the expansion has not affected the lighter classes of vehicles to anywhere near so great an extent as the medium and heavy weights. Where a year ago touring car powers averaged under 20 horsepower, they now exceed that amount. Such ratings as 24, 28, 30 and 35 horsepower have become quite usual, and 40's and even 50's crop up occasionally. They are, of course, the outcome of a desire to supply the demand for an adequately equipped touring car that will prove itself equal to all demands made on it, regardless of the character of the roads or their gradients.

The passing of the single tube tire, referred to a year ago, has been accomplished. The clincher type of wheel covering now reigns supreme. Its design is undergoing modification, through the increasing desire to make the methods of fastening purely mechanical, instead of, as in the past, depending partly on the inflation of the inner tube. The increase in wheel and tire diameters still continues, and with good results. Another significant manifestation is the increasing attention given to non-slipping covers or treads.

Although the exports of automobiles and parts have continued to increase, the gain has not kept pace with that of previous years.

Digitized by Google

The total for 1904 will be only about 15 per cent greater than that of 1903, whereas the latter exceeded that of 1902 by about 50 per cent. The meaning of this can easily be read between the lines. Formerly our exports consisted almost entirely of small cars —many of them steam runabouts. We still hold the bulk of that trade, but it is diminishing, and this decrease is reflected in our proportionately falling exports. There is every reason to believe, however, that we shall shortly begin to export touring cars in larger quantities, and when that movement begins the export values will again swell.

The year has seen the close welding of the Association of Licensed Automobile Manufacturers. There is no longer lukewarmness or perfunctory interest in its ranks. The members have all become thoroughly imbued with the spirit of its objects and are co-operating to a degree not previously thought possible. At the same time, the association has lost its bugaboolsh aspect to those outside the fold, and whatever may be the ultimate outcome of the litigation based on the Selden patent, it is now seen that the A. L. A. M. has not proved a detriment to or in restraint of trade. Without regard to the merits of the litigation, such influence as it has exerted has been good influence. Not even its bitter antagonist can deny the fact. And not the least of its good effects has been the wholesome check on the vulturelike company promoter. Concerns of standing have not been deterred from embarking in the trade. But the way of the professional promoter, who waves the "millions in it" wand, if it has not been made impossible, has been rendered unusually difficult, to the great good of the whole industry. Given freer rein, the great multiplicity of factories and the consequent overproduction which follows in his wake and which spells stagnation or ruin probably would be now in sight. His most notable effort of the year, the formation of a so-called "independent manufacturers' association," ended in a sorry fiasco. The independents have fought shy of such tempters, and the more substantial of them appear able and willing to paddle their own canoes without fear of obstacles.

Although no regularly designated endurance contest—such as marked the seasons of 1901, 1902 and 1903—was held this year, the tour to St. Louis proved to be a worthy successor to these successful enterprises. What the latter did for the industry and pastime was duplicated by the semi-transcontinental journey to the junction of the Missouri River to the Father of Waters. Not even the soul trying contest of 1903, with its troubled progress over mountain trails, amid torrential rains, surpassed it as a convincing testimonial to the surpassing excellence of modern automobiles. While favored with good weather for the major part of the distance, the expanse of country traversed was so great and the variety of roads—real and alleged—so infinite that the arrival of the tourists at their destination in practically undiminished numbers was a marvellous performance. It demonstrated beyond cavil that even the worst American highways possessed no terrors for well designed and soundly constructed cars.

Almost equally convincing was the result of the commercial vehicle test conducted in the spring under the auspices of the Automobile Club of America. It made plain that the self-propelled delivery wagon has reached a stage where it is eminently practicable. No scrutiny of costs, no comparison of service made by unbelieving superintendents accustomed to horse drawn delivery of goods need now be feared. In the contest under notice the contesting vehicles were turned over to express companies and put into service cheek by jowl with horse drawn wagons; and they proved themselves to be fully as reliable and far more speedy and efficient, as well as cheaper, than the latter.

It is distinctly disappointing, in view of this and other equally convincing tests, to note the small number of makers who are interesting themselves in the manufacture and marketing of the gasolene type of commercial wagons. Only one concern has gone into the matter in earnest. That this concern has been successful beyond all expectations should spur those who are moving halfheartedly in the matter to renewed efforts.

In the domain of racing much has been accomplished. The American industry has, during the last year, tasted the bitter and the sweet. On the road the miserable fiasco of the Bennett Cup trials was without mitigation of any kind; but the Vanderbilt Cup race, run on Long Island roads in October last, had its compensations. It proved that American cars were at least reliable, and only needed to be endowed with power akin to that of their foreign rivals to emulate them in the field which hitherto had been regarded as their own.

On the track we wellnigh carried all before us. The race meets of the year have brought to the front a plenitude of both cars and drivers of high class. As a consequence the merry game of record breaking has gone on with little interruption, until the close of the season finds them where they will not be easy to displace. Of the drivers, Oldfield will be accorded the palm with practical unanimity. His utter rout of the pick of the foreign cars and drivers at the Empire City track more than made amends for his reverse of a week earlier, and he closes the season fittingly in possession of almost the entire record table.

Wonders were wrought on the Florida beach last January, and the 39 seconds for the mile, accomplished by W. K. Vanderbilt, jr., is still unapproached, being world's record for either a straightaway or circular course, although it is not, strictly speaking, either a road or a track record. It is, however, considerably faster than either the mile or the kilometre European record.

COMING EVENTS.

Jan. 11-15—New York, Importers' Show, Herald Square Exhibition Hall.

Jan. 13—New York, Motor and Accessory Manufacturers, annual meeting, Hotel Astor.

Jan. 14-21—New York, National Show, Madison Square Garden.

Jan. 16—New York, American Automobile Association, annual meeting and election.

Jan. 19—New York, Superintendents' and Engineers' Branch of the Association of Licensed Automobile Manufacturers, meeting.

Jan. 20—New York, National Association of Automobile Manufacturers, smoker.

Jan. 21—New York, National Association of Automobile Manufacturers, annual meeting.

Jan. 21—New York, Automobile Club of America, annual banquet, Astor Gallery, Waldorf-Astoria.

Jan. 23-28—Ormond-Daytona, Fla., third annual speed carnival.

Jan. 23-28—Philadelphia, Automobile Show.

Feb. 4-11—Chicago, National Show, Coliseum.

Feb. 13-18—Detroit, Automobile Show.

Feb. 20-25—Cleveland, Automobile Show. Gray's Armory.

Feb. 27-March 4—Toronto, Automobile Show.

March 6-11—Buffalo, Automobile Show, Convention Hall.

March 13-18—Boston, Automobile Show, Mechanics' Hall.

March 13-18—Boston, Importers' Show, Symphony Hall.

March 27-April 5—Washington, Automobile Show.

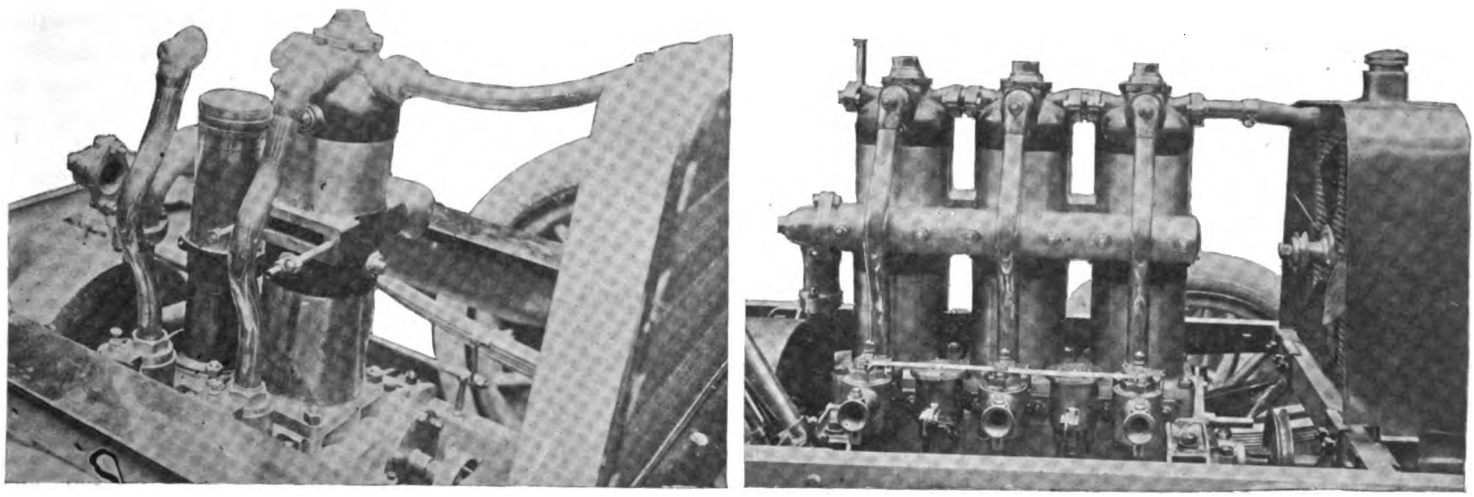
SMALL CARS WERE SCARCE

Few of Them in Evidence at Paris and Not Much Newness in Motors.



Paris, Dec. 16.—Apart from the uniformity of car construction that is apparent, the thing that most strikes the visitor to the Paris Salon is the almost complete absence of small vehicles.

It is true that one comes across a small car now and then; for example, the little car constructed by the Minerva Motors, Limited, of Antwerp, a Belgian concern running with English capital, and also by Gregoire, and perhaps one or two others, but these small cars are entirely swamped in the magnificent display of big vehicles that dazzle in all the brilliance of polished steel under the myriads of incandescent lamps from the glass roof and the beautiful illuminations of the stands. The small car has been getting smaller in numbers with each succeeding show, until now it has become difficult to pick them out in the great display of big vehicles.

The impression obtained by the foreign visitor is that the French makers have given up catering for the huge class, who can only afford to purchase cheap and reliable cars. To a certain extent this is true, but it would be a mistake to suppose that the French makers are no longer looking out for the requirements of the general body of automobile users. In a general way it may be said that the conditions of the automobile industry in France are not altogether favorable to the production of light and cheap cars. In an industry which is developing so rapidly it naturally follows that a large number of new makers are constantly entering the trade, when they start by giving attention to little cars usually built up from parts supplied by different firms, and then, when they start equipping themselves for manufacturing the vehicles themselves, they go in boldly for the bigger cars, with the result that in this country the small car is usually regarded as merely an introduction to the more serious part of the business. So long as the industry is carried out on these lines, it follows that the small car cannot develop so rapidly as it should do, because makers do not bring sufficient experience to bear upon the design and manufacture of these vehicles, so that the unsatisfactory character of the majority of the small cars put on the market is a further reason why makers should turn their attention to the big type of touring car into which French experience has mainly crystalized. Moreover, it seems to be a general rule that the French maker prefers to secure a big profit on a few expensive cars than to content himself with the same return on a heavy production of small and cheap vehicles.

As the French maker thinks he can see greater possibilities of profit in the big car, he seems to regard the small vehicle as a little beneath his reputation, and therefore it follows that in a show which is intended to be a manifestation of the French industry, the big car should almost entirely monopolise attention. As we have said in a previous letter, there is not much novelty observable in the cars themselves. It is only when we take each part of the mechanism, and see the many little changes and improvements, that we can understand the lines upon which the French industry is developing.

A striking feature about the show is that there is much less variety in the motors exhibited than was to be seen on previous occasions. As automobile engineers are gaining in experience they have lived down the freaks which used to make the show so interesting, in the sense that we were able to see how much misdirected ingenuity was being spent upon the designing of motors of every conceivable type that might appear to have some advantage over the four cycle engine. The only two-cycle motors exhibited are the Dobelli, of Italy, and the Rene Legros, which latter certainly possesses some promising features. This engine has one cylinder and two pistons, one of them being fixed. The fixed piston is carried on an arm hollowed out for the passage of the gas mixture from the carburetter to above the fixed piston. Over this piston travels another in the form of a cylinder with a cross head at a point so that it clears the end part of the fixed piston on the upward limit of travel. The cylinder has two very large exhaust ports, and a pipe connects a chamber communicating with the hollow arm carrying the fixed piston with the induction valve on the top of the cylinder. In operation the upward travel of the moving piston draws in a charge of gas up the hollow arm above the fixed piston, where it is compressed on the downward travel. The induction valve is loaded for the admission of the gas at a certain pressure, so that at the moment the moving piston descends and uncovers the exhaust ports the induction valve opens to admit the fresh charge, which expels the burned gas remaining in the cylinder. The great merit of this motor is its complete absence of complication, and it certainly appears to overcome many of the objections that are usually raised against the two-cycle motor.

THE LEGROS TWO-CYCLE MOTOR.

Duhme's Queer Vehicle.

A Cincinnati engineer named John H. Duhme has built a three-wheeled motor vehicle designed for trucking and farm work, and having a number of novel features. Two of the wheels are in the rear and are of the regulation wagon type, with wood hubs and spokes and steel tires. The third wheel is much larger than the other two and is fitted with a pneumatic tire. The power is furnished by a gasolene engine, which is geared to this large front wheel. It is claimed that the vehicle is easy to handle, particularly in congested streets.

Winton to Exhibit in London.

Space in the main hall at the Olympia show, to open in London, England, on February 10, has been secured by the Winton Motor Carriage Company. All the 1905 Winton models will be exhibited there.

A Grand Prize

Has been awarded by the Juries of the
Louisiana Purchase Exposition Co. to

THE GEORGE N. PIERCE CO.

On its exhibit of

Pierce Automobiles

In recognition of superior quality in workmanship and materials, together with correct engineering and design.

The PIERCE Line for 1905 will include

PIERCE Stanhope, 8 H.P. - - $1200

Great Arrow, 24-28 H.P., Side Entrance, $3500

Great Arrow, 28-32 " " " $4000

Dealers can secure this splendid line now for all unoccupied territory and correspondence to this end is solicited.

THE GEORGE N. PIERCE CO., Buffalo, N. Y.

Members of Association of Licensed Automobile Manufacturers.

First of the Four-Cylinder Cadillac Family.

None of the many new and radically differing cars that will mark the 1905 season has been more jealously screened from public view than has the four cylinder Cadillac, the principal specifications of which were exclusively given in last week s Motor World and an illustration of which is here shown. That it would be something more than ordinarily good went almost without saying. The Detroit concern's remarkable success with its single cylinder car, and its reputation for thoroughness, was sufficient guarantee that in departing from its established design and putting forth a multiple, vertical cylinder car it would be seen that it possessed the qualities necessary in an up to date touring car.

When the car itself appears—which will be during the Madison Square Garden show in January—the unusual qualities claimed for it will become apparent. General Cutting, of the local Cadillac company, who returned from a factory inspection last week, gave a Motor World man a glowing account of his first ride in the car. He extolled its entire freedom from noise and vibration and the remarkable flexibility of the engine. Of the latter he said that while on the high speed the engine was throttled down to such an extent that the operator stepped to the ground and jogged along with it, while on resuming his seat he opened the throttle and speeded the car up to in excess of forty miles an hour.

The car is rated at 30 horsepower, and will list at $2,800. It has a wheel base of 100 inches and a length over all of 146 inches. The favorite side entrance body—made either of aluminum or wood—with individual front seats, is used, and is free from tanks and similar encumbrances.

The engine has four vertical cylinders, cast separately with copper water jackets, all joints being ground to take care of leakages. A scored, cracked or injured cylinder can be replaced without the necessity of tearing the engine down, and at a cost of a few dollars for the new cylinder.

An automatic mixing valve supplies the four cylinders with gas of an even temperature by taking warm air from the exhaust. This device has been used for several seasons, and gives a perfect mixture under all conditions and is not affected by changes of weather. It is practically indestructible, and requires only occasional adjustment. An auxiliary air inlet is provided, which operates at the maximum engine velocity.

The engine is controlled by a hydraulic oil governor, gear driven, operating upon a variable inlet valve. The speed of the engine increases the pressure of oil in the governor, which correspondingly increases the opening of the inlet valve, thus admitting a greater quantity of gas.

Lubrication of the engine is by a gear driven pump, forcing the oil through one central pipe line, from which each cylinder receives its oil through a branch line. Only one sight feed is provided, the adjustment of which supplies each cylinder equally. Each cylinder receives its given amount of oil regardless of the grade percentage, by having a series of bridges in the engine frame to prevent the oil from flowing to either end.

The crank shaft is supported on five main bearings of white metal and bronze, with a ingenious arrangement for oiling them.

The transmission gives three speeds forward and reverse, with the direct drive on high speed, transmitting the power to the rear axle by a ball bearing shaft drive. The gears are cut from drop forged steel blanks, and can withstand the shock of changing from direct drive to reverse when going at the speed of fifty miles an hour. Absolute silence in operation is secured through accuracy in cutting the teeth and providing a permanent bath of oil.

All speeds are operated from one lever, thereby securing a remarkable ease in handling. By applying the foot brake the clutch in the flywheel is released, the engine immediately diminishing its speed automatically. In an emergency the reverse can also be used as an additional brake.

The transmission is coupled to the flywheel by means of leather faced duplex disks with adjustable springs between. The springs permit of the clutch engaging more slowly and with greater ease, thereby avoiding too sudden and unnecessary strains on the motor.

Both the engine and transmission are kept in permanent and perfect alignment by hanging each to two pieces of heavy steel tubing running parallel with the pressed steel frame. This tubing is set in a cross frame of pressed steel and held in place by four bolts. The

Digitized by Google

ease with which the engine and transmission can be moved from the chassis is obvious when it is only necessary to first remove these four bolts.

The rear axle receives its power through a bevel gear and shaft drive.

The dash is made of aluminum, in which is formed a five-gallon gasolene tank, fed from a large reserve tank in rear of car. A glass gauge is provided, showing at all times the quantity of gasolene in tank. There is also an oil reservoir in the dash with sufficient capacity for a thousand-mile run.

Boston to Have a New Club.

Due largely to the influence of the rather exclusive policy of the Massachusetts Automobile Club came into being on Thursday of last week at the offices of the Columbia Motor Vehicle Co., on Stanhope street.

The prime movers were W. W. Burke, manager of the Columbia M. V. Co.; Harry Fosdick, A. E. Gilmore, of the Rambler branch; Underhill, of the Reed-Underhill Co. H. L. Bowden, one of the Bay State's few real democratic millionaires, and a number of others more or less prominent in Massachusetts automobile circles, who by their presence or letters lent hearty support to the movement.

Active steps will be taken at once to place the club on a sound footing, and from present indications the movement is assured of active support throughout the State.

One of the first matters to be taken up will be the agitation of a uniform State ordinance permitting a speed of twenty miles an hour outside of city limits.

The Fairy Tale of Four Drummers.

According to St. Louis (Mo.) newspapers, the utility of the automobile for the use of commercial travellers has been recently established by a test conducted "under the auspices of the Travellers' Protective Association." Four "drummers" of that city are alleged to have made a four days' trip in an automobile between Flora, Ill., and East St. Louis, during which they are said to have covered 385 miles at a total cost for repairs to the car of $1.85. Unfortunately, however, when the Motor World's St. Louis correspondent attempted to verify the story, he was told by the secretary of the Travellers' Protective Association that the test had not been made under the auspices of the organization, and that he did not know any of the four men who made the trip. Only one of the men had his name in the city directory, and he has left the firm he had been with and they did not know his present location.

Not "Farm Implements," Say Farmers.

Farmers of Ingham county, Mich., want automobiles insured. They have asked the Ingham County Farmers Mutual Insurance Company to class them, not as farm implements, but with other vehicles standing in the barn of the insured. The matter came up at the annual meeting of the company, and was referred to the executive committee.

SALTS TO PREVENT FREEZING

Souther Takes a Strong Stand Against Them and Explains the Mischief They Make.

During the last few years very many of those who make and those who use automobiles have been using calcium chloride very successfully to prevent freezing in the cooling systems, and because no outward indication of injury has shown itself these men believe that the chloride or any other salt is harmless.

The case is not unlike that of the water companies, whose pipes are subject to electrolytic action. Some of these companies believe that they are escaping the inroads of electrolysis by some marvellous good luck or some condition entirely different from other companies. They have attributed leaks in service pipes, shut-off valves and connections in general to ordinary wear and tear, until finally some investigating mind began to examine more closely. The result of such examination has usually shown that even the heavy cast iron pipes are found to be slowly disintegrating; some of them it is possible to cut with a knife, nothing but the graphite of the cast iron being left.

An automobile is not wholly dissimilar. The manufacturers may have thought that the leaks in elbows, or connections that did develop, if such did develop, were nothing more or less than ordinary deteriorations. They may not have kept the cars in their possession long enough to develop any injury. The cars have, doubtless, passed into the hands of unsuspecting purchasers, and they will get the results of the slow but sure electrolysis that has been taking place.

Immediate destruction of radiator, elbows, unions and metals coming in contact with the electrolyte is not probable. It takes time to dissolve metal in this way, but that it does dissolve is as sure as fate.

Take such a combination of metals as a radiator, for example, delicate and efficient—efficient because it is delicate, made up of copper, brass, solder, connected with iron or steel pipes, which, in turn, may be connected with a cast iron engine. All of these metals are either positive or negative to one another. This means that one of them gives and the other takes. The metal in the cooling coil is not thick enough to stand very much giving up, and is sure to be injured in a season or two.

One of the first questions that the writer would ask if he were purchasing a second-hand machine would be, "Have you ever used in your cooler any salt to prevent freezing?" Were the question answered in the affirmative, the writer would say positively that he would not consider the purchase of that machine. Even though the machine were perfect in every joint with no sign of leak in the cooling system, there would be no assurance that leaks would not develop within a short period.

The writer reaps no benefit from urging the use of alcohol and glycerine or a combination of both, but is merely taking this position to keep purchasers and users of automobiles out of trouble. A delicate machine like an automobile has ills enough of a legitimate kind; there is no use manufacturing other kinds.

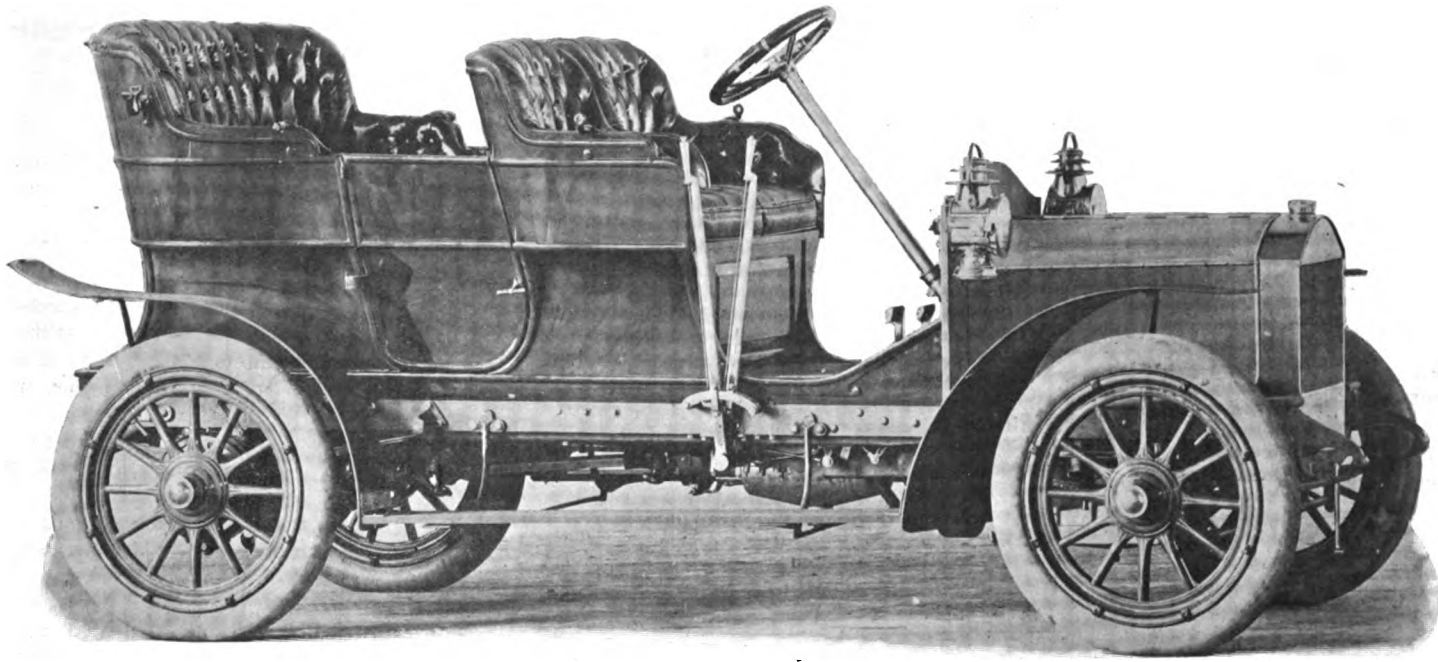
HENRY SOUTHER.

Y. M. C. A. Enlarges its Usefulness.

Boston's Y. M. C. A. automobile night school, which is now in its third succesful year, is to be supplemented by the institution of a day class. This was first talked of several weeks ago, and the project met with such a favorable reception that it has been decided to go ahead with it. Accordingly the advisory board of the school has made the following announcement:

"The school will be in operation throughout the entire year for private instruction, special arrangements having been made for private instruction for ladies at hours which will suit their convenience. This department has been placed in charge of a thoroughly competent man of excellent reputation. A day school for business men has been established, and will open on Monday, January 2, at 4:30 p. m., the steam course meeting on Monday and Thursday afternoons, and the gasolene course on Tuesday and Friday afternoons from 4:30 to 6 o'clock. These classes will be held in the Park Square Automobile Station, in Columbus avenue. Additional arrangements have been made for road and driving lessons, and those desiring instruction in any particular car will be able to secure special instruction."

The attendance upon the school this year is very large, and exceeds that of last year. Many have entered whose homes are in distant cities, Omaha, St. Louis, Pittsburg, Chicago and many others from New England and adjoining States.



The association has established a registration bureau for chauffeurs in connection with its employment department, and special facilities will be offered to men desirous of securing chauffeurs' positions with the opening of the season. A large amount of additional apparatus and several cars have been secured for the gasolene course, and every effort will be made to increase the amount of practical instruction.

To Test Accessibility of Parts.

It is proposed by Les Sports, a new French journal, to promote a series of novel competitions, beginning in February next. The competitions will have for an object the demonstration of dismounting various parts of a motor car. An official timekeeper will stand ready, and the judge will say to the competitor, "Give me the exhaust valve, take out the float of the carburetter," etc. The ease with which such organs are detached and replaced is a matter of importance to motorists, and these original trials will undoubtedly prove of great service.

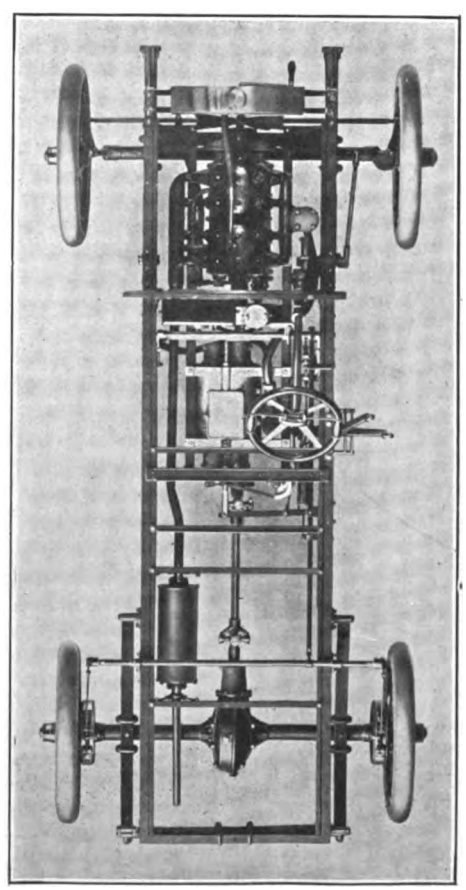
Here's the Long Looked-for Four-Cylinder Autocar.



Among the concerns known to be preparing to launch a four cylinder car in 1905 was the Autocar Co., Ardmore, Pa. The reputation of the Pennsylvania concern for clever designs and sound and ingenious construction is such that an exceptionally fine creation was confidently expected, and the accompanying illustration makes it clear that, so far as appearance goes, this expectation has been quite fulfilled. The mechanical excellence of the car becomes apparent as it is examined in detail.

This four cylinder car, which is styled Type XI, will constitute one of three Autocar models that will be marketed in 1905. The two companion vehicles are models that have been marketed this year, viz., Type X, the two passenger runabout, at $900, and Type VIII, the four passenger tonneau listing at $1,400. The latter are offered in an unchanged form, their remarkable success during the last season having demonstrated conclusively that they would prove almost equally popular in 1905.

The Type XI Autocar is a contribution to that rapidly growing class of medium powered and priced cars that have of late become a marked feature of the American industry. They mark the acceptance by American makers of the European theory of design—a car driven by a four cylinder vertical engine, placed in front under a bonnet and transmitting the power preferably through sliding gears and either a propeller shaft and bevel gear to a live rear axle, or by double chains direct to the rear wheels. In the case of the Autocar, it is the shaft and gear drive type of transmission that is used. At the same time the European design has not been slavishly copied; there are many evidences of the originality and ingenuity that have always distinguished Autocar product. The rated horsepower of Tyxe XI is 16—20, the weight 1,900 pounds, the price $2,000. The body is of the popular side entrance type, with tonneau in the rear, the latter designed to carry three passengers or a total of five. Deliveries will begin to be made January 16

The chassis consists of an armored wood frame—a pressed steel section with a wood lining—mounted on semi-elliptic front springs 34 inches long and 2 inches wide, and on rear platform springs, consisting of side springs 35x2 inches and a rear spring 54x2 inches. The whole is imposed on four twelve spoke Mi lgely steel wheels, 30 inches in diameter. These wheels are fitted with 3½-inch Fisk heavy tires. The wheel base is 96 inches and the tread 54 inches. This combination makes an unusually comfortable riding car, peculiarly adapted for use on rough roads.

AUTOCAR CHASSIS.

The front axle is of 2¼-inch steel tubing, while the live rear axle is made of 1⅜-inch solid steel, with squared ends at the wheels obviating the use of keys. The rear axle case, which contains the bevel gear differential, is in three parts, bolted together, the top portion being removable so that the entire case and gears are visible and accesible.

The power plant consists of a four-cylinder vertical engine, water cooled, placed in front under a hood. The cylinders are cast in pairs and have a 3½-inch bore and a 4-inch stroke. The inlet and exhaust valves are mechanically operated and interchangeable. All valve gears are encased. The long engine bearings are bolted to the upper half of the crank case, the lower half being removable without interfering with the bearings. Lubrication is by splash and continuous force feed from a gear-driven oil pump. Engine and transmission are on the same pressed steel cradle, and protected by a motor shield.

Three speeds forward and reverse are given by the well known Autocar type of sliding gears, the latter being strong and having very broad faces; they are cut from drop forged steel, hardened, and the shafts are carried on generous sized roller bearings. From these sliding gears a propeller shaft and bevel gear drive transmits the power to the live rear axle.

On each hub is a band brake, and on the driving shaft at the rear of the transmission case is the emergency brake. A foot lever

Digitized by Google

controls the hub brakes, a side hand lever the emergency brake. The first effect of moving the emergency brake lever is to throw out the clutch, the emergency brake and clutch being interlocked.

The control is on the right hand side of the car. A wheel steer is used with bevel gear and sector. The spark and throttle control handles are in the rim of the wheel. A foot operated clutch is used, and the clutch pedal is controlled by the left foot. When it is desired to hold the clutch disengaged, a clutch holdout may be operated by moving the foot slightly to one side of the pedal so as to remove the foot pressure from the clutch holdout button, and the car left standing without having to shift the gears to their neutral position. This clutch holdout is instantly released when it is desired to again start the car by simply pressing the foot on the clutch pedal as a whole.

Unusually large radiating surface is secured by a special coil radiator, with horizontal tubes and fins placed above the frame. Back of the radiator is a fan, around which is no housing to interfere with the natural draft produced by the car in motion.

A single vaporiser of the float feed type, the Autocar Co.'s own design, is used.

The ignition apparatus consists of two batteries of dry cells wired to a four-point coil with gear driven, spark timer mounted on the dashboard and in full view of the operator. Ignition is by jump spark.

All cardan cross caps, dust caps on transmission case and other similar parts requiring locking, are held in position by an ingenious spring pin, that cannot work out, become loose, shear off or break. Each cardan cross cap is also clamped by a bolt to the yoke.

Only a few minor parts are oiled directly. The engine is lubricated by splash and continuous force feed of oil by a gear driven oil pump. Transmission and rear drive are oiled by splash lubrication.

Large bearings, designed to run with a minimum friction, are everywhere fitted. The engine bearings, for example, being from 3 inches to 3½ inches. The engine, steering knuckles and steering posts have bushings, while the transmission, rear drive and rear and front wheels have roller bearings.

The equipment consists of two front oil lamps, one tail oil lamp, horn, tire repair outfit and tools and storm apron.

Car for St. Louis's Fire Chief.

St. Louis, Mo., has voted $2,000 for the purchase of an automobile for the use of Charles E. Swingley, the chief of its fire department. The fact that the city is spread over a wide area, being six miles wide and having a river front of about twenty miles, and that several long runs had ruined the chief's horses, influenced the City Fathers in authorizing the purchase. The police department of St. Louis has had an automobile patrol wagon in use for some six months.

BENNETT RULES UNCHANGED

Cup Commission Votes Down Proposed Alterations but Defines Light and Heavy Cars.

After all the talk about changes in the rules governing the Bennett Cup race, it has been decided to conduct it, in 1905 at any rate, without change of any kind. This conclusion was reached on December 12, when the International Commission, to which had been intrusted the management of the Bennett Cup race, met in conference at the headquarters of the Automobile Club of France, in Paris. Eighteen delegates attended, France being represented by Baron de Zuylen, the Marquis de Dion and the Chevalier Rene de Knyff.

The broad lines on which the next cup race will be arranged were decided. The conference agreed that the race shall be run under the same regulations as last year. The proposals for reducing the weight-limit of cars, for a team contest, for a two days' race over 1,000 kilometres, and for allowing only a fixed number of tires and covers to competitors, were discarded. It was decided that the great annual contest shall always be held in the last week of June, or as nearly as possible to that date.

The contest of next June will be competed for under exactly the same regulations as before. The suggestion of a two-days' race over double the distance was impracticable, while the reduction of the weight limit would have increased the danger of the contest.

Other decisions arrived at by the conference were that henceforth only one club in every country will be officially recognized, that in future danger and caution signals shall be blue and yellow, instead of red and green (the German Government have prohibited the latter colors because of their use on railways), and that due notice of all exhibitions and sporting events shall be given by each club to all the others to avoid clashing.

After discussion, the classification of cars by weight already established was officially adopted for all countries save Belgium, which accepted it only provisionally. Henceforth, accordingly, the term "car" will invariably mean a car weighing over 650 kilos. (1,432 pounds), and a "light car" one under that figure, while the limit for motor-cycles is fixed at 50 kilos. (110.23 pounds). The rule of a 7 kilos. (15.4 pounds) in favor of cars and 3 kilos. (6 pounds 9¾ ounces) for motorcycles when magnetos are used instead of accumulators, will now be ocffially binding in all contests.

A proposal to appoint an international committee for all sporting events was shelved, and another to create an international sign to be carried on motor cars for the purpose of identifying lawbreakers was dropped as being impracticable.

Questions relating to customs formalities were discussed, but nothing was agreed to.

Preparing for Bennett Cup Race.

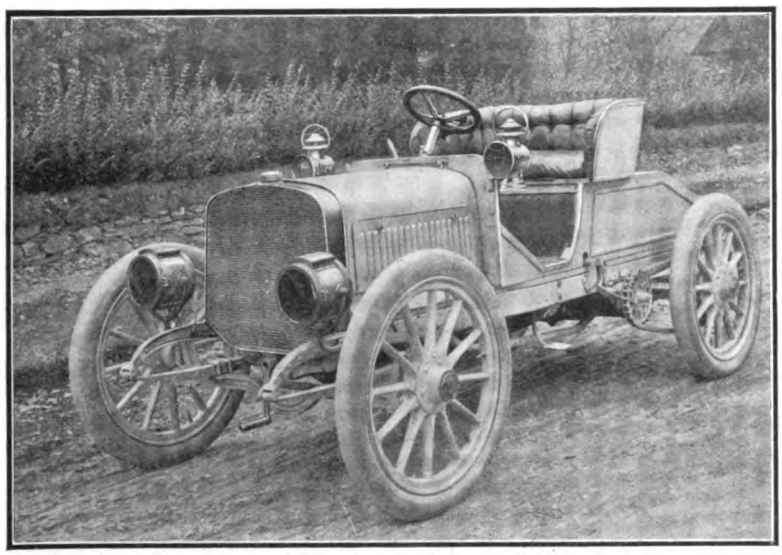
Notwithstanding the talk of the limits of power and speed having been reached in the races of the past, makers are preparing for the 1905 Bennett Cup race cars that will far exceed in the respects mentioned any cars yet produced. France, Germany and England are the leaders in this movement, nearly half a hundred cars being under way in the first named country alone. Few of the cup cars will be rated at less than 100, and some of them will go as high as 150 H. P.

Following are the firms which are so far reported as definitely building cup cars, together with the number of cars and their horsepower:

Makers.	Cars.	H.P.
Richard Brasier	3	110
Mors	3	130
De Dietrich	3	120
Darracq	3	140
Gobron-Brillie	3	150
Renault	3	90
La Buire	2	120
Rochet-Schneider	2	120
Panhard	3	120
Turcat-Mery	3	120
Bayard-Clement	3	120
Hotchkiss	3	150
Gardner-Serpollet	3	—
Delaunay-Belleville	2	120
Berliet	2	130
Boyer	2	120

The question of the nationality of the drivers has now cropped up in France in several quarters. In all probability foreign drivers will only be permitted to drive in the French Eliminating Trials, provided they have been resident on French soil for not less than two years immediately preceding the date of this trial. From the commencement it has been strenuously urged that it should be imperative that drivers in the cup race should be of the same nationality as the cars which they drive. In any case it is suggested in France that any driver who is entered for driving a cup car in the Eliminating Trials for any other country should not be allowed to drive in the French Eliminating Trials.

For the English Selection Trials four makers have announced their intention of competing, viz., Napier, Wolseley, Siddeley and Star. For these trials an entrance fee of $500 must be paid, which is under no circumstances returnable. Beyond this fee a deposit of $500 must be made as a guarantee of compliance with the regulations of the A. C. G. B. I., this fee being returnable under certain conditions after the winner of the 1905 race has been declared. Entries and fees must be received before noon, December 31. In the event of the car presented for examination to the races committee being found not to be a bona fide racing car, the $500 deposit may be forfeited, as also in the event of an entered car not being at the starting point ready to start for the race, or following disqualification of a car by the International Commission.



The number of automobiles in use in Belgium has progressed by large strides. In December, 1901, there were 1,332 cars; in 1902 the number had increased to 1,991, and in 1903 there were 2,618. This year the licenses show 3,698, which is 2,366 more than in 1901. These figures do not include motorcycles, of which there are considerably over four thousand.

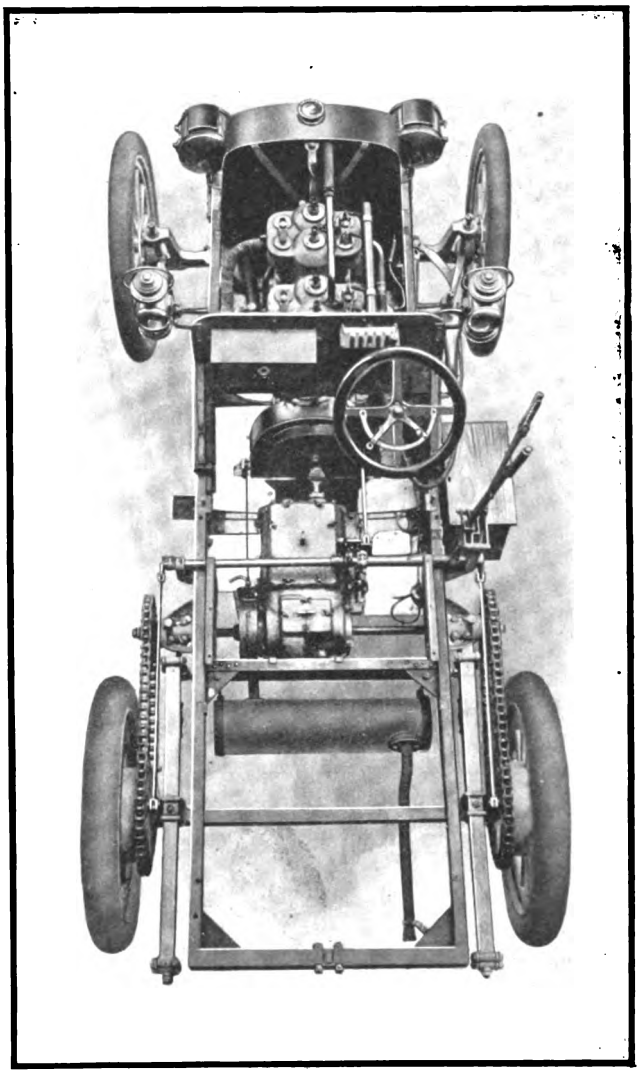
LOZIER'S CAR READY

Proves to be an Attractive Creation, Showing Skill and Close Study of the Subject.



After twenty-three months of trial and preparation, the Lozier automobile is now ready for uncovering. As the Motor World forecasted, it is a 30—35 horsepower touring car, and in every way worthy of its name; it reflects the skill and long experience of its makers, the Lozier Motor Co., New York, whose gas engines and motor boats are well known to the world.

LOZIER CAR WITH TESTING BODY.

INLET SIDE OF LOZIER ENGINE.

PLAN VIEW WITH GASOLINE TANK REMOVED.

The motor is of the vertical four cycle type, having four cylinders, cast in pairs, and bolted to an aluminum crank case.

The valves are mechanically actuated—inlet on one side and exhaust on the other—and are easily accessible by removing one nut and strap for each pair. Valves, springs and lifters are all interchangeable. Material of valves is a nickel-steel composition with low co-efficient of expansion, thus minimizing distortion. Area of valves and shape of ports are such as to insure easy entrance and exit for gases, thereby gaining in efficiency.

The cam shafts are direct driven (without intermediate gears), by steel pinion on crank shaft meshing in with large combination fibre and bronze gears—a noiseless and durable transmission.

The cams and valve lifters are inclosed in small chambers in communication with the main crank chamber, receiving splash lubricator therefrom. Readily removable aluminum covers afford an easy entrance to these chambers.

The crank shaft is made from mild open hearth steel forging—30 point carbon—with liberal sibe zearings. Crank pins are hardened and ground in a special machine built for this purpose, which is, so far as is known, the only machine of its kind in existence.

All reciprocating and rotating parts are as light as possible and perfectly balanced, insuring a quiet and smooth running machine.

Jump spark ignition is used in connection with a high tension magneto, or with storage batteries and induction coil, as desired.

Speed control is secured by spark and throttle levers accessibly located on the top of the steering wheel. The motor is fitted with an automatic carburetter.

Honeycomb radiator, with fan and gear driven centrifugal pump, make up the cooling system.

The clutch is of the leather cone type, with self-contained thrust, fitted with springs under leather to afford advantage of easy engagement. The clutch cone is easily removable for renewal of leather without disturbing the motor or gear case.

The flywheel is inclosed in an aluminum pan, which forms a connecting member between the motor and gear case, which, with an interediate shaft fitted with universal joints between engine and clutch and gear

Digitized by Google

case, together with the manner of suspension, insure against cramping of bearings due to twisting of frame members.

The car has three speeds forward and one reverse. The direct drive is on the highest gear to cross sprocket shaft, with counter shaft in gear case idle. All speed changes are made with one lever, which it is impossible to move until the clutch is thrown out. Both shafts of the gear case are nickel steel and run in ball bearings. The gears are hardened and have teeth of 6-inch cut to a formula which gives a much stronger tooth outline than regularly used. The drive is by two chains to rear wheels from cross differental shaft, which runs in ball bearings.

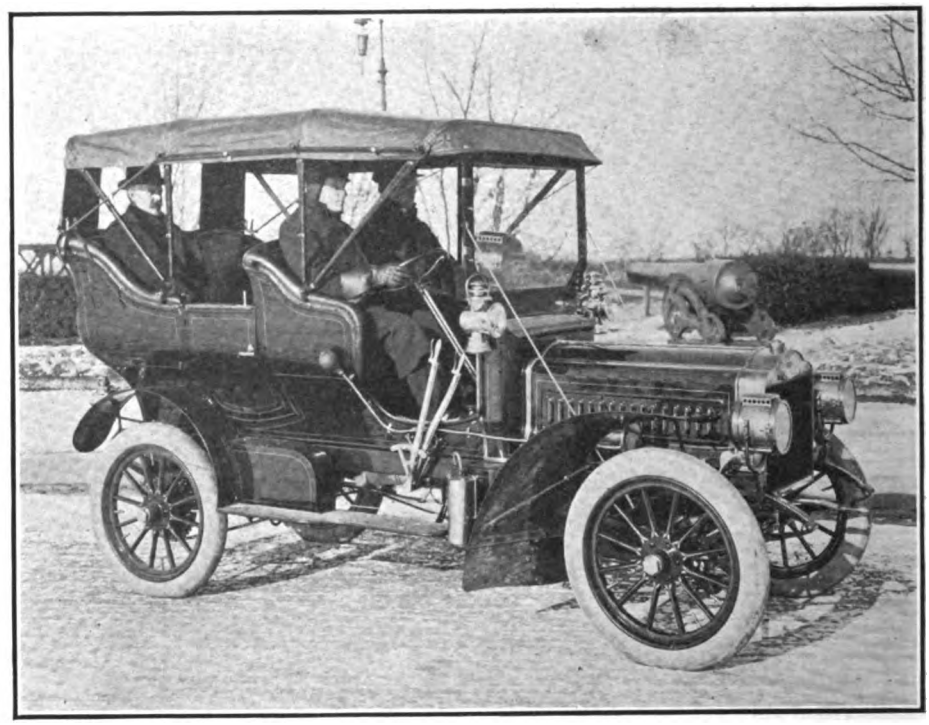
There are two brakes. On differential shaft, a metal to metal brake applied by means of foot pedal; this brake has an easily renewable sheet brass shoe. Rear wheel brake is of the expanding type, disengages the clutch, being interconnected therewith. The emergency brake is not thus interconnected, which fact permits of using the motor (connected to low gear) as a brake, in addition to the emergency brake, in descending very steep hills. The chances for skidding are lessened on greasy downhill travelling when using the motor for brake alone.

The wheel base is 115½ inches for side entrance tonneau. The axles are of I-beam sections, made of nickel steel forgings. The springs are 38x1¾ front and 42½x2 rear. The wheels are 36-inch, with ball bearings front and rear; tires, 4½ inches.

The car is fitted with an aluminum body, and the upholstery and beauty of finish and equipment is in keeping with the general high class construction. The weight of the car complete is 2,500 pounds, and the price, approximately, $5,000, carrying according to style of body desired.

Beginning Made in Bogota.

"Last week the first automobile made its appearance upon the streets of Bogota, and the excitement was unparalleled," says Alban G. Snyder, American Consul General at that point, in a report dated October 24. "Crowds have blocked the highways for squares, rendering traffic almost impossible, and great interest has been aroused as to the possibilities that this mode of transportation may offer in the future.



"This automobile is an American machine, and some business may result from the present enthusiasm. I shall be pleased to receive catalogues from automobile manufacturers of the United States for filing in the reading room here.

"It is rumored that a concession is shortly to be given to a transportation company for the exclusive use of the Camboa road, which leads from the upper Magdalena River to Bogota. Automobiles are to be used exclusively by this company."

Three Champaign, Ill., men, named Wallace, Gulick and Brown, have built an automobile and will test it in a few days. If it should prove successful, they expect to organize a company to undertake the manufacture of similar cars.

Sprague's Newest Top.

To their already great diversity of canopies and other carriage tops the Sprague Umbrella Co., Norwalk, Ohio, have added the extension top, here shown, as applied to a Thomas touring car. When the curtains are put on they inclose the car entirely, making it waterproof. Without removing any bolts or hooks, the top can be brought back and unhooked from the front seat and hooked in a receptacle on the back seat and folded there, making a complete dust shield; the bows fold snugly and lodge in a receptacle on the top of the back seat, where they are strapped in so that they cannot rattle or be shaken out. When this is done the glass front is stationary and forms a good wind break. By removing four bolts the canopy can be taken off the car in a few moments and replaced as soon, or by removing four bolts the whole top can be taken off the car, leaving nothing but the stubs, which are not unsightly or in the way.

SPRAGUE EXTENSION TOP APPLIED TO A THOMAS CAR.

Why Rims Merit Attention.
